Fermions and boson interactions and self-interactions

Quantum corrections to masses and couplings

Structure of the proton

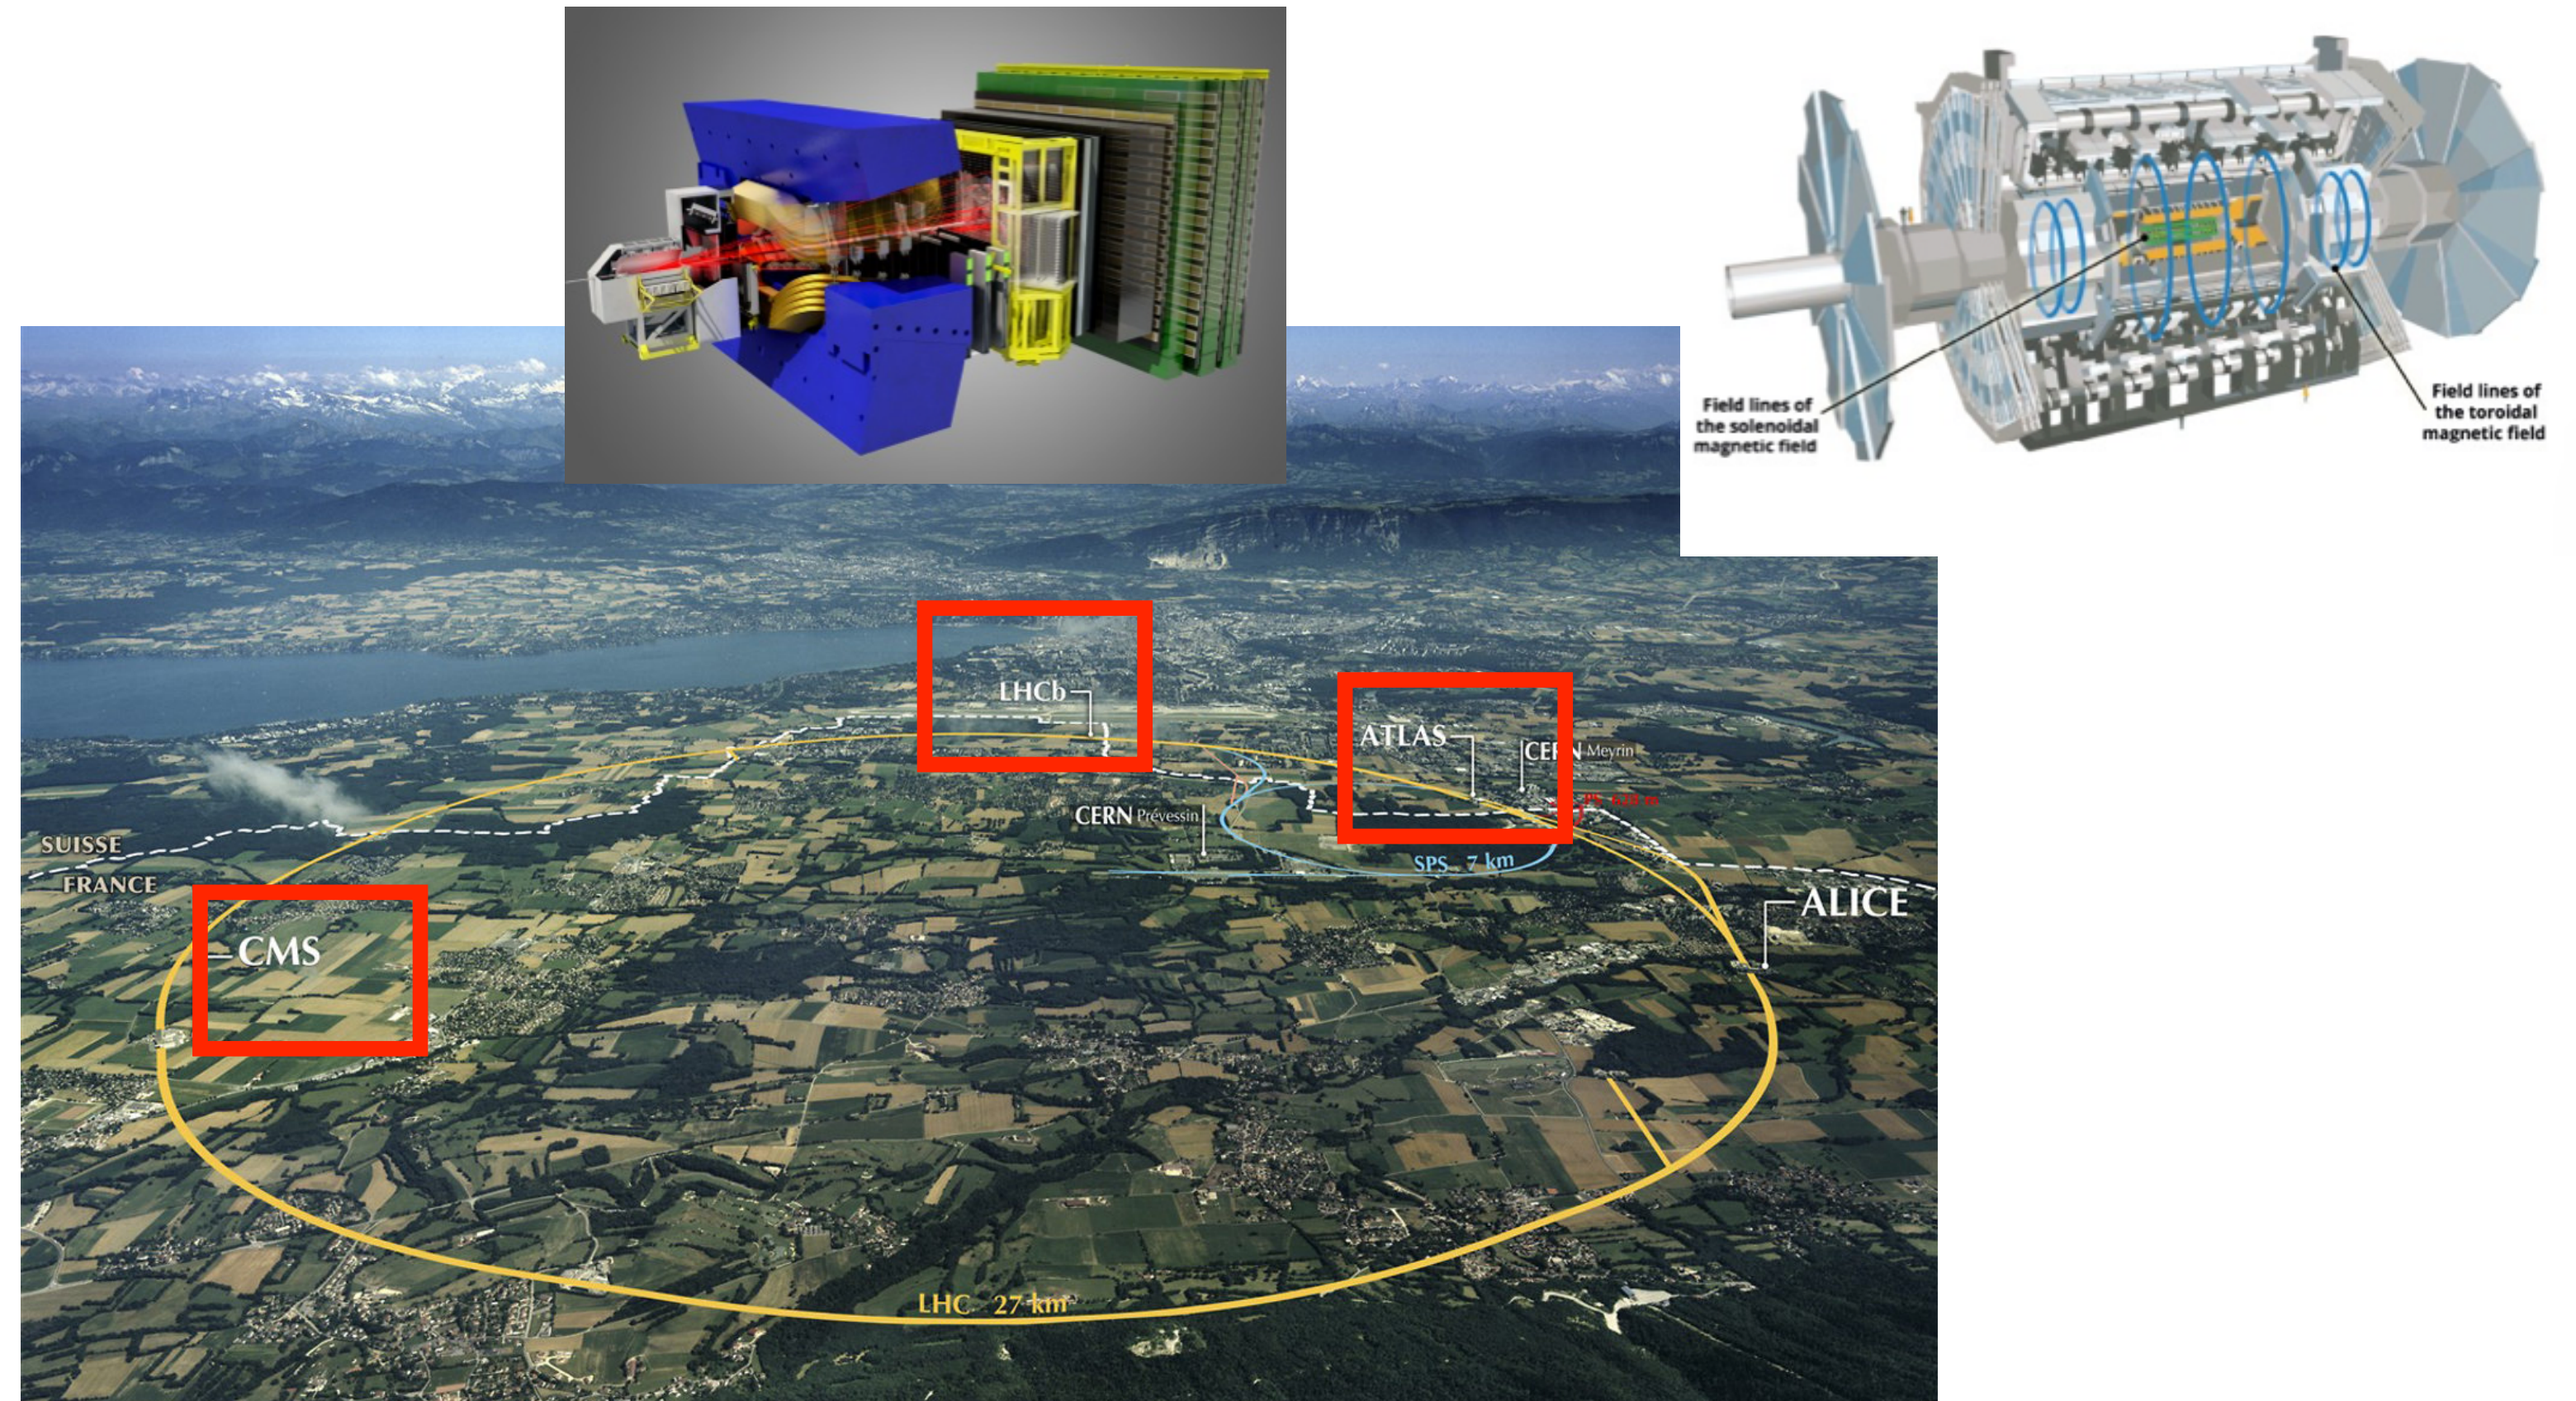

Value of coupling constants, e.g. α_s

From Jan Kretschmar, ICHEP2022

LHC and experiments

13 Years of successful data taking at the LHC covering many energies

[twikiLumiPublicResults](#)

