## BRANCHING, ITERATION

#### Yasser M. Abdou Physics Department, Faculty of Science, Tanta University

6.0001 LECTURE 2

### TODAY

- string object type
- branching and conditionals
- indentation
- iteration and loops

### STRINGS

- Ietters, special characters, spaces, digits
- enclose in quotation marks or single quotes
  hi = "hello there"
- concatenate strings

name = "ana"

greet = hi + name

greeting = hi + " " + name

• do some operations on a string as defined in Python docs silly = hi + " " + name \* 3

### INPUT/OUTPUT: print

- used to output stuff to console
- keyword is print

x = 1

print(x)

x str = str(x)

print("my fav num is", x, ".", "x =", x)

print("my fav num is " + x\_str + ". " + "x = " + x\_str)

### INPUT/OUTPUT: input ("")

- prints whatever is in the quotes
- user types in something and hits enter
- binds that value to a variable

```
text = input("Type anything... ")
print(5*text)
```

Input gives you a string so must cast if working with numbers

```
num = int(input("Type a number... "))
```

```
print(5*num)
```

# COMPARISON OPERATORS ON int, float, string

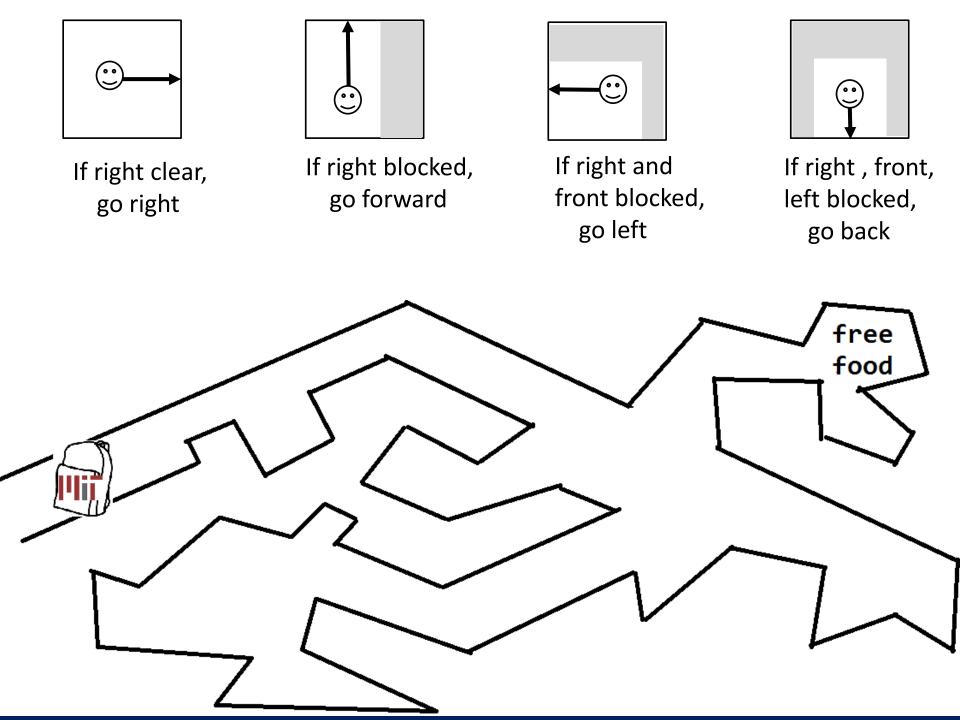

- i and j are variable names
- comparisons below evaluate to a Boolean
- i > j
- i >= j
- i < j
- i <= j
- i == j → equality test, True if i is the same as j
- i != j → inequality test, True if i not the same as j

### LOGIC OPERATORS ON bools

- a and b are variable names (with Boolean values)
- not a → True if a is False
  False if a is True
- a and b → True if both are True
- a or b → True if either or both are True

Α	В	A and B	A or B
True	True	True	True
True	False	False	True
False	True	False	True
False	False	False	False

```
COMPARISON EXAMPLE
pset time = 15
sleep time = 8
print(sleep time > pset time)
derive = True
drink = False
both = drink and derive
print(both)
```

