**KM3NeT**

# 3D Neutrino Event Display RainbowAlga.jl

JuliaHEP 2024 - CERN  
1. October 2024

**Tamas Gal – Erlangen Centre for Astroparticle Physics**

<https://indico.cern.ch/event/1410341/contributions/6143182/>

# What is KM3NeT?

- A **Cherenkov-based neutrino telescope**
- Located in the deepest seas of the Mediterranean (up to **3.5km deep**)
- Once completed, the telescope will have detector **volumes** of several **cubic kilometres** of clear sea water
- Per detector block **115 vertical strings** (up to 800m long) holding **18 digital optical modules (DOMs)** containing **31 photomultiplier tubes (PMT)** each
- A total of **64170 PMTs per detector block]**
- Sub-nanosecond time-resolution of photons
- Down to **1 milliradian** (~0.05 degrees) **angular resolution** for reconstructed events

|                           | ORCA    | ARCA    |
|---------------------------|---------|---------|
| String spacing            | 23m     | 90m     |
| Vertical spacing of DOMs  | 9m      | 36m     |
| Depth                     | 2470m   | 3500m   |
| Building Blocks (Strings) | 1 (115) | 2 (230) |

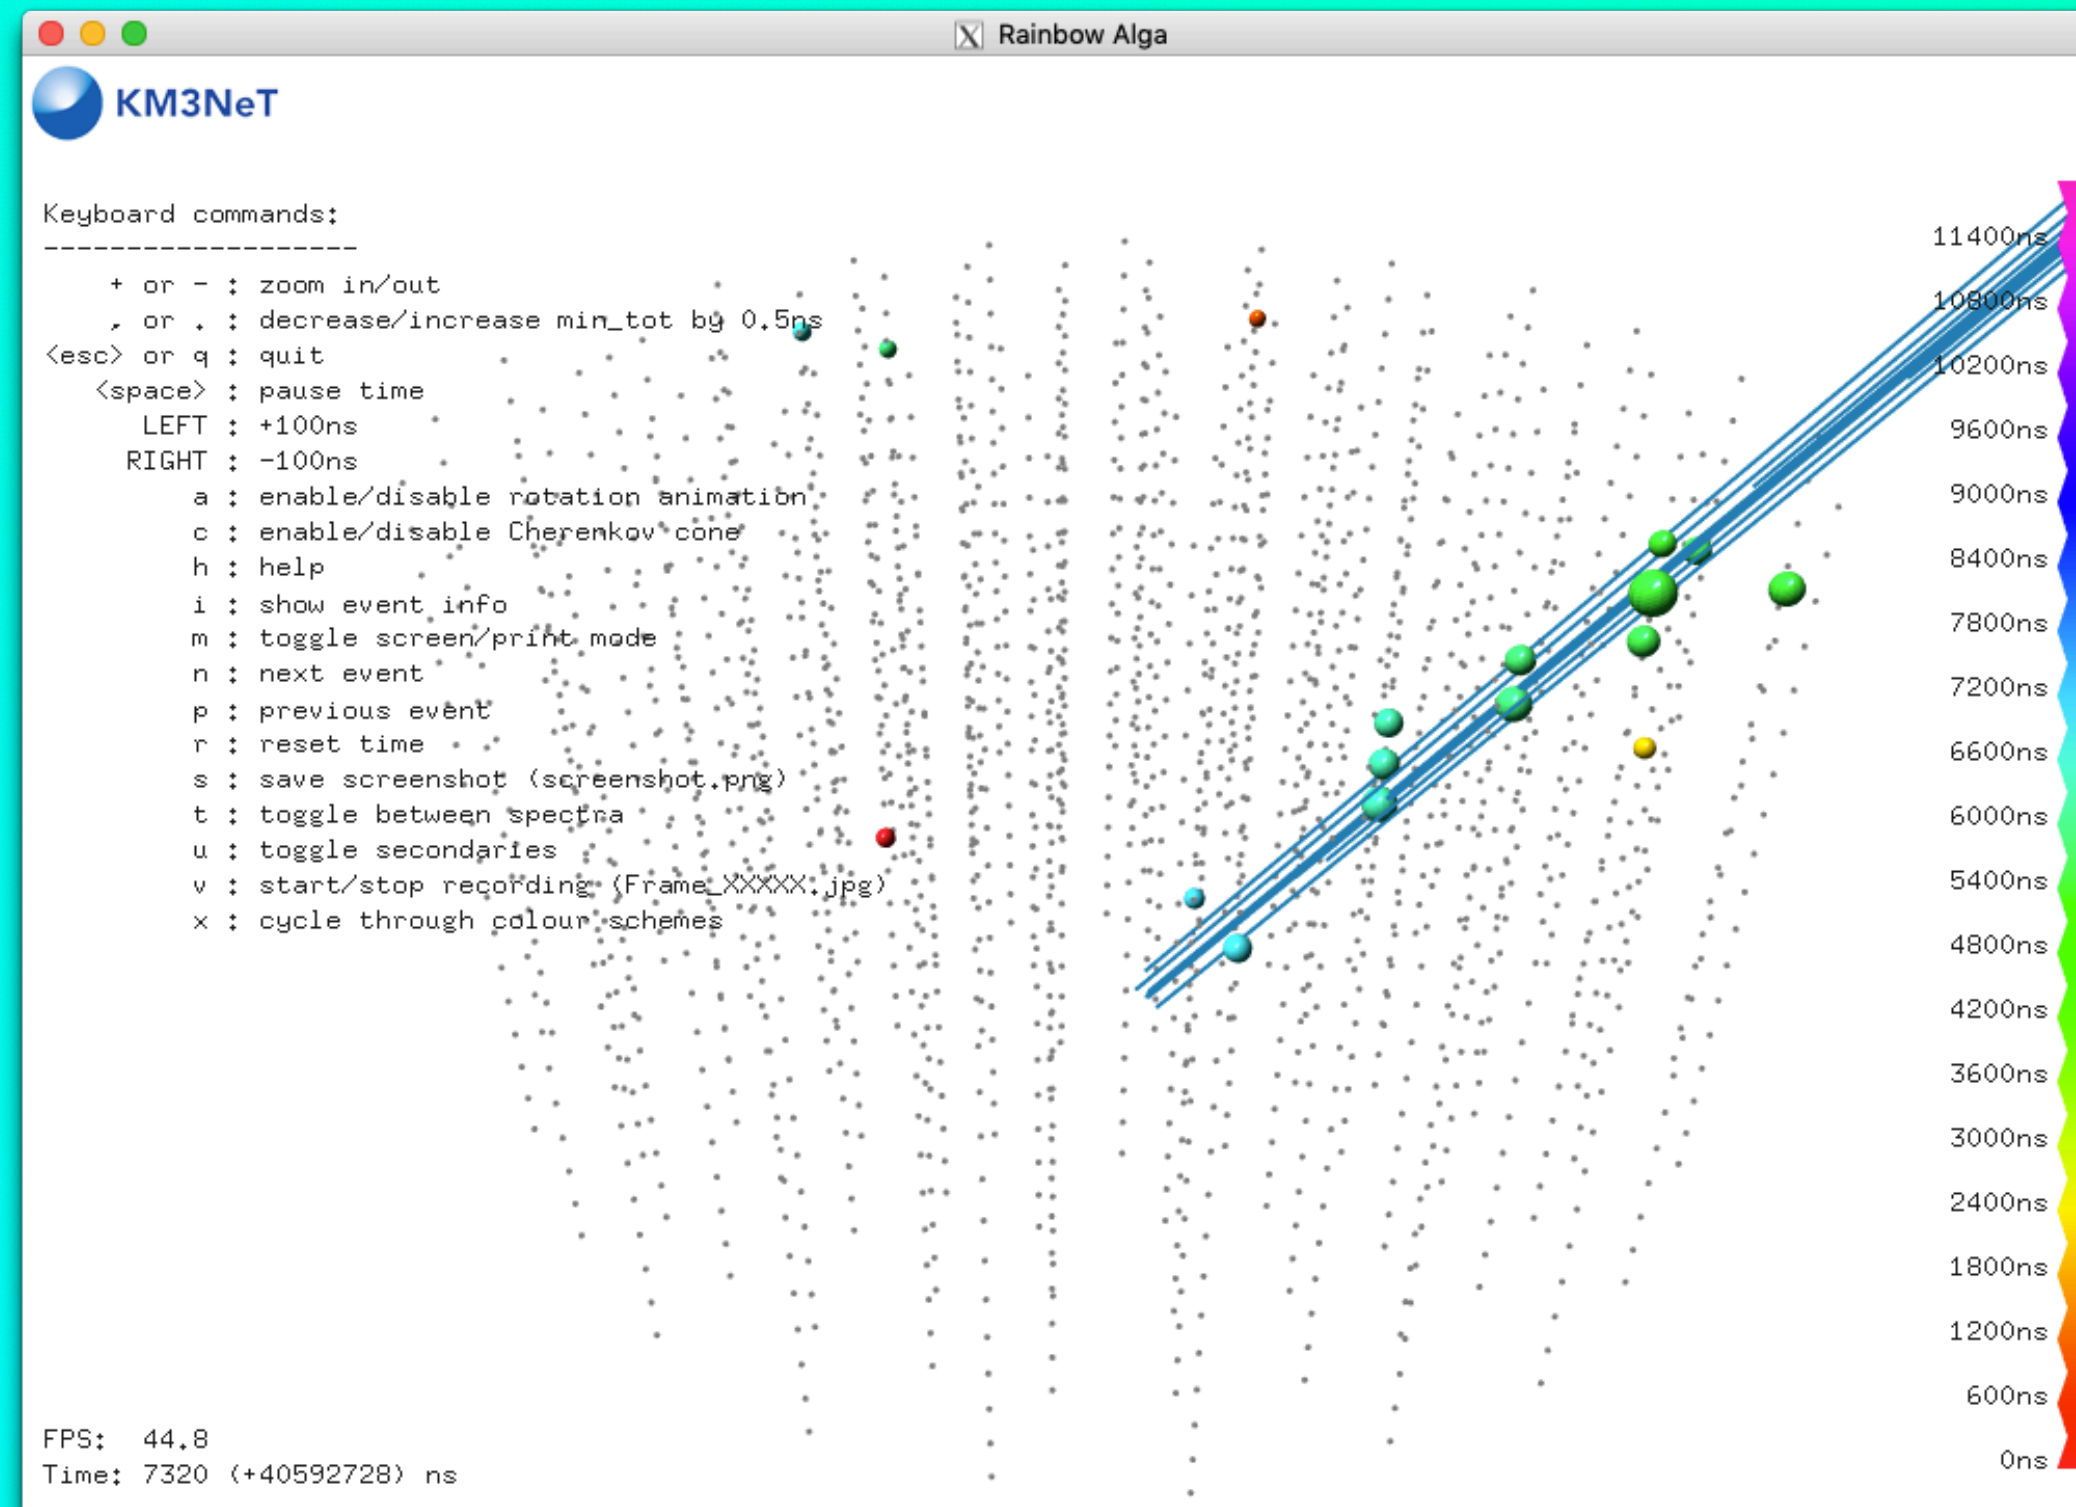

# What is KM3NeT?

# 3D Displays in KM3NeT

Written in pure Python, based on PyOpenGL  
Slow, limited functionalities, not scriptable.

JavaScript (WebGL), has a nice GUI but not easy to use.  
Requires ROOT -> JSON conversion, not scriptable.

# RainbowAlga.jl

- A **pure Julia** package based on **(GL)Makie.jl** and **GLFW.jl** to visualise events in 3D in an interactive way
- **Currently only** working with **KM3NeT** data (several ROOT formats and custom detector geometry and calibration dataformats)
- Can **easily be modified** to work with other **similar experiments** like IceCube, P-ONE, Antares, Baikal(-GVD), TRIDENT, NEON etc.
- The aim is to give the user full programmatic access to the actual scene
- **<https://git.km3net.de/tgal/RainbowAlga.jl>**  
(mirror on **<https://github.com/tamasgal/RainbowAlga.jl>** if you want to collaborate)
- **Special thanks to Simon Danisch** (main developer) for support : )