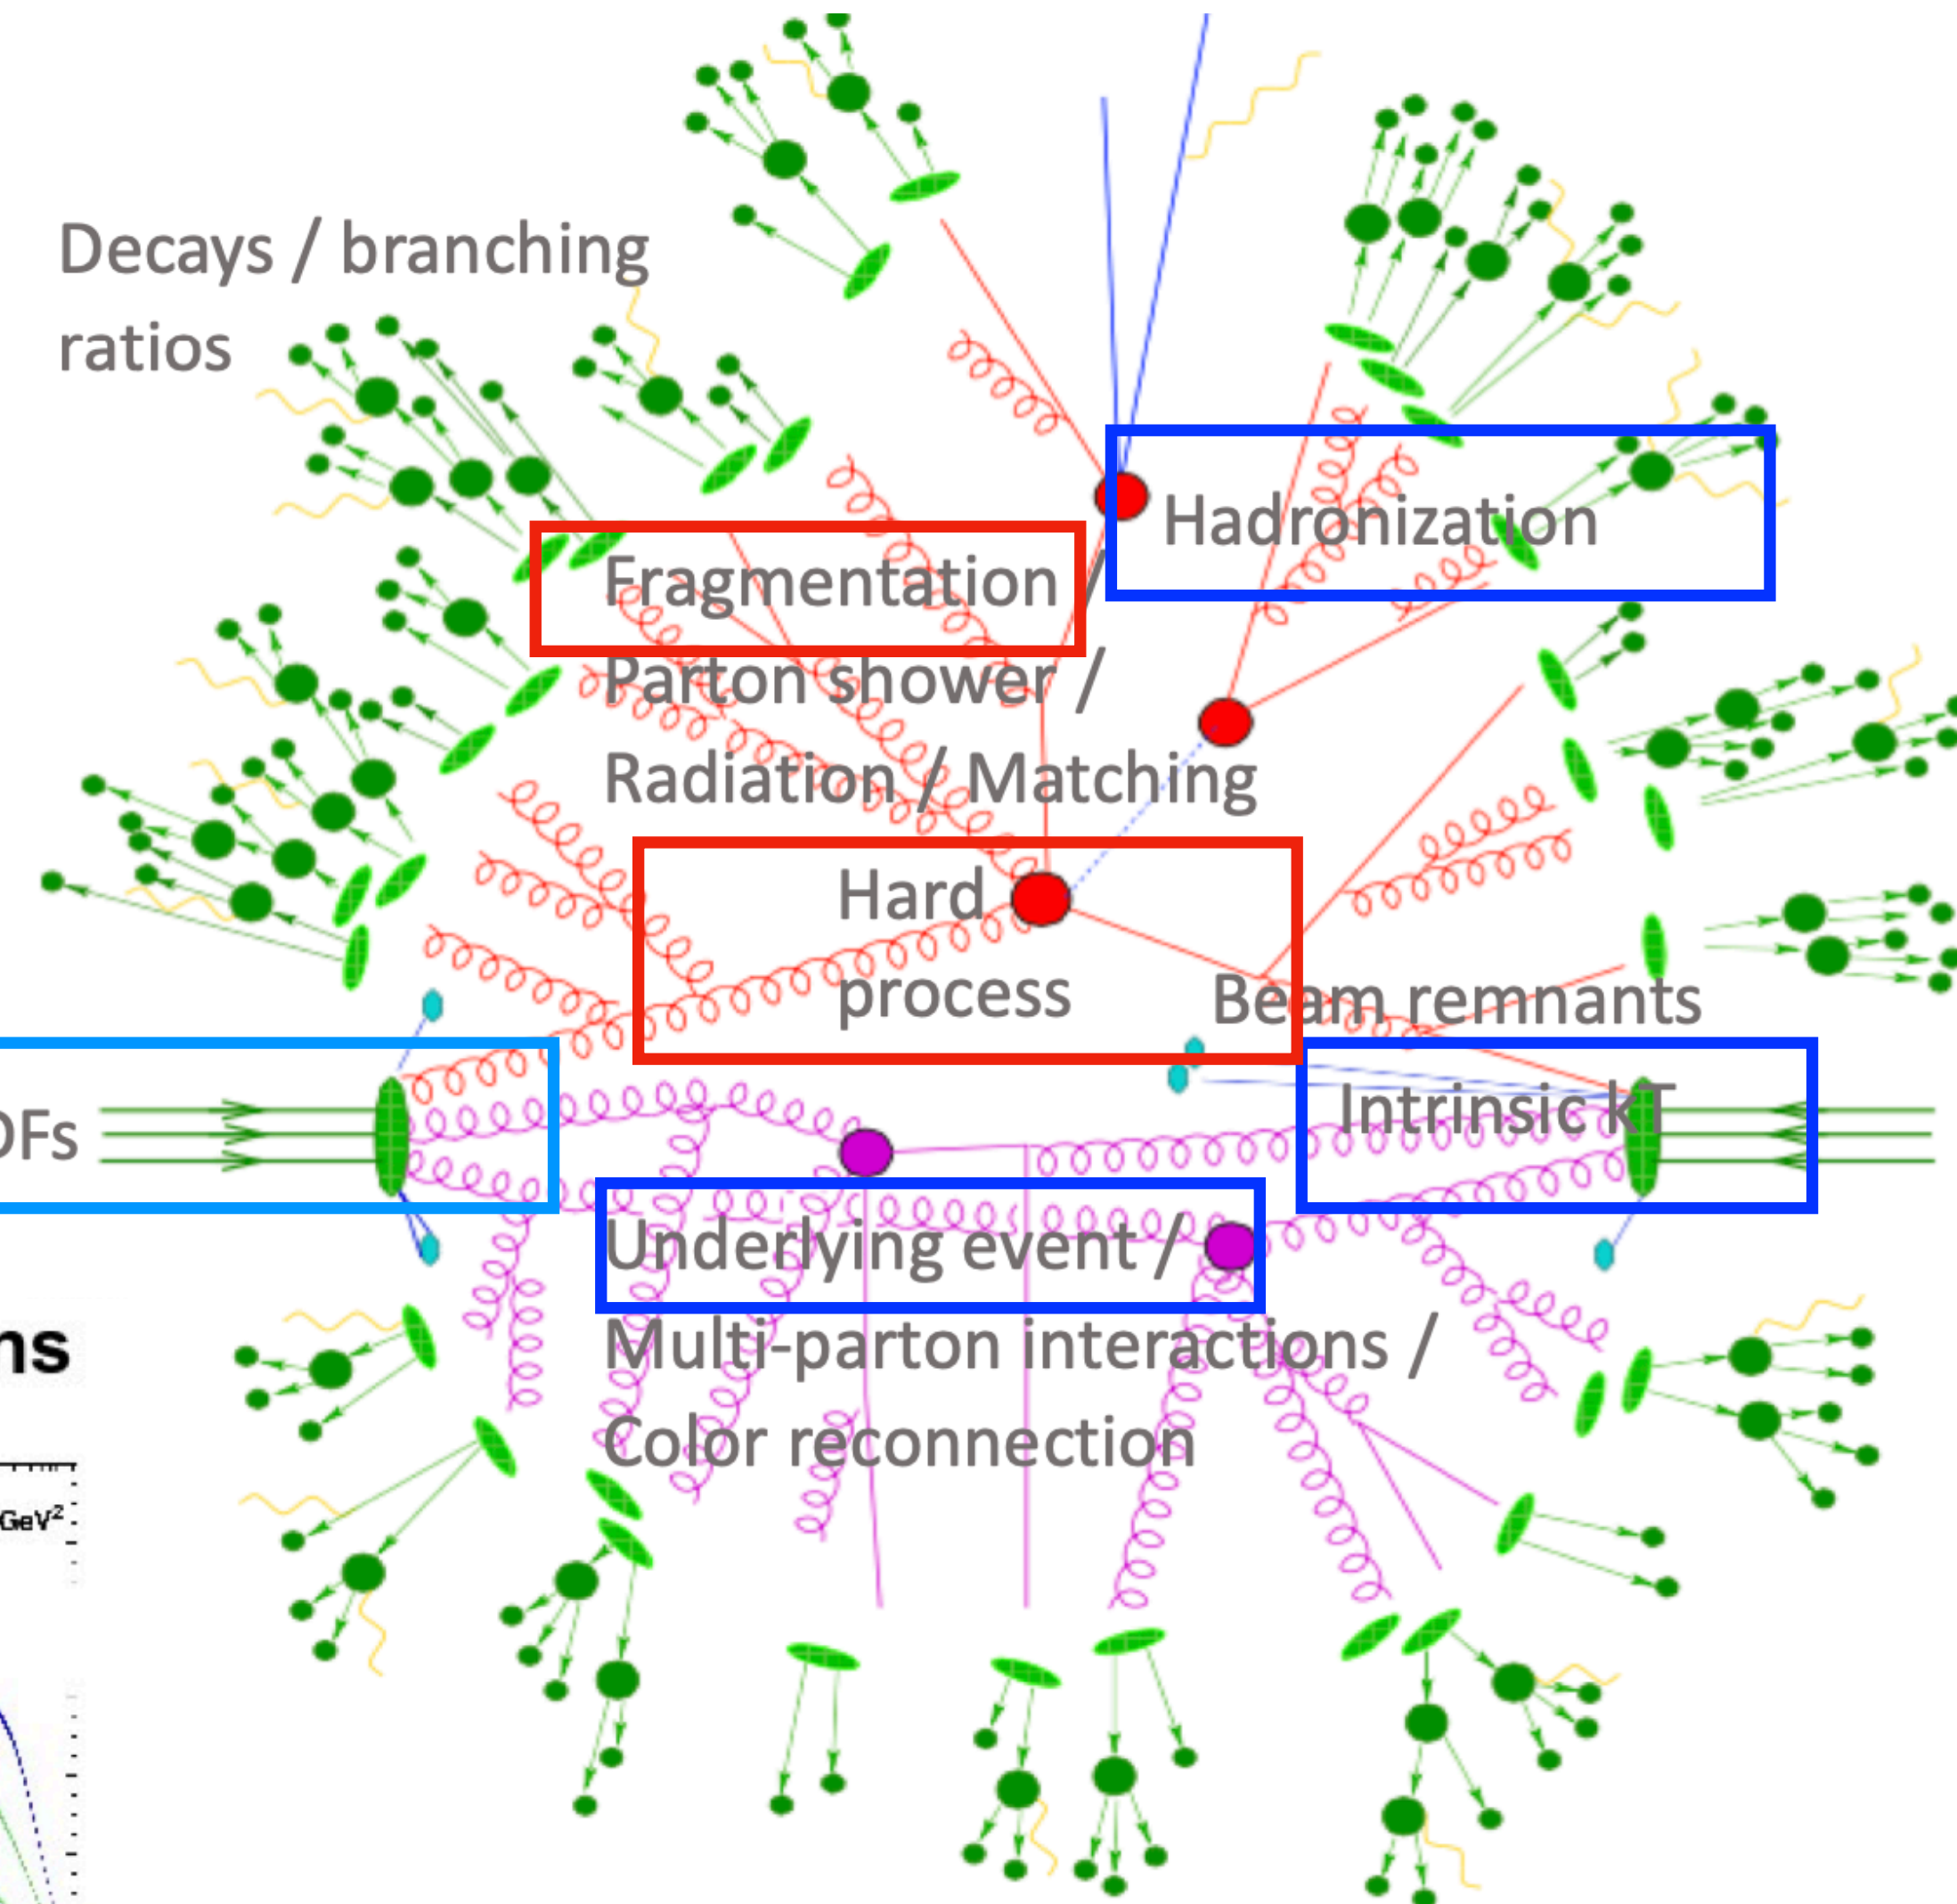

LHC: ring of ~27 km, in Geneva (Switzerland)

EW and QCD

- **EW physics at LHC can't forget about QCD**
- A good QCD model is a prerequisite for EW physics
- Precise EW measurements help to constrain QCD parameters and models

$$\sigma_{pp \rightarrow X} = \sum_{i,j} \int dx_1 dx_2 f_i^p(x_1, \mu) f_j^p(x_2, \mu) \times \sigma_{ij \rightarrow X}$$

Parton Distribution Functions (PDF)
MSTW 2008 NLO PDFs (68% C.L.)

Introduction

Parameters of SM interconnected with each other, e.g.

$$m_W = \left(\frac{\pi \alpha_{EM}}{\sqrt{2} G_F} \right)^{1/2} \frac{\sqrt{1 + \Delta r}}{\sin \theta_W}$$

α_{EM} : fine-structure constant
 θ_W : weak mixing angle
 G_F : Fermi coupling constant

Radiative corrections Δr with largest contributions from m_t^2 , $\log(m_H)$

Precision measurements:

- Test self-consistency of SM theory in global EW fits
- Tensions could be sign of BSM effects
- Probe BSM at energies above those explored by searches

Gfitter, Y. Fischer et al., EPS 2023

Outlook

Today I will focus on selection of most recent results

- **EW sector, focus on electroweak parameter measurements:**

- W boson Mass and Width
- Electroweak mixing angle

*Full publication list here: CMS,
ATLAS, LHCb*

- Taus g-2

- **QCD sector, selection of determinations of $\alpha_S(m_Z)$:**

- ATLAS Z p_T @8TeV
- CMS Inclusive jets @2.76, 7, 8, 13 TeV
- Summary of most recent determinations

ATLAS measurements of the W Boson Mass and Width

Revisit 2011 data for improved measurement of m_W and first measurement of Γ_W at LHC

- Measured from p_T^l and m_T^W distributions in $W \rightarrow l\nu$ decays ($l = e/\mu$)
- Rigorous checks of $p_T(W)$ modelling in dedicated measurements
- Progress in global PDF fits and theoretical calculations

[arxiv2403.15085](https://arxiv.org/abs/2403.15085)

[arXiv2404.06204](https://arxiv.org/abs/2404.06204)

[arXiv0901.0512](https://arxiv.org/abs/0901.0512)

ATLAS results of the W Boson Mass and Width [arxiv2403.15085](https://arxiv.org/abs/2403.15085)