### CONTROL FLOW - BRANCHING

if <condition>: <expression> <expression> </expression></expression></condition>	if <condition>: <expression> <expression>  elif <condition>:</condition></expression></expression></condition>
<pre>if <condition>:         <expression>         <expression>  else:         <expression></expression></expression></expression></condition></pre>	<pre>elli <condition>.         <expression></expression></condition></pre>
<expression></expression>	

- <condition> has a value True or False
- evaluate expressions in that block if <condition> is True

### INDENTATION

- matters in Python
- how you denote blocks of code

```
x = float(input("Enter a number for x: "))
```

```
y = float(input("Enter a number for y: "))
```

```
if x == y:
```

```
print("x and y are equal")
```

```
if y != 0:
```

```
print("therefore, x / y is", x/y)
```

```
elif x < y:
```

```
print("x is smaller")
```

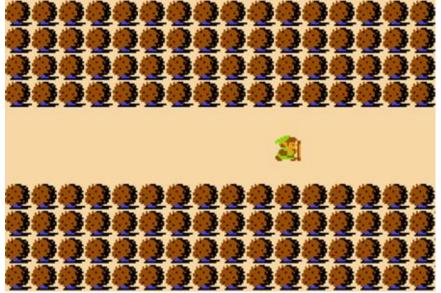

else:

```
print("y is smaller")
```

```
print("thanks!")
```

#### = VS ==

```
x = float(input("Enter a number for x: "))
  = float(input("Enter a number for y: "))
                                              What if x = V here?
Bet a SyntaxError
if x == y:
    print("x and y are equal")
    if y != 0:
         print("therefore, x / y is", x/y)
elif x < y:
    print("x is smaller")
else:
    print("y is smaller")
print("thanks!")
```

while <exit right>:

<set background to woods background>

<set background to exit\_background>

## CONTROL FLOW: while LOOPS

while <condition>: <expression> <expression>

- <condition> evaluates to a Boolean
- if <condition> is True, do all the steps inside the
  while code block
- check <condition> again
- repeat until < condition> is False

### while LOOP EXAMPLE

You are in the Lost Forest.

\*\*\*\*\*

#### PROGRAM:

n = input("You're in the Lost Forest. Go left or right? ")
while n == "right":

n = input("You're in the Lost Forest. Go left or right? ")
print("You got out of the Lost Forest!")

## CONTROL FLOW: while and for LOOPS

iterate through numbers in a sequence

```
# more complicated with while loop
n = 0
while n < 5:
    print(n)
    n = n+1</pre>
```

```
# shortcut with for loop
for n in range(5):
    print(n)
```

### CONTROL FLOW: for LOOPS

- for <variable> in range(<some\_num>):
   <expression>
   <expression>
  - • •

- each time through the loop, <variable> takes a value
- first time, <variable> starts at the smallest value
- next time, <variable> gets the prev value + 1
- etc.

### range(start,stop,step)

- default values are start = 0 and step = 1 and optional
- loop until value is stop 1

```
mysum = 0
for i in range(7, 10):
    mysum += i
print(mysum)

mysum = 0
for i in range(5, 11, 2):
    mysum += i
print(mysum)
```

### break STATEMENT

- immediately exits whatever loop it is in
- skips remaining expressions in code block
- exits only innermost loop!

```
while <condition_1>:
    while <condition_2>:
        <expression_a>
        break
        <expression_b>
        <expression_c>
```

### break STATEMENT

```
mysum = 0
for i in range(5, 11, 2):
    mysum += i
    if mysum == 5:
        break
        mysum += 1
```

print(mysum)

```
what happens in this program?
```

### for VS while LOOPS

- for loops
- know number of iterations
- can end early via break
- uses a counter
- can rewrite a for loop using a while loop

while loops

- unbounded number of iterations
- can end early via break
- can use a counter but must initialize before loop and increment it inside loop
- may not be able to rewrite a while loop using a for loop

### Thank You