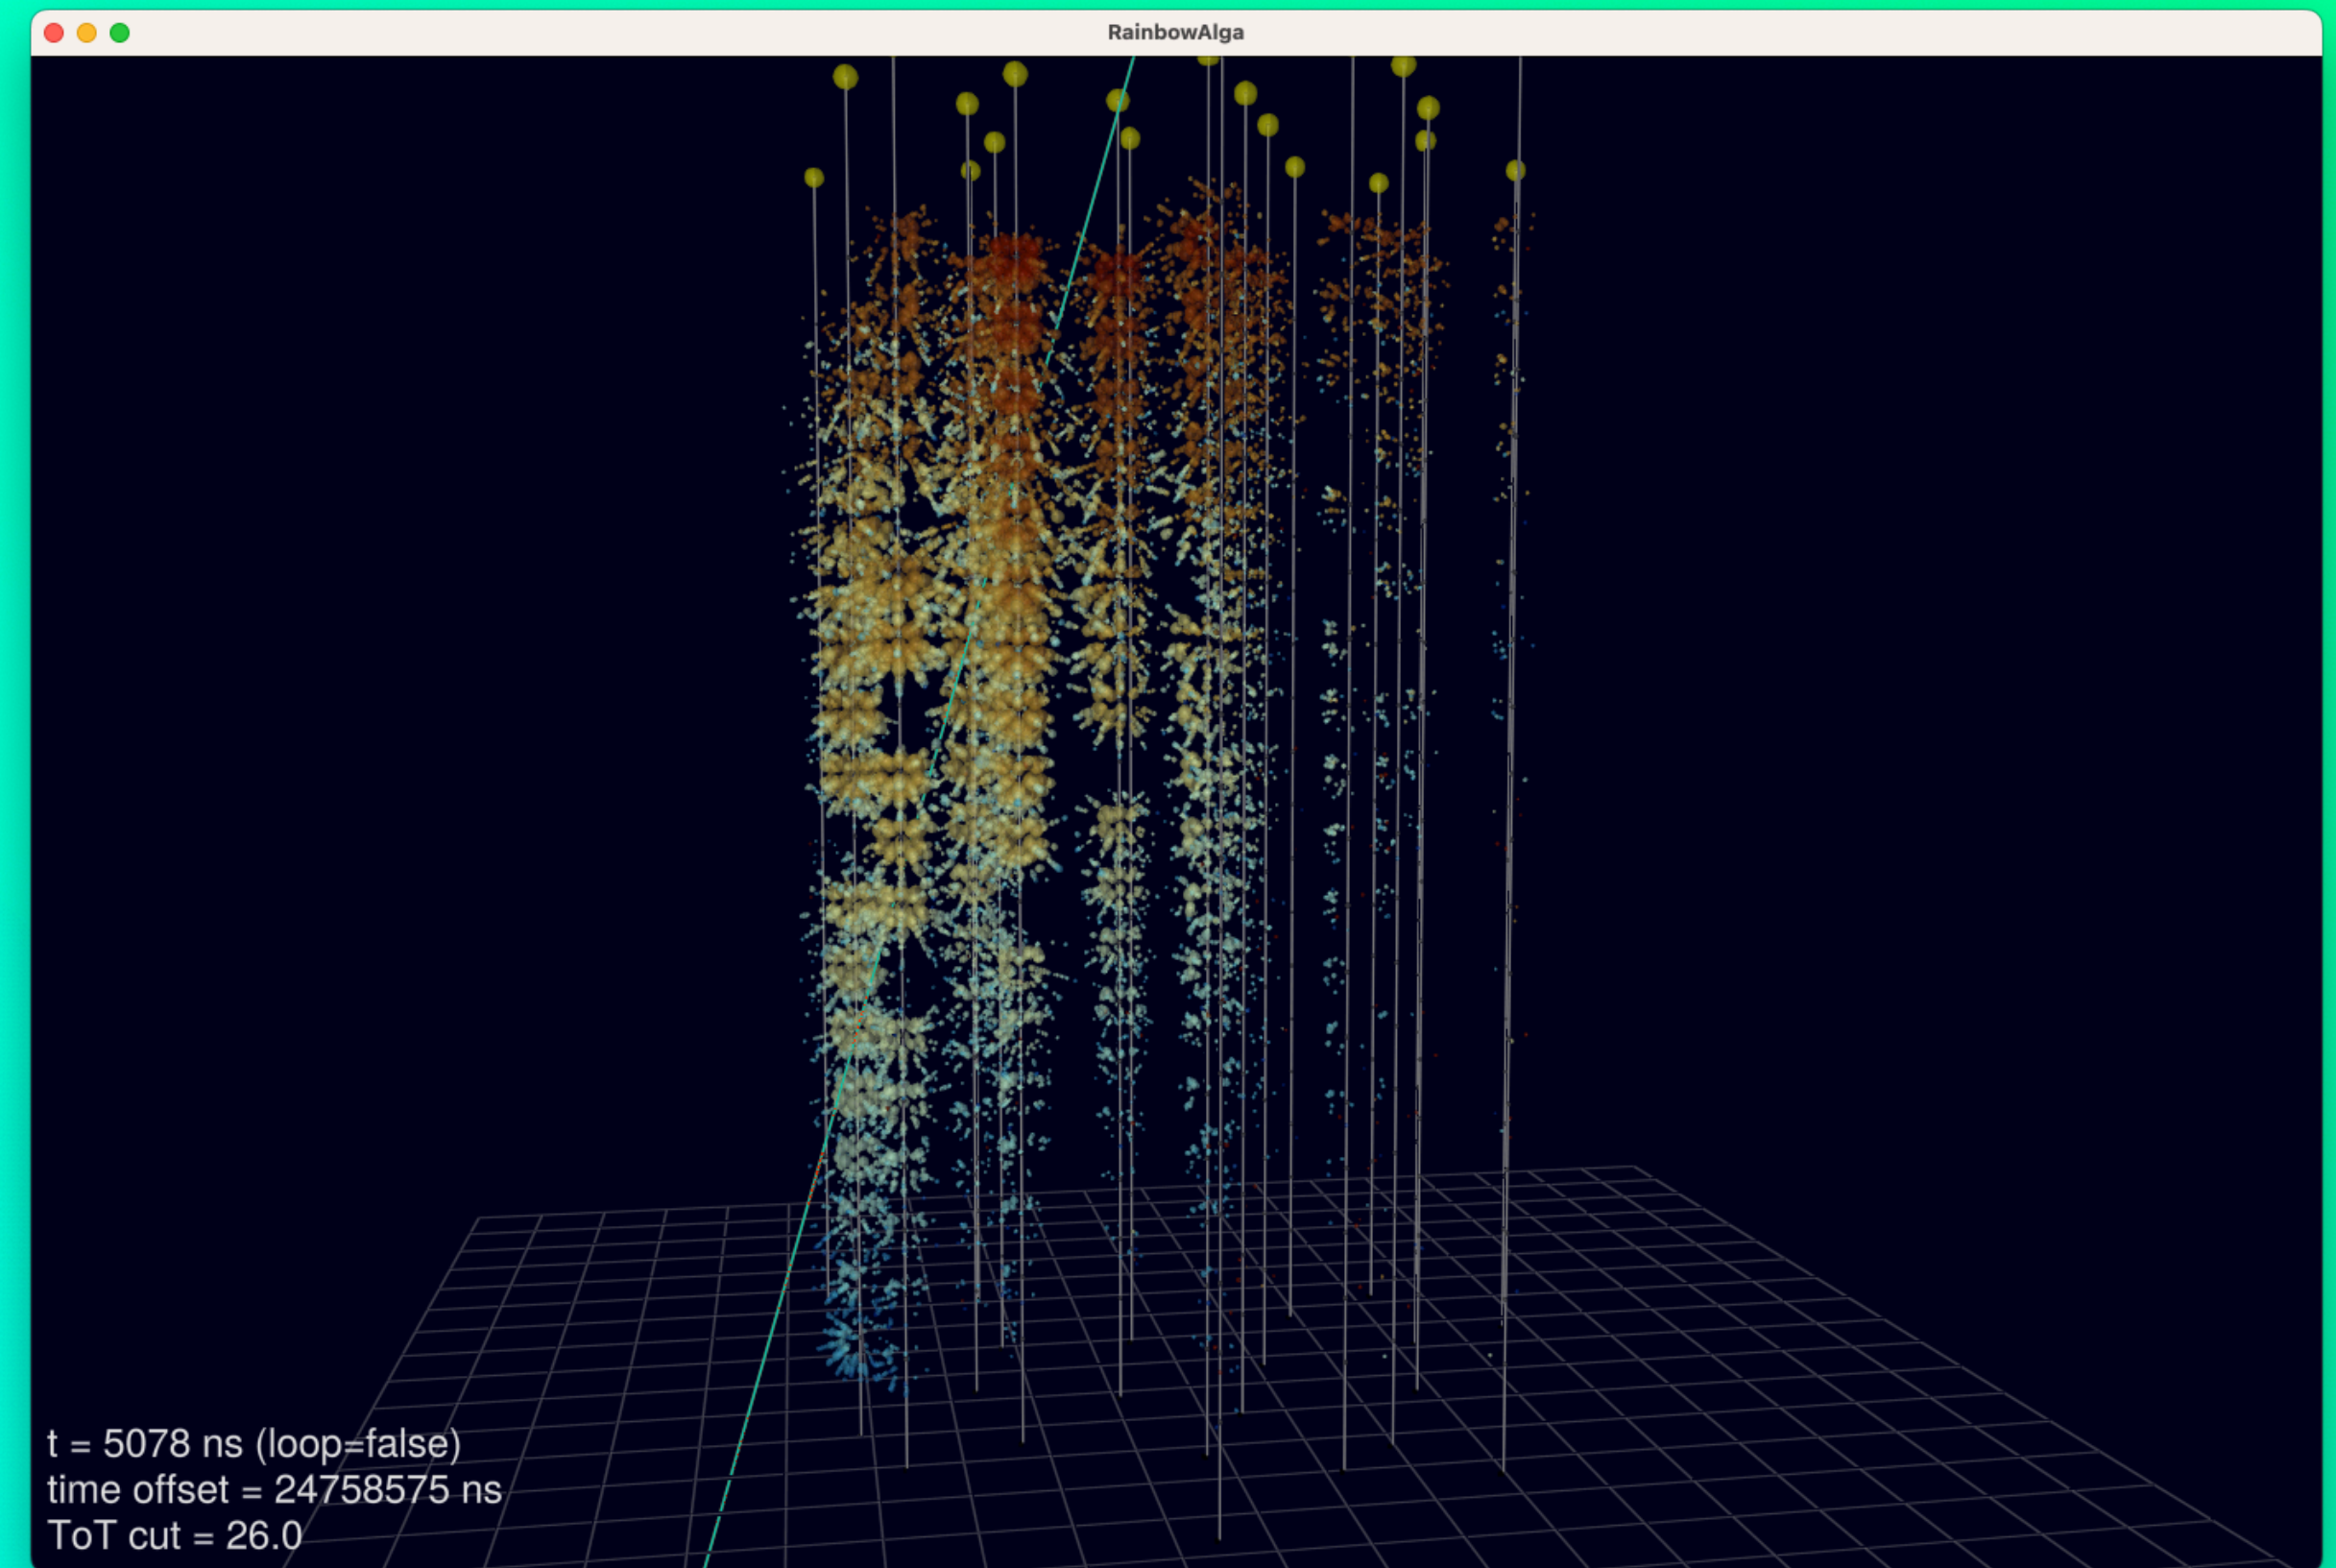

# RainbowAlga.jl

- Animations use a **global clock** (time in nanoseconds) and FPS is limited manually
- **Current implementation** of the main loop is **managing GLFW manually** (buffer swapping, event polling, rendering etc.)
- As **Simon Danisch** pointed out: **GLMakie.jl is capable** of doing it more efficiently using the **render\_tick** method
  - I still have some issues making it work correctly
  - Main problems: performance and REPL interactivity
  - Work in progress...
- **Exporting screenshots (and videos) of the scene is not working correctly**
  - The images have wrong depth information and a very low resolution with messed-up colouring
  - Simon helped to debug but we could not figure out what's happening
  - Luckily, one can easily take screenshots using built-in OS functionalities

*demo*

# Very High Energy Event detected with KM3NeT/ARCA

- **Significant event observed with huge amount of light**
- Horizontal event (**1° above horizon**) as expected since earth opaque to neutrinos at PeV scale
- **3672 PMTs (35%)** were triggered in the detector
- Muons simulated at 10 PeV almost never generate this much light
- **Likely multiple 10's of PeV**

First figure in the upcoming Nature paper is made with RainbowAlga.jl ; )

# Thanks!

"People are very open-minded about new things —  
as long as they're exactly like the old ones." -  
*Charles F. Kettering*