- Separate measurement of mass and width

$$m_W = 80366.5 \pm 15.9 \text{ MeV} \text{ (9.8 stat + 12.5 syst)}$$

$$\Gamma_W = 2202 \pm 47 \text{ MeV} \text{ (32 stat + 34 syst)}$$

- ... as well as simultaneous extraction

- **Most precise single-experiment measurements of Γ_W**

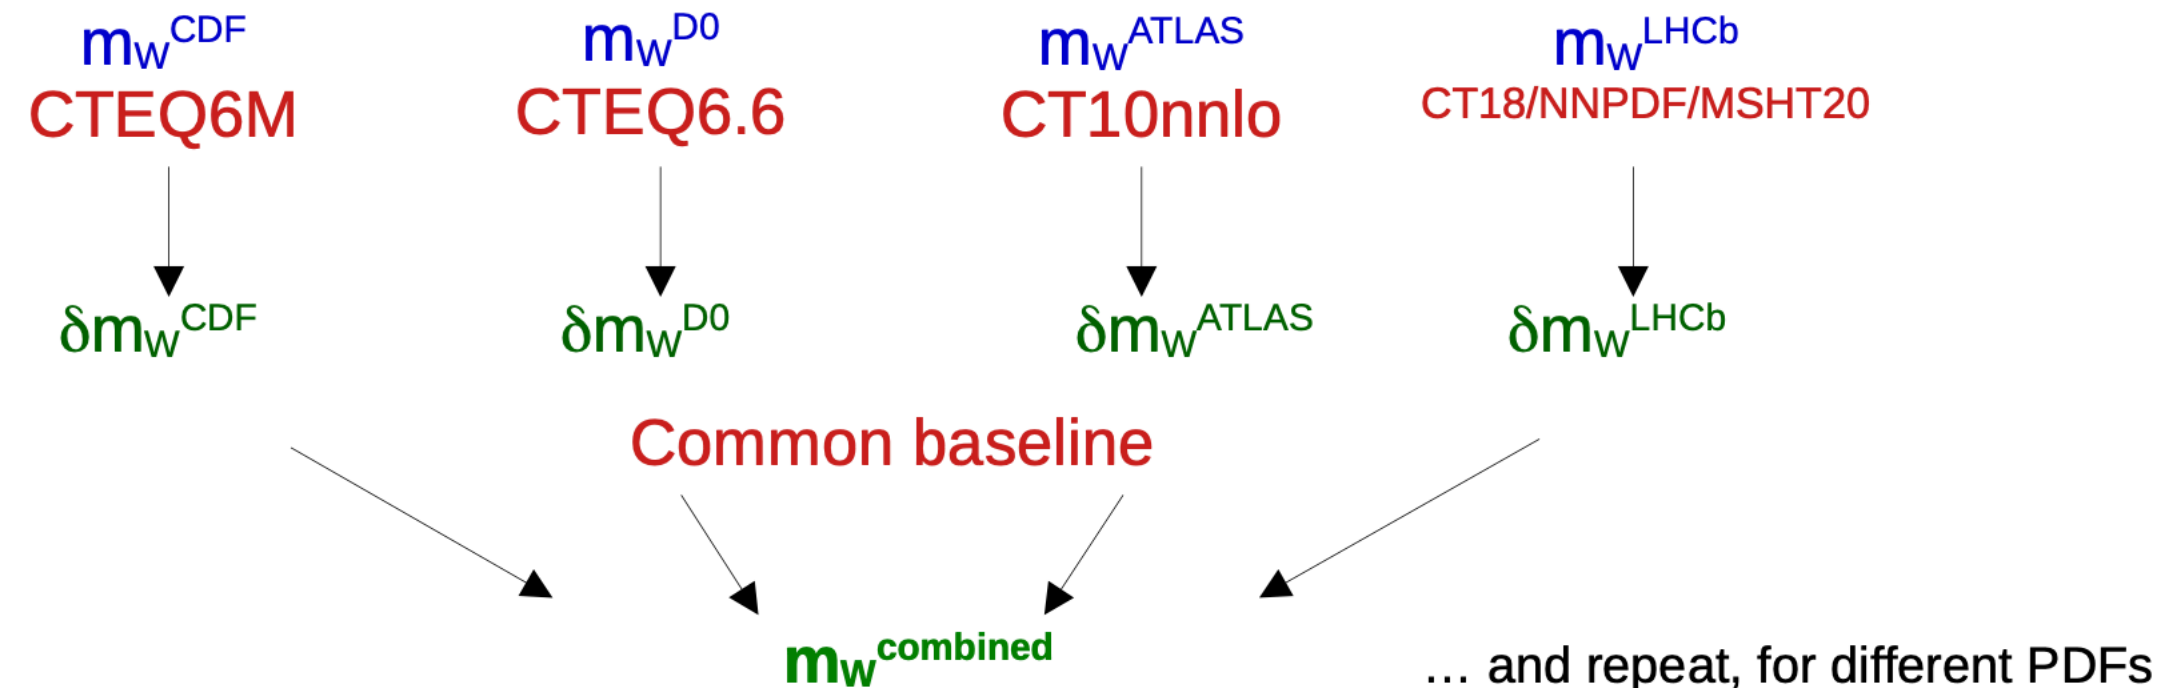

Combination of ATLAS, LHCb, D0 and CDF EPJ C (2024) 84 451

Measurements performed at different times, using different baseline PDFs and QCD tools

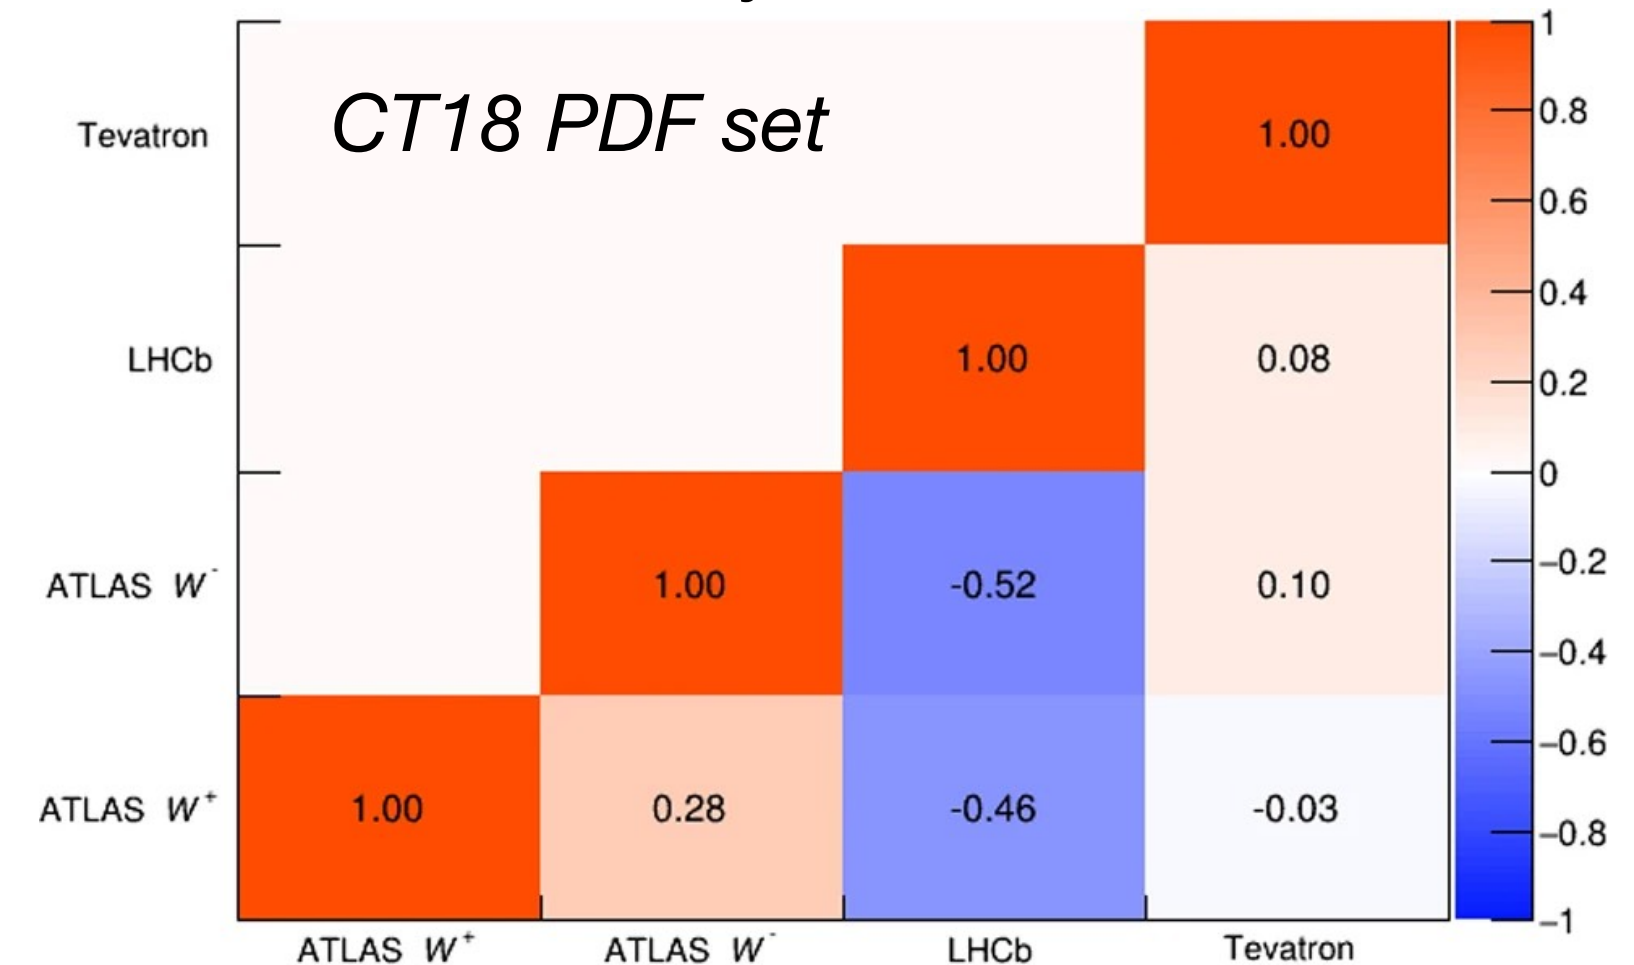

→ **Existing result extrapolated to a common baseline**

- Correct to common theory and modelling
- Combine including correlations (proton structure)

[M. Boonekamp, LHC EW WG](#)
[General Meeting, July 2024](#)

PDF uncertainty correlation matrices

LHCb: m_W determination in forward acceptance suppresses PDF uncertainty in m_W average

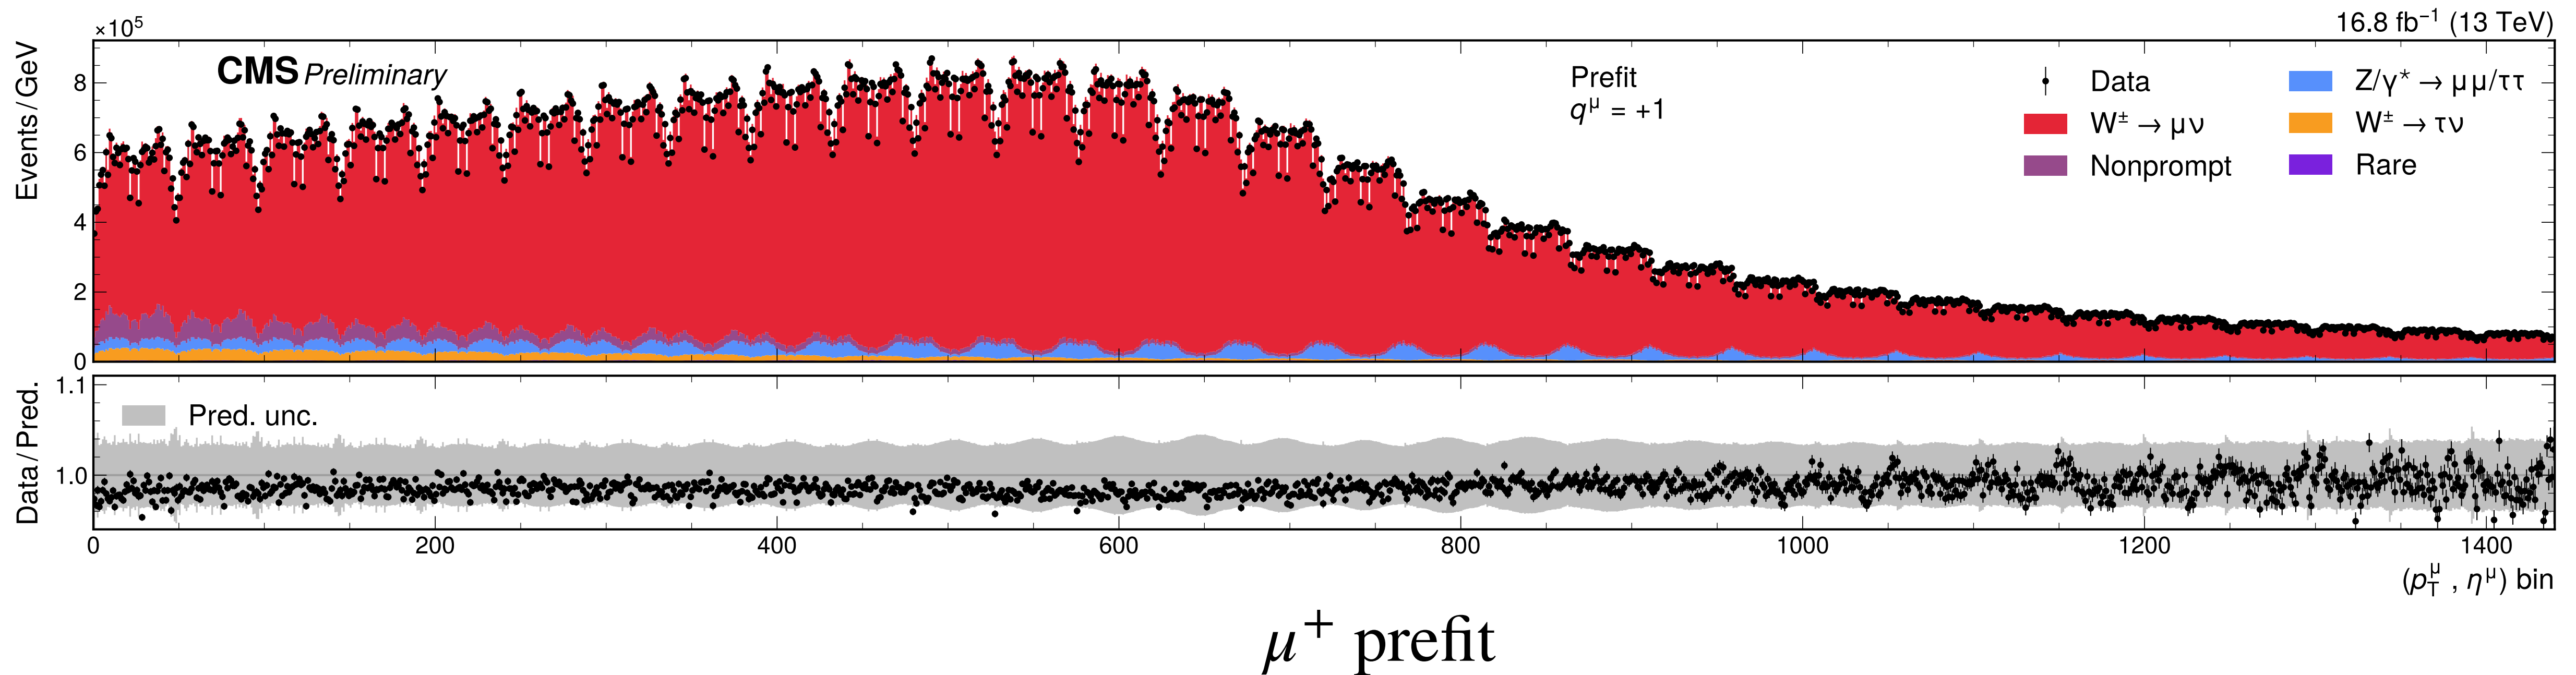

$$m_W = 80364 \pm 32 \text{ MeV} \quad \text{JHEP 01 (2022) 036}$$

ATLAS, LHCb, D0: $m_W = 80369.2 \pm 13.3 \text{ MeV}$

Tension between ATLAS, LHCb, D0 combination and CDF is of 3.6σ

CMS measurement of the W Boson Mass [CMS-PAS-SMP-23-002](#)

- Use **well-understood subset** of 13 TeV data
 - 16.8 fb^{-1} from later part of 2016 run
- p_T^μ **distribution in bins of η_μ** , separately for positive and negative muons
- Requires extremely good calibration of p_T^μ and understanding of p_T^W
- m_W extracted from profile likelihood fit to μ (η , p_T , charge)

CMS results of the W Boson Mass [CMS-PAS-SMP-23-002](#)

This Work

- First m_W measurement from CMS
- Performed with $\sim 10\%$ of Run2 data
- Advances in experimental and theoretical techniques enable improved precision and lay the basis for future measurements

→ **Most precise measurement from LHC $m_W = 80360.2 \pm 9.9$ MeV, in agreement with SM**

↓
 2.4 (stat) \pm 9.6 (syst)

The electroweak mixing angle

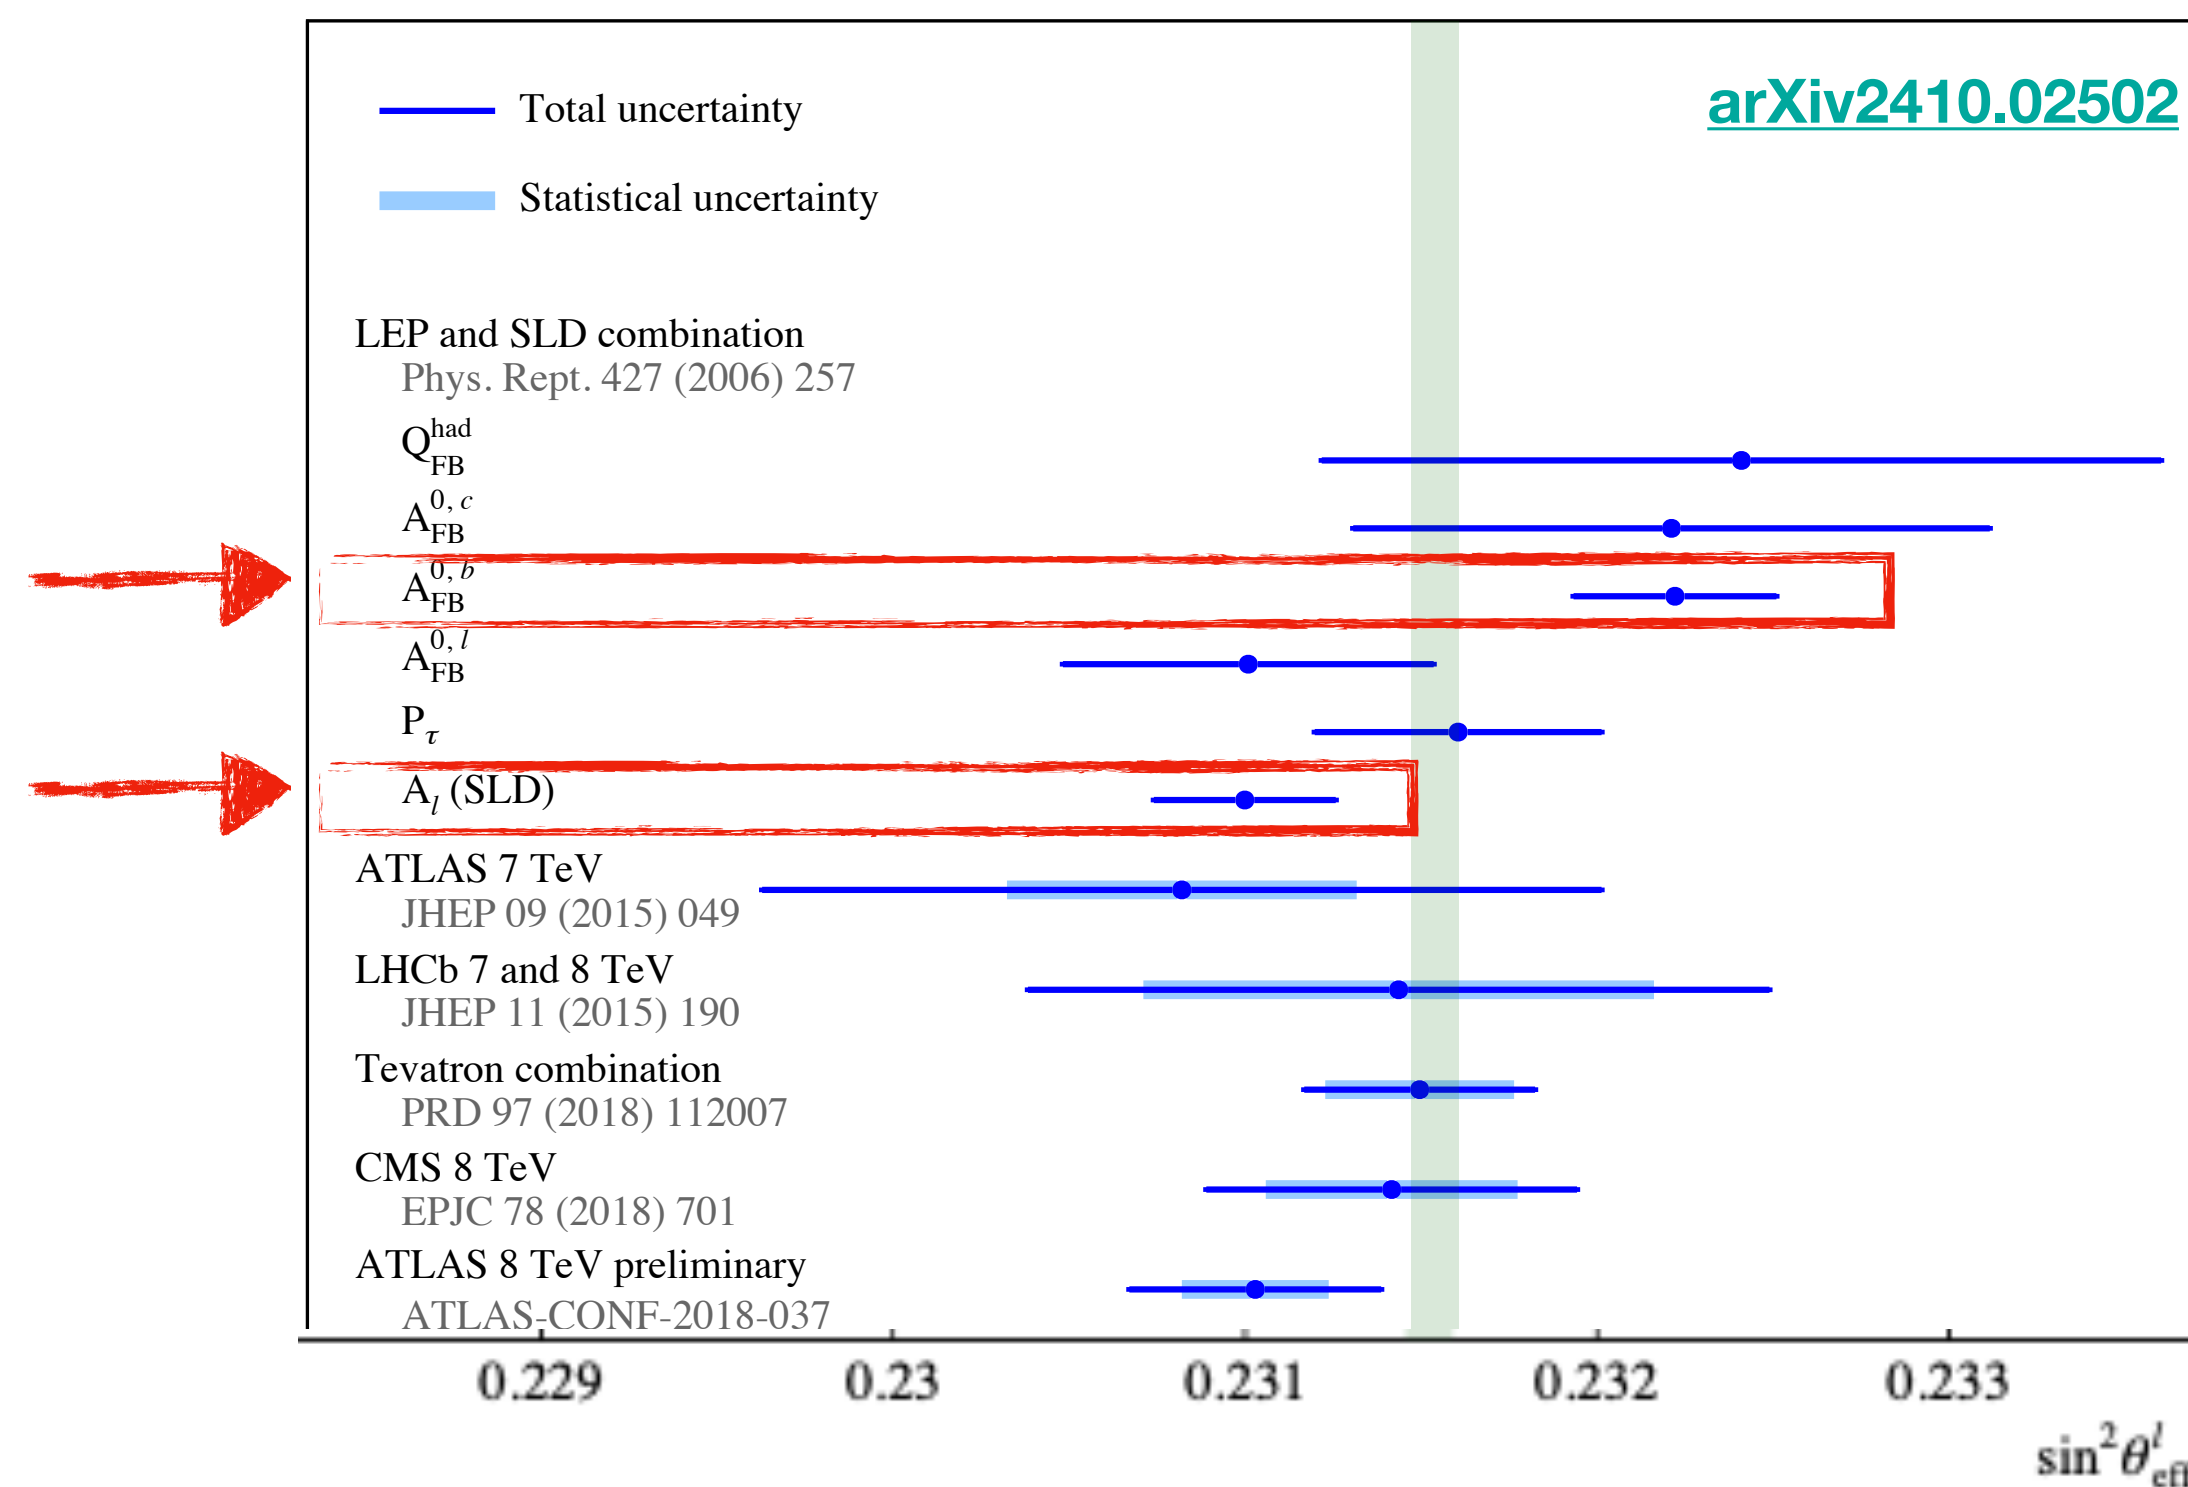

- At the heart of the Standard Model $\sin^2\theta_W = 1 - m_W^2/m_Z^2$
- At higher order: $\sin^2\theta_{eff}^l = k_f \cdot \sin^2\theta_w$ (k_f flavour-dependent effective scaling factor absorbing higher order corr)
- At the LHC the effective mixing angle (leptonic) is measured with DY events in the Collin-Soper frame

$$\frac{d\sigma}{d\cos\theta} \sim 1 + \cos^2\theta + \frac{1}{2}A_0(1 - 3\cos^2\theta) + A_4\cos\theta$$

$$A_{FB} = 3A_4/8 \rightarrow \sin^2\theta_{eff}^l$$

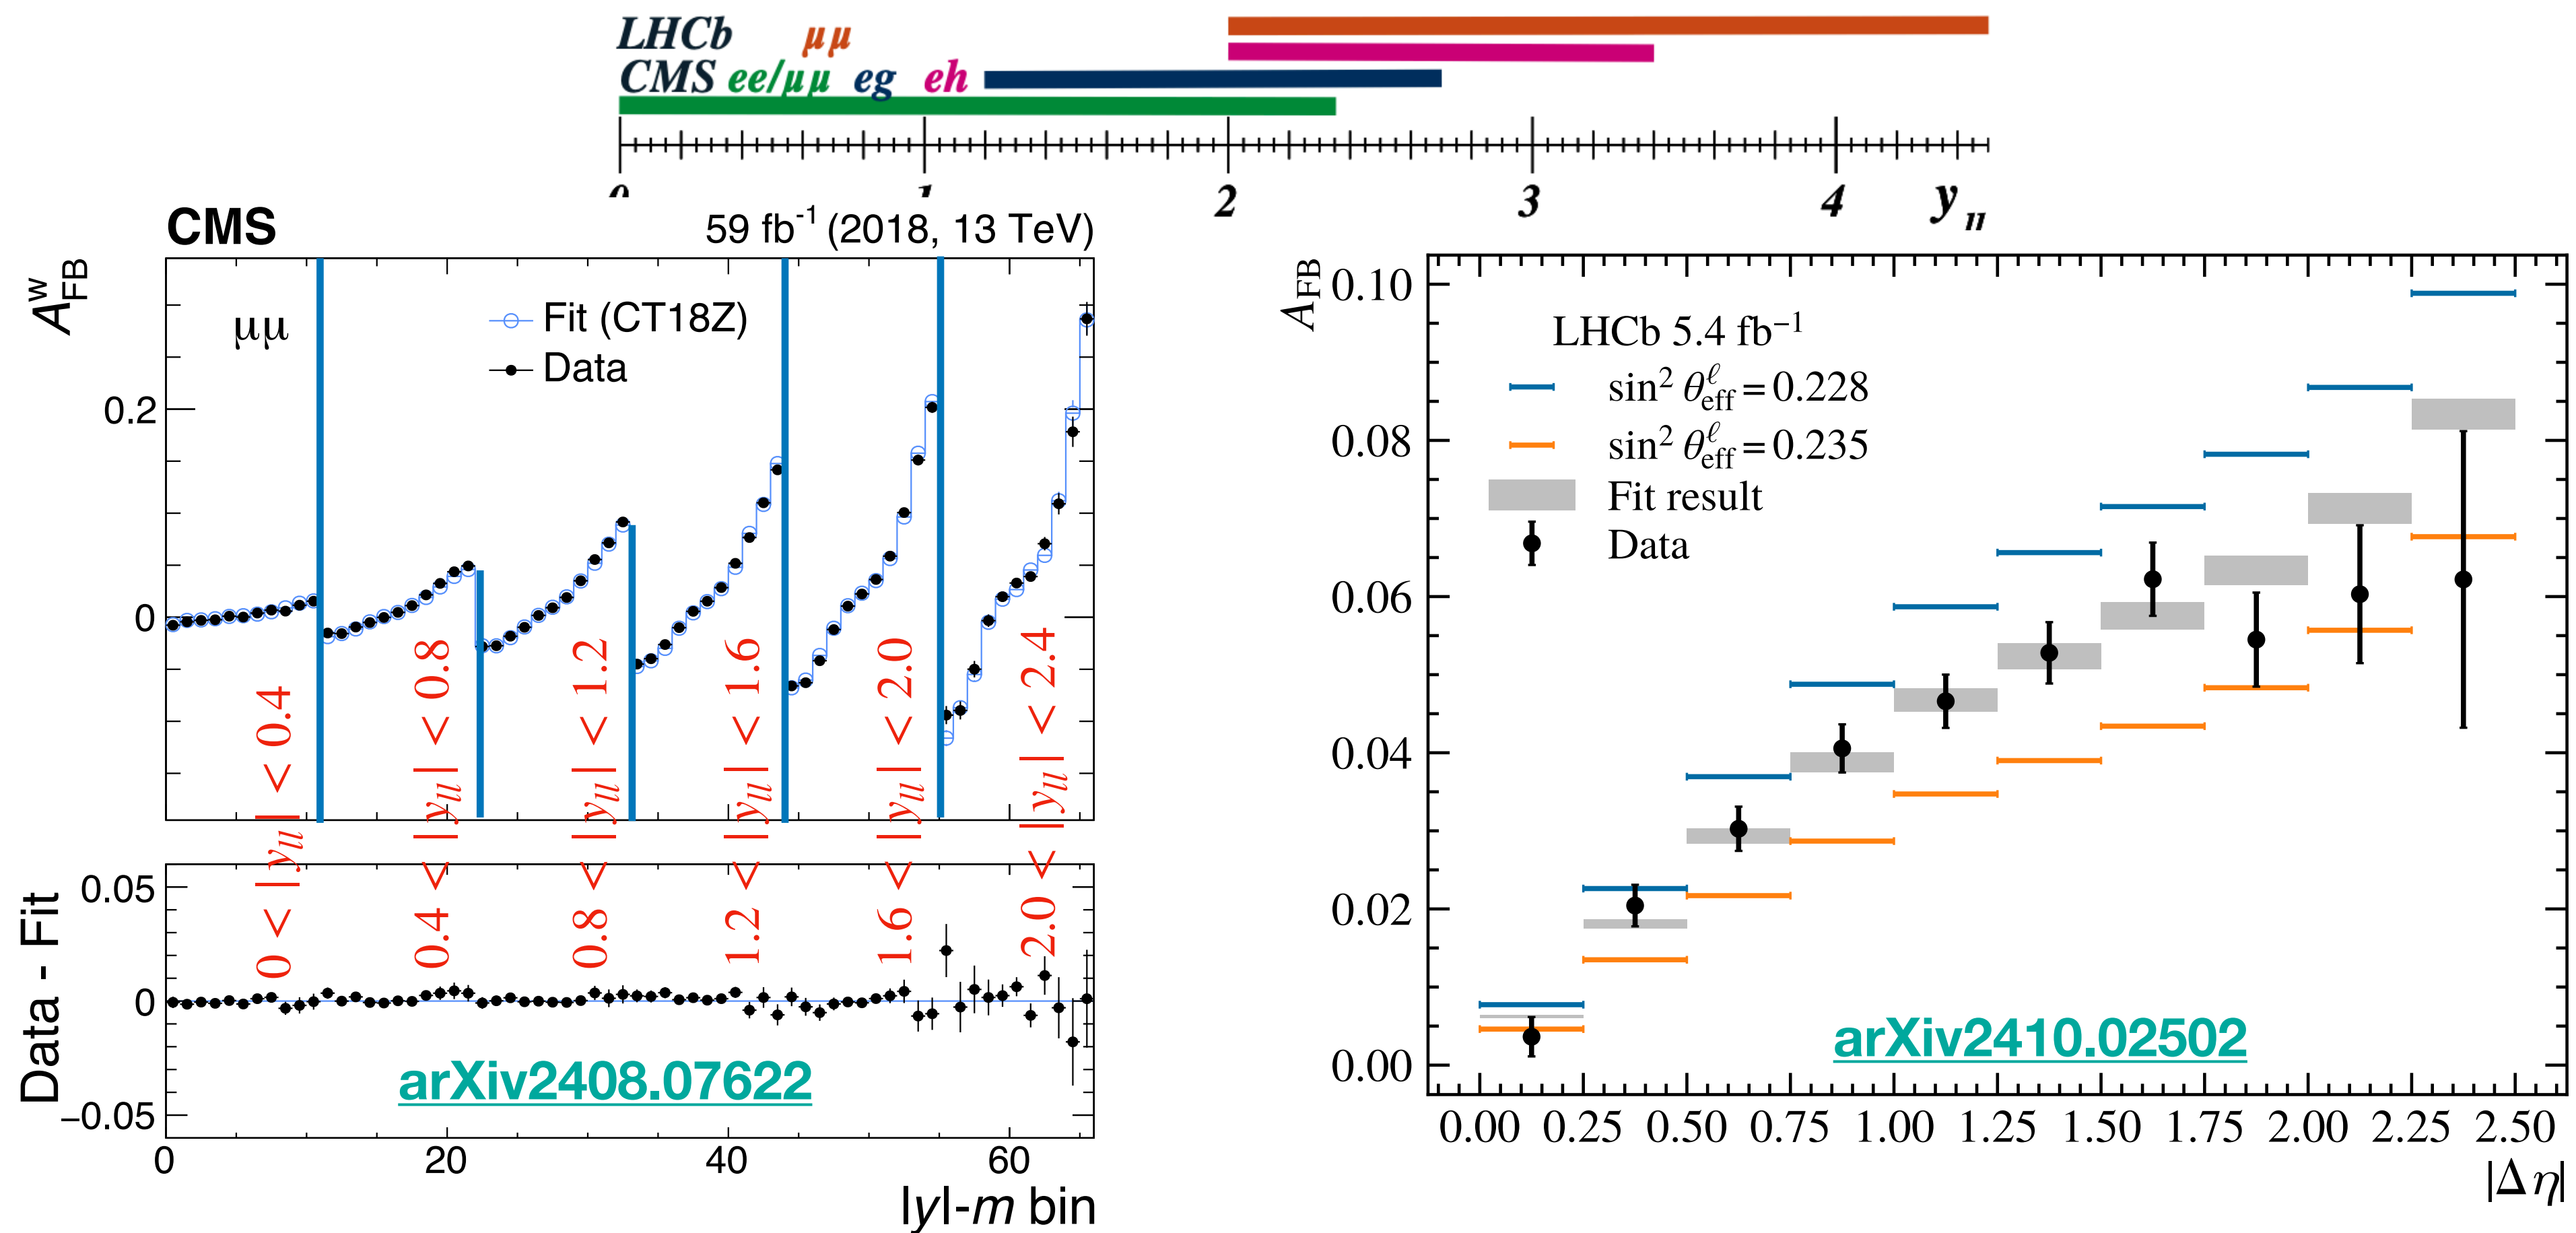

Two most precise exp. results from LEP/SLD differ by $\sim 3\sigma$

CMS and LHCb measurements of the effective weak mixing angle

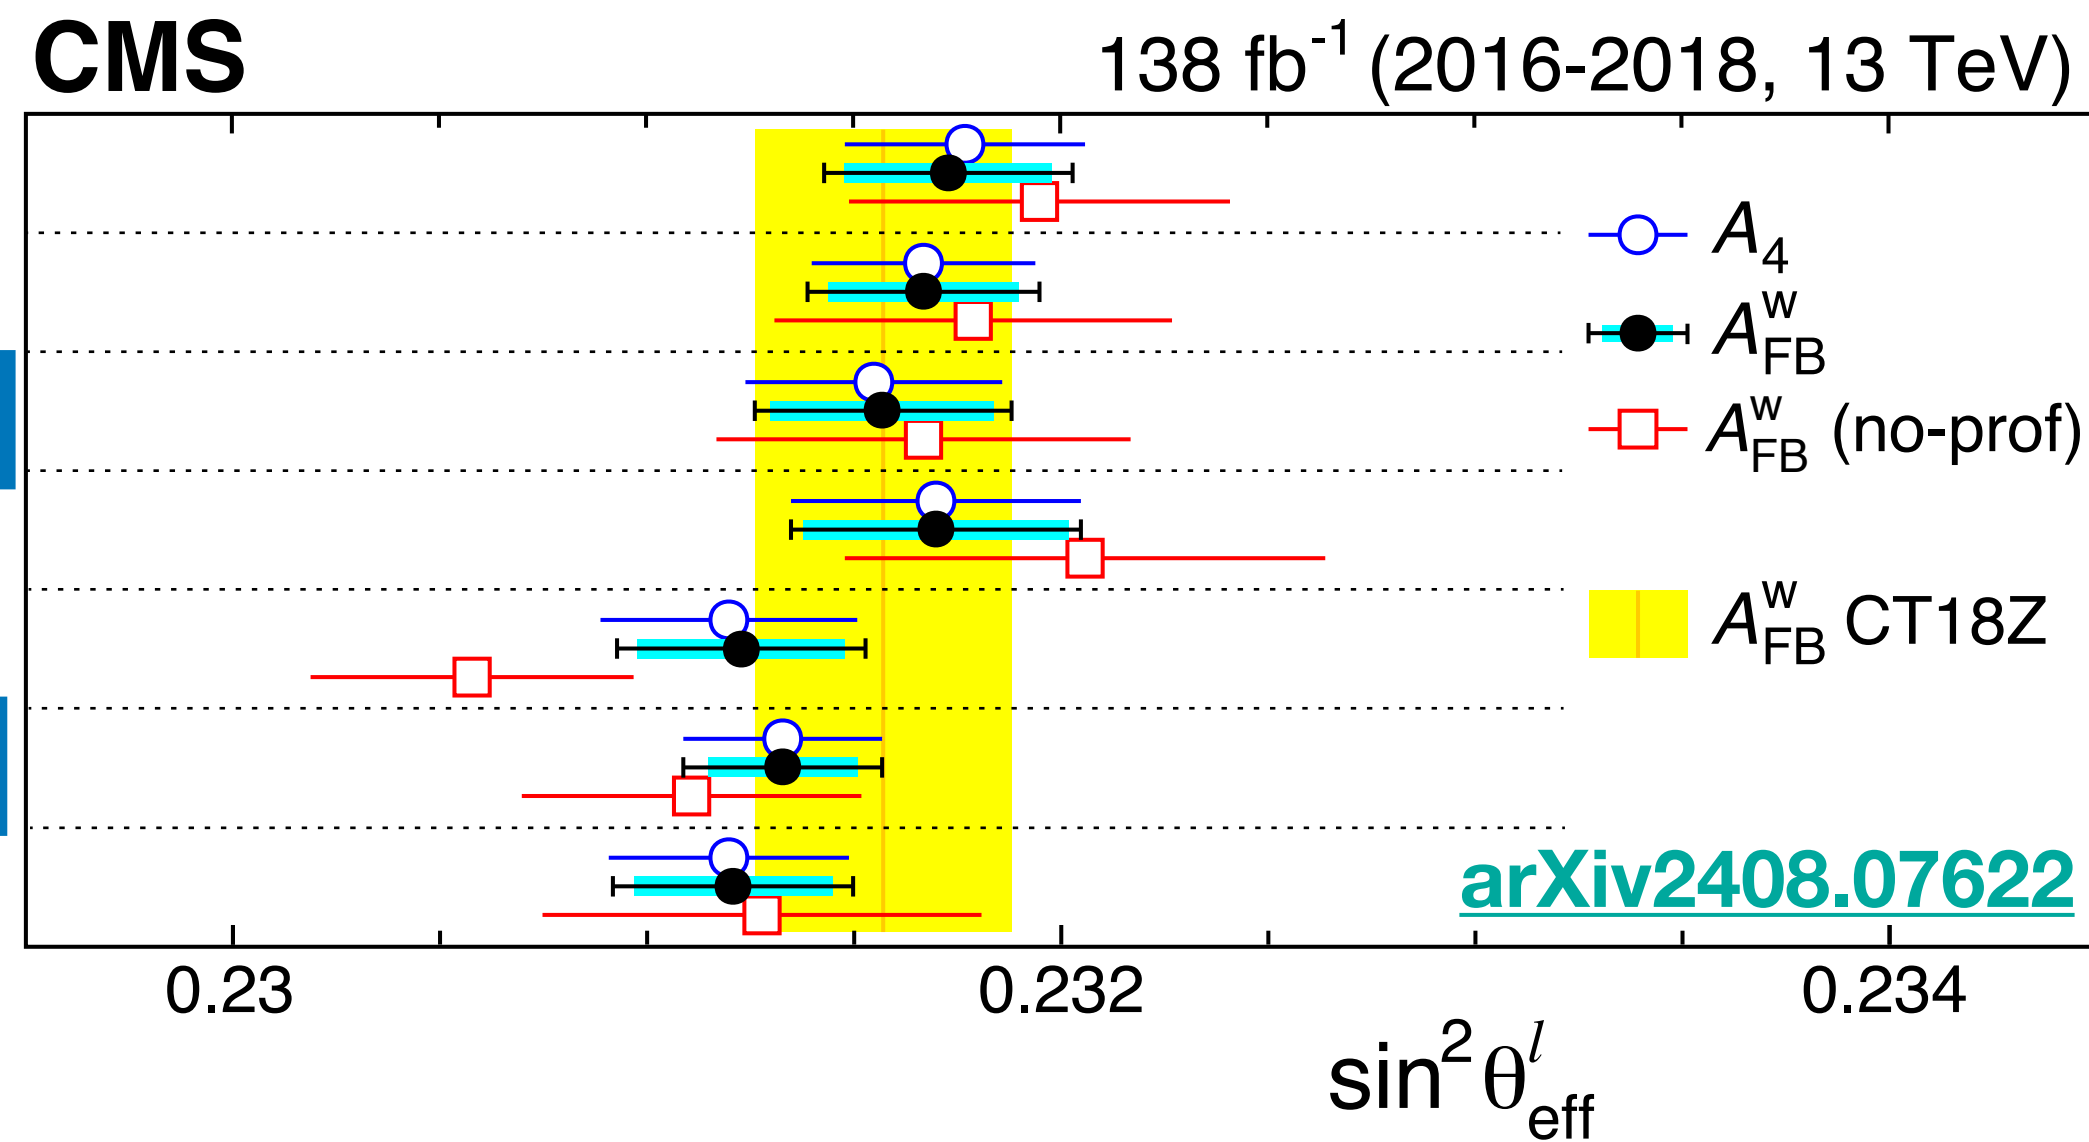

- Ambiguity in quark direction resolved through rapidity-dependent measurement
- Reconstruction of muons in CMS up to $|\eta| < 2.4$ and electrons extended to $|\eta| < 4.36$
3 categories for electrons: “e” tracker only, “g” and “h” in forward calorimeters
- High quality muon reconstruction in LHCb in $2 < \eta < 4.5$

CMS and LHCb results of the effective weak mixing angle

- In CMS PDF uncertainties profiled in fit of $\sin^2 \theta_{eff}^l$
- reduced differences between global PDF fits and reduced uncertainties

[arXiv2410.02502](https://arxiv.org/abs/2410.02502)

New, precise measurements from hadron colliders

CMS : $\sin^2 \theta_{eff}^l = 0.23157 \pm 0.00010(\text{stat}) \pm 0.00015(\text{syst}) \pm 0.00009(\text{theo}) \pm 0.00027(\text{PDF})$

LHCb : $\sin^2 \theta_{eff}^l = 0.23147 \pm 0.00044(\text{stat}) \pm 0.00005(\text{syst}) \pm 0.00023(\text{theo/PDF})$

LHCb result dominated by statistics, very promising for Run3

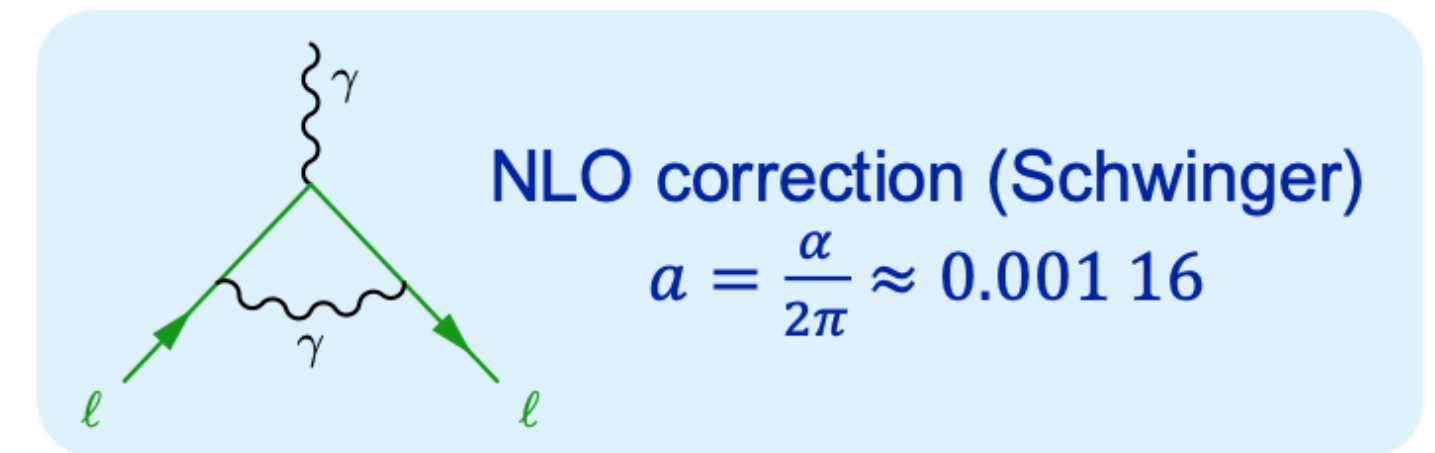

CMS result most precise at hadron colliders

What is g-2?

- Particles with spin (S) have a magnetic moment (μ)
 - For spin-1/2 particles, quantum corrections with a gyromagnetic factor, $g \approx 2.002\ 32$
- anomalous magnetic moment $a = \frac{g - 2}{2}$

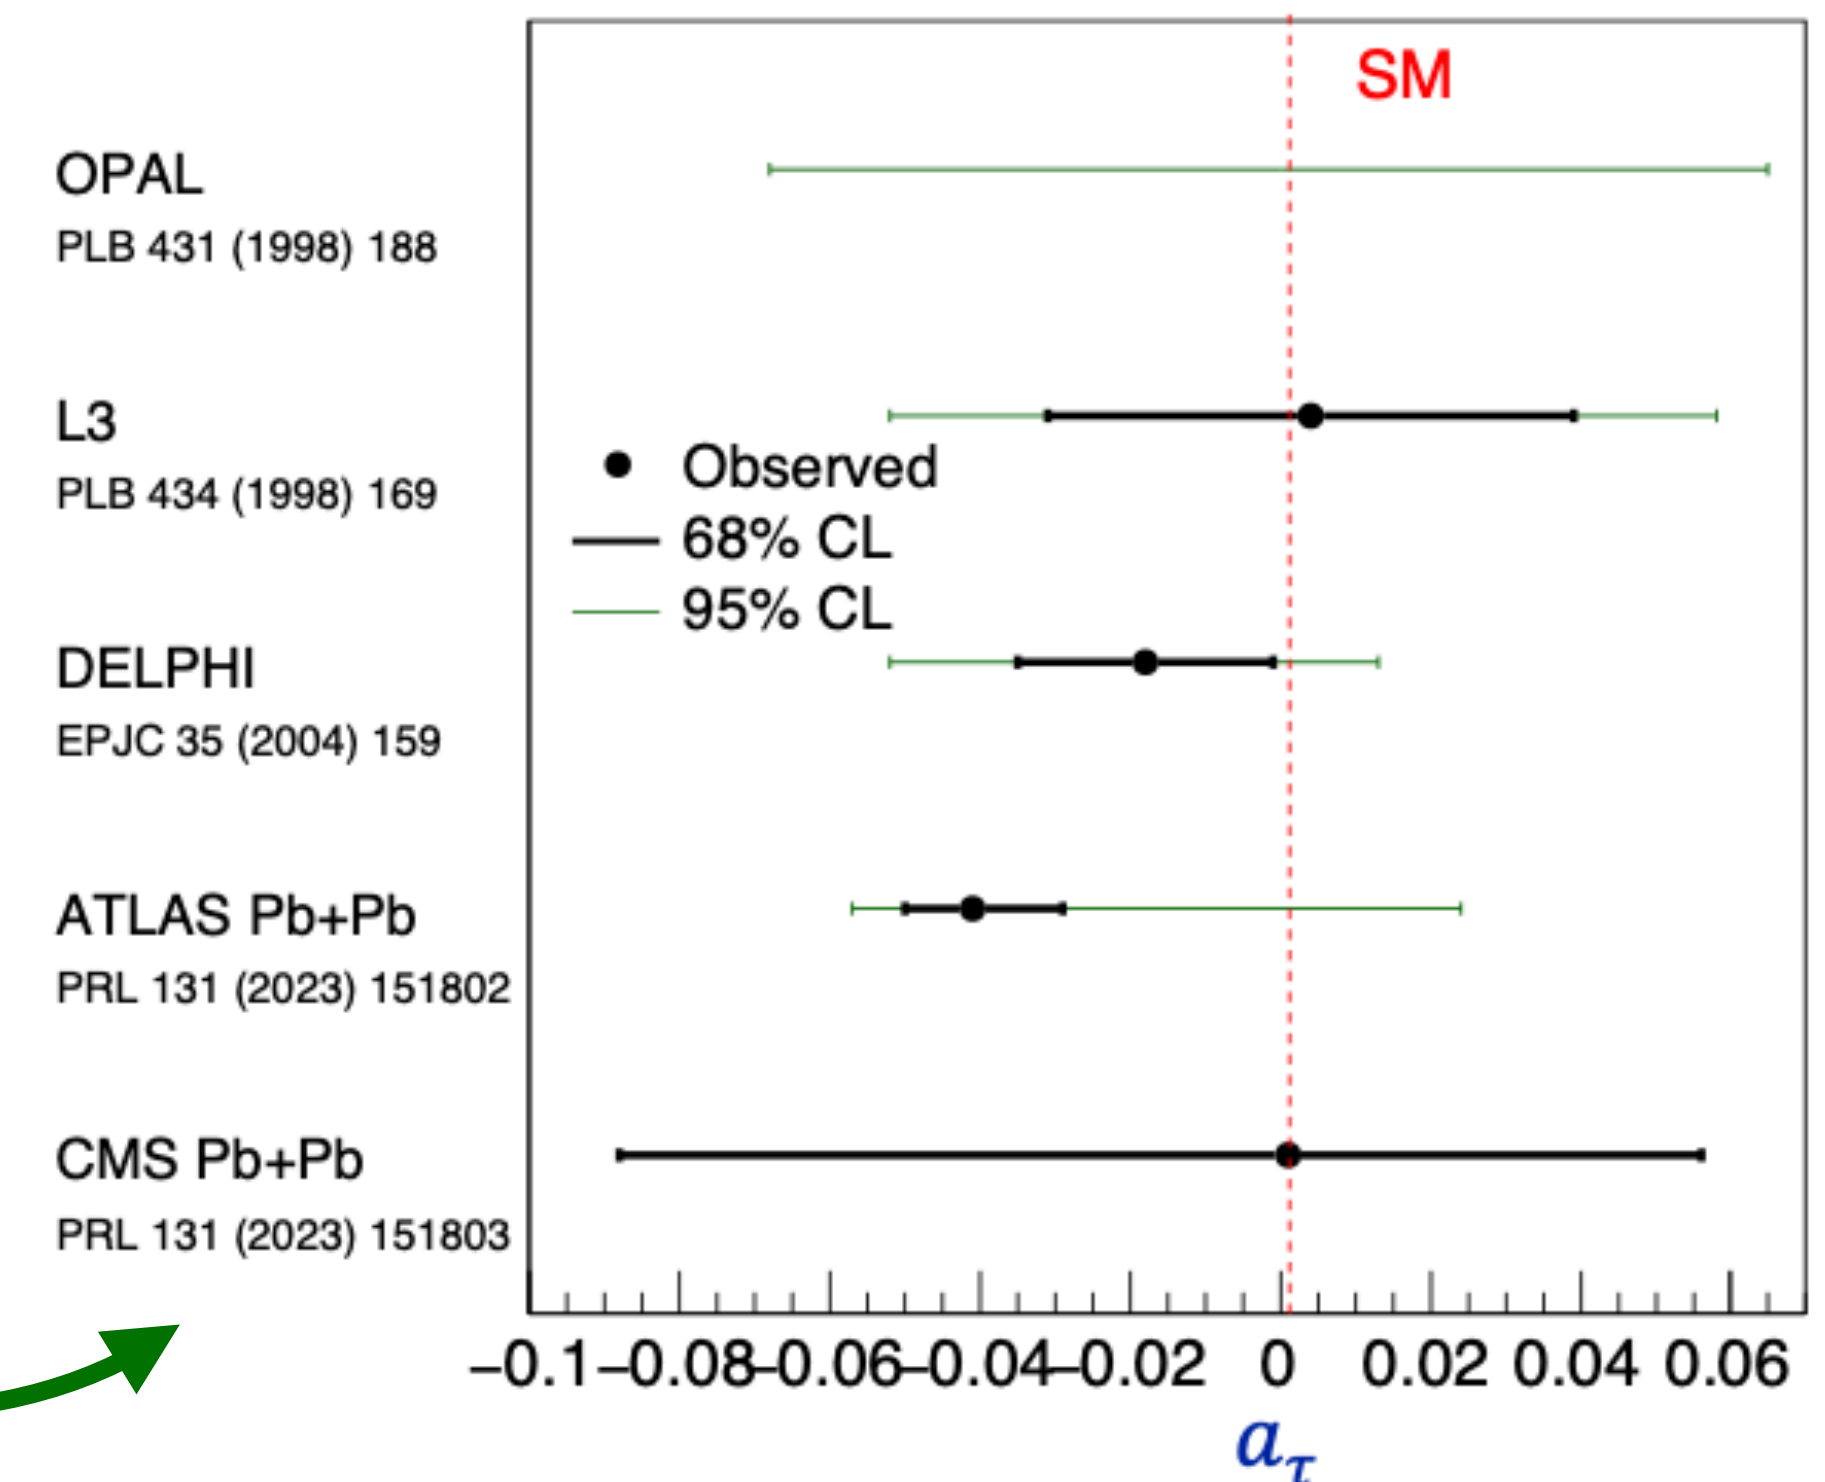

$$\mu = g \frac{e}{2m} \mathbf{S} \rightarrow \begin{cases} g = 1: \text{classical} \\ g = 2: \text{Dirac} \\ g \approx 2.002: \text{QED} \end{cases}$$

Key measurements:

- **(g-2)e**: Measured in Penning traps
- **(g-2)μ**: Measured in storage rings
- **(g-2)τ**: Constrained in particle collisions (e^+e^- or PbPb)

CMS as a photon collider experiment

- Observed $\gamma\gamma \rightarrow \tau\tau$ production for the first time in pp collisions
- Probed tau g-2 with unprecedented precision

Isolate signal at low track multiplicity

CMS

- Observed — 68% CL — 95% CL

Rep. Prog. Phys. 87 (2024) 107801

Motivation for determining α_S

- Single free parameter of QCD in the $m_q \rightarrow 0$ limit
- Impact physics at the Planck scale: EW vacuum stability, GUT
- α_S is among the major uncertainties of many precision measurements: Higgs couplings at the LHC
- Currently, α_S is the less know interaction couplings

The state of the art

Summary of $\alpha_S(m_Z)$

Running of α_S with Q

← World average (**PDG 2024**): $\alpha_S(m_Z) = 0.118 \pm 0.0009$

→ α_S “runs” as $\approx \ln(Q^2/L^2)$ at LO, $L \approx 0.2$ GeV

How to extract α_S at LHC?

$$\boxed{\sigma_{pp \rightarrow X}} = \sum_{ij} \boxed{f_i(x_1, \mu_F^2) \times f_j(x_2, \mu_F^2)} \otimes \boxed{\hat{\sigma}_{ij}(x_1, x_2, \alpha_S(\mu_R), \frac{Q^2}{\mu_R}, \frac{Q^2}{\mu_F})} + O\left(\frac{\Lambda_{QCD}^2}{Q^2}\right)$$

Data $\sigma(exp)$ **PDFs $f_i(\mu, x)$** **Partonic XS (pQCD)**

DGLAP eq. Exp. measurements *need to be corrected by non perturbative effects*

Two methods to compare $\sigma(exp)$ to $\sigma(pQCD)$:

- **Profiling analysis using varying PDF+ α_S** (predefined PDF from global PDF)
- **Simultaneous fit of α_S and PDFs**
 - Correlation between PDFs and α_S took into account
 - Reduced bias
 - BUT time consuming

ATLAS $Z p_T$ [arXiv2309.12986](https://arxiv.org/abs/2309.12986)

- **$Z p_T$ sensitive to $\alpha_s(m_Z)$**
- Cross-sections in $p_T - y$ in **full lepton phase space** at 8 TeV ([EPJC 84 \(2024\) 315](https://arxiv.org/abs/2309.12986))
- **Theory predictions at $N^4LLa + N^3LO$**

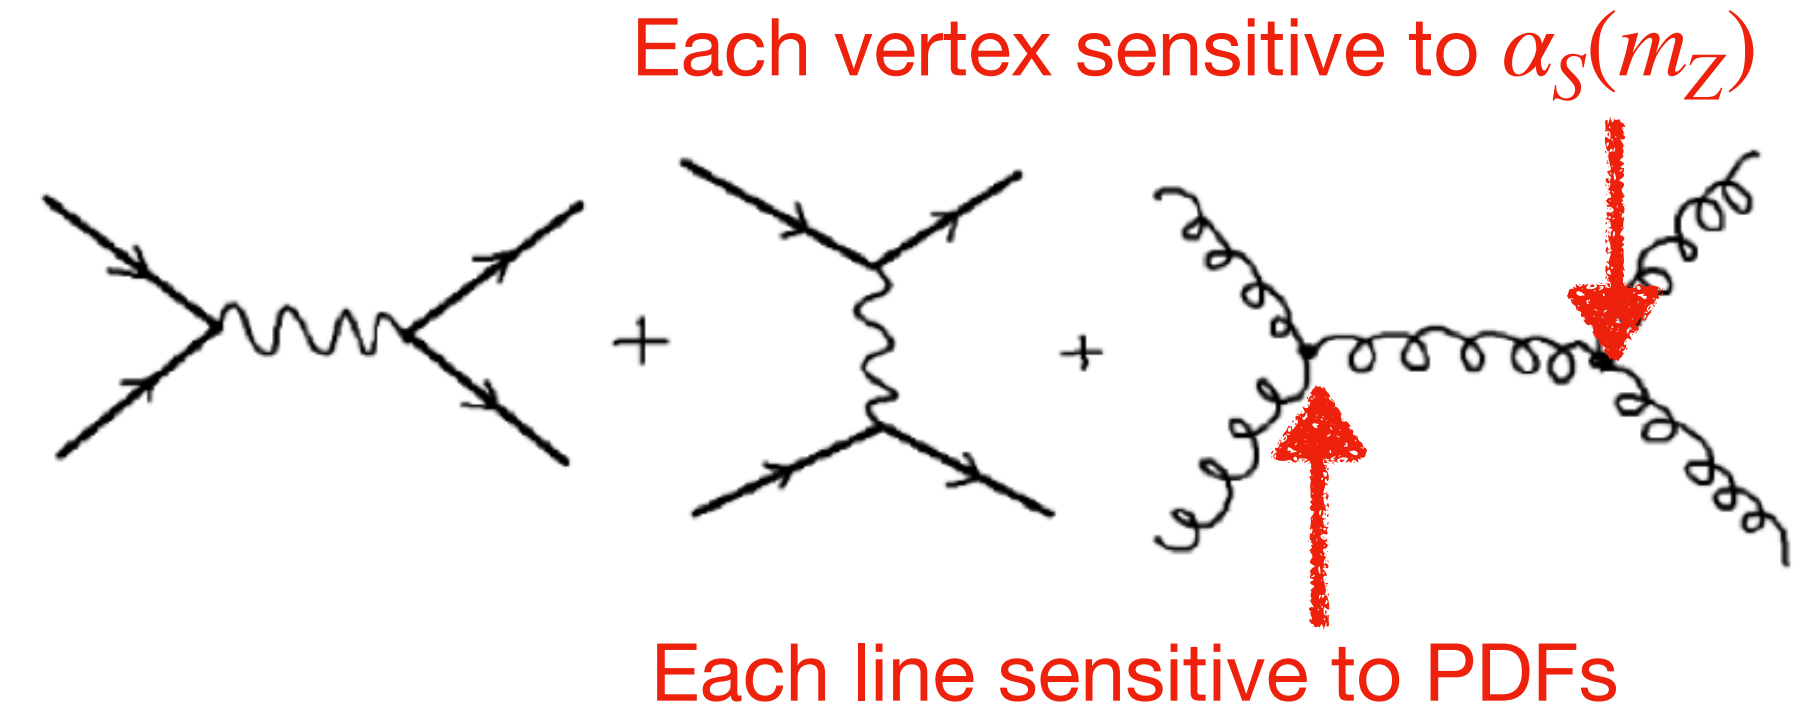

MSHT20aN3LO PDF set used to extract $\alpha_s(m_Z)$

Final result: $\alpha_s(m_Z) = 0.1183 \pm 0.0009$

Most precise experimental measurement to date!

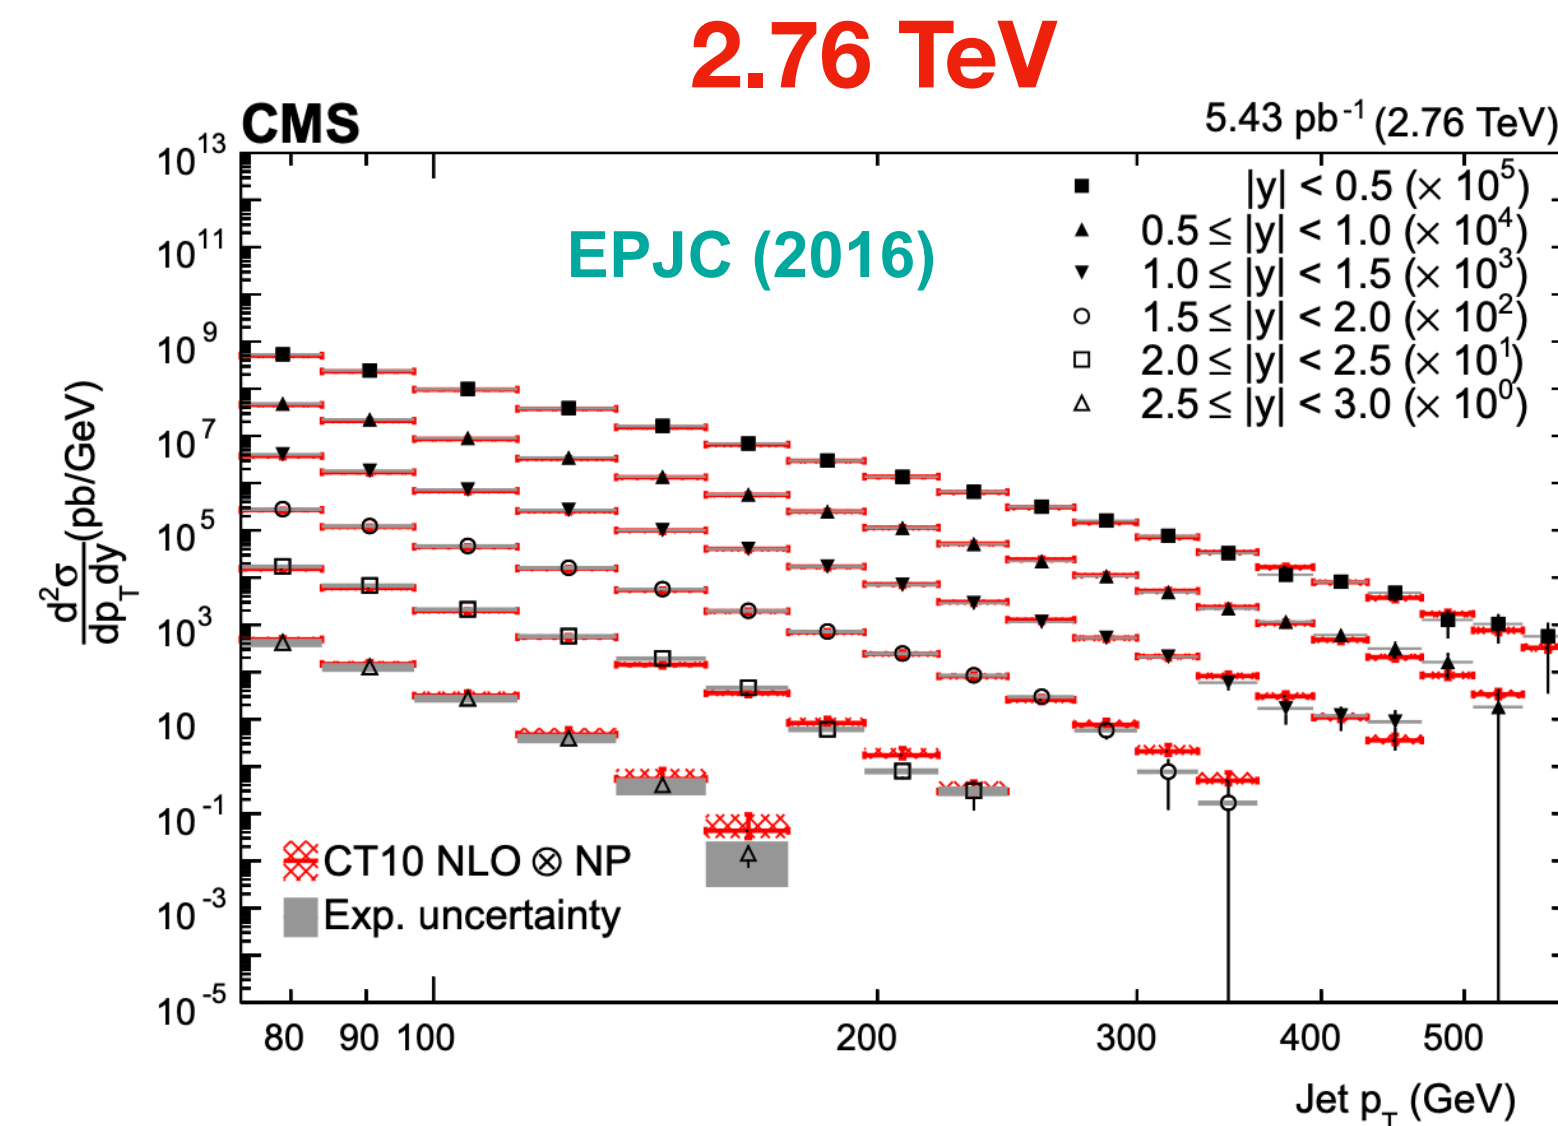

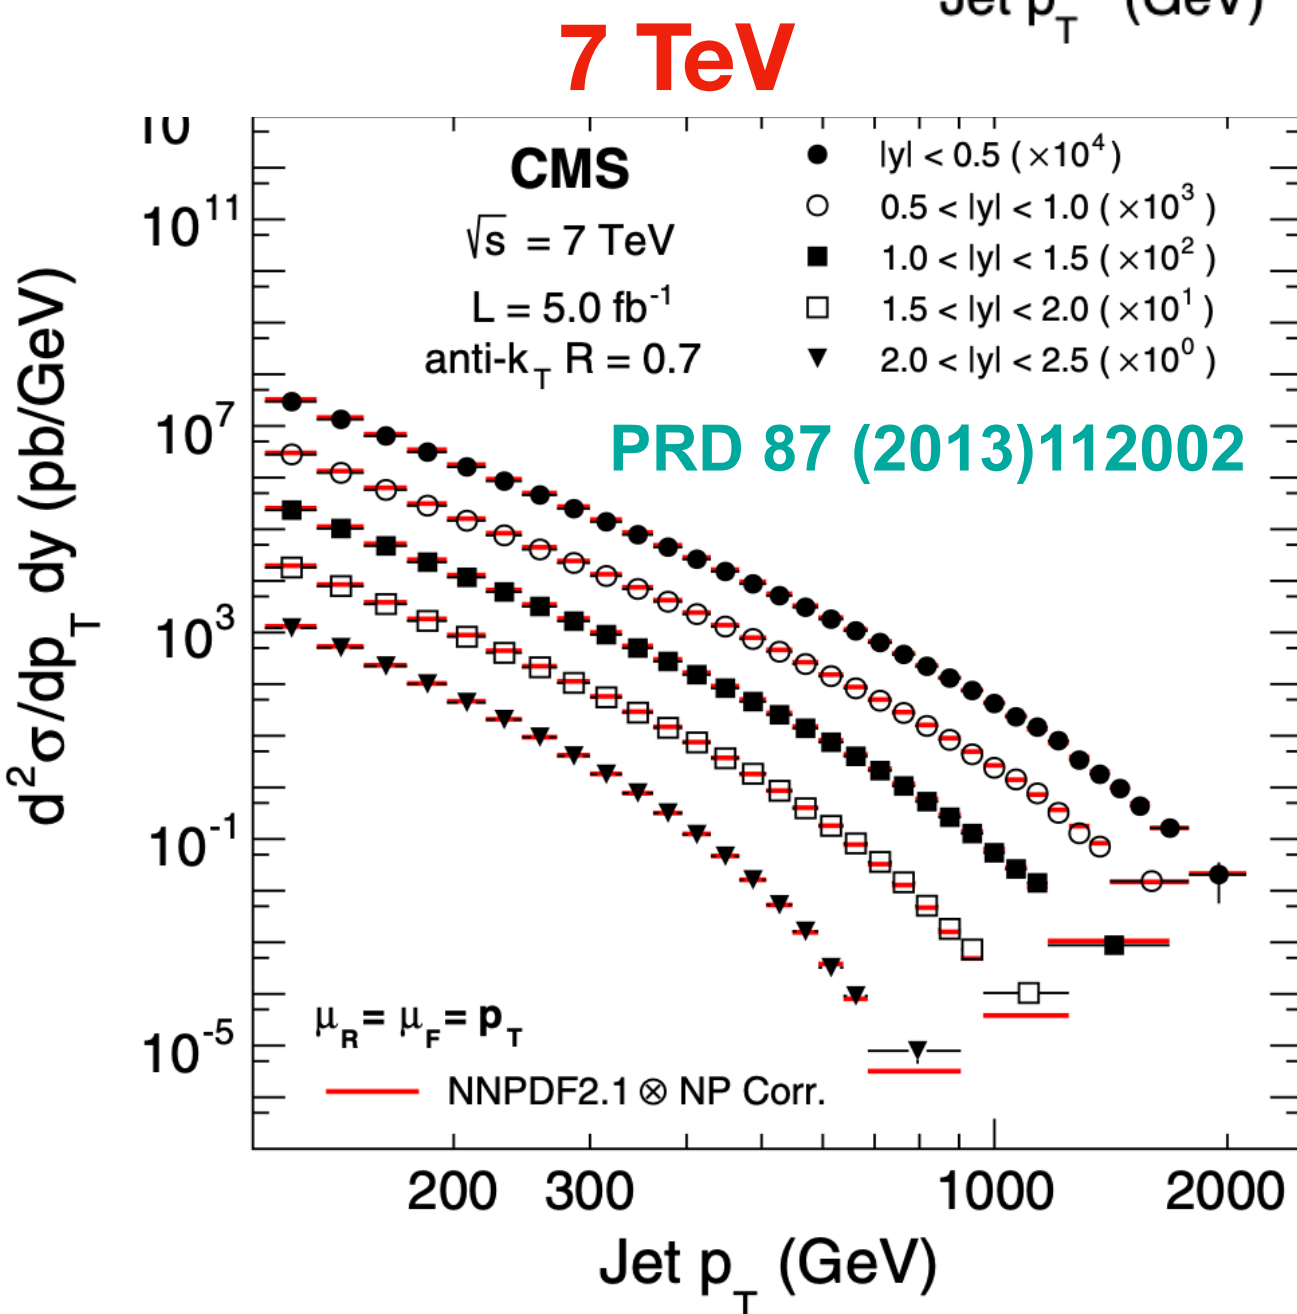

Combination of CMS Inclusive jets [CMS-PAS-SMP-24-007](#)

- **Simultaneous fit of PDF and $\alpha_S(m_Z)$ at NNLO** \rightarrow correlation between PDFs and $\alpha_S(m_Z)$ taken into account
- **Correlation of jet measurements studied**

Final result: $\alpha_S(m_Z) = 0.1176^{+0.0014}_{-0.0016}$

Most precise measurement from jets!

Extraction of α_s running [CMS-PAS-SMP-24-007](#)

Divide data into independent p_T ranges

- In each p_T range, fit PDFs and $\alpha_s(m_Z)$ simultaneously
- Define the center of gravity of each p_T range $\langle Q \rangle$
- Evolve $\alpha_s(m_Z)$ to $\langle Q \rangle$ ([CRunDec package](#))

p_T (GeV)	$\langle Q \rangle$	$\alpha_s(m_Z)$ (tot)	$\alpha_s(Q)$ (tot)
74–220	103.06	0.1182 ^{+0.0013} _{-0.0012}	0.1160 ^{+0.0012} _{-0.0011}
220–395	266.63	0.1184 ^{+0.0011} _{-0.0012}	0.1019 ^{+0.0008} _{-0.0009}
395–638	464.31	0.1179 ^{+0.0012} _{-0.0012}	0.0947 ^{+0.0008} _{-0.0008}
638–1410	753.66	0.1184 ^{+0.0013} _{-0.0012}	0.0898 ^{+0.0007} _{-0.0007}
1410–3103	1600.5	0.1170 ^{+0.0020} _{-0.0016}	0.0821 ^{+0.0010} _{-0.0008}

$\alpha_s(Q)$ in the five p_T ranges are compared to the world average and its uncertainty

- **Running probed up to 1.6 TeV**
- **Good agreement in the entire range**

Summary of $\alpha_s(m_Z)$

- ATLAS (A)TEEC @13TeV: [JHEP 07 \(2023\) 085](#)
- CMS dijets @13TeV: [arXiv312.16669](#), submitted to the EPJC
- CMS azimuthal correlation $R_{\Delta\phi}$ @13TeV: [EPJC 84 842 \(2024\)](#)
- CMS energy correlators @13TeV: [PRL 133 071903 \(2024\)](#)

Summary and conclusions

- **EW and QCD are interconnected within each other**
- **Numerous results of precision electroweak and QCD physics in the last 12 months!**
- **LHC resulted to be a powerful precision machine for experimental SM measurements**
 - Facilitated by large datasets, detailed understanding of the detectors, dedicated reconstruction techniques and state-of-the-art theory predictions
- **New measurements of electroweak and QCD: $m_W, \Gamma_W, \sin\theta_W, g-2, \alpha_S(m_Z)$**

Thank you

OTHER ANALYSES: single boson, multiboson and boson+jets

- CMS, Z invisible width, at 13 TeV: PLB 842 (2023) 137563
- ATLAS, Z invisible width, at 13 TeV: PLB 854 (2024) 138705
- ATLAS, ZZ at 13.6 TeV: PLB 855 (2024) 138764
- CMS, WW at 13.6 TeV: PLB 855 (2024) 138764
- CMS, WZ, at 13.6 TeV: CMS-PAS-SMP-24-005
- CMS, Zy invisible and triple gauge couplings, at 13 TeV: CMS-PAS-SMP-22-009
- ATLAS, WZy, at 13 TeV: PRL132 (2024) 021802
- CMS, WWy, at 13 TeV: PRL132 (2024) 121901
- ATLAS, Z+jets, at 13 TeV: JHEP 06 (2023) 080
- CMS, Z+jets, at 13 TeV: EPJC 83 (2023) 722
- CMS, W Boson Decay Branching Fractions (SMP-24-009)
- LHCb, Z production cross-section, using 5.02 TeV: JHEP 02 (2024) 070

Effective weak mixing angle

- The Forward-Backward asymmetry AFB increases with the Z boson rapidity
 - Only valence quarks contribute to the AFB
- Ambiguity in quark direction resolved through rapidity-dependent measurement
- Experimentally defined as

$$A_{FB}^{\text{CMS}} = \frac{N(\cos \theta > 0) - N(\cos \theta < 0)}{N(\cos \theta > 0) + N(\cos \theta < 0)} \quad A_{FB}^{\text{LHCb}} = \frac{N(\eta^- > \eta^+) - N(\eta^- < \eta^+)}{N(\eta^- > \eta^+) + N(\eta^- < \eta^+)}$$

$\gamma\gamma \rightarrow \tau\tau$ in pp collisions

- **$(g-2)_\tau$ has a strong potential to probe new physics**
 - Expect large BSM enhancement at high p_T and $m_{\tau\tau}$
- ATLAS and CMS have put limits on α_τ using PbPb
 - $\sigma \approx Z^4$
 - Sensitive to $m_{\tau\tau} < 40\text{GeV}$
- New CMS results in pp collisions ([Rep. Prog. Phys. 87 \(2024\) 107801](#)):
 - Using exclusivity cuts on coplanarity and N_{tracks}
 - Fitting shape and yield in $m_{\tau\tau} > 50\text{GeV}$
- Electric dipole moment

g-2

CMS
 $\gamma\gamma \rightarrow \tau\tau$ (γ from p)
This result

$$\alpha_\tau = \frac{g_\tau}{2} - 1 = 0.0009^{+0.0032}_{-0.0031}$$

Dominant contributions to uncertainty

- **CMS mW:** $80360.2 = 2.4 (stat) \pm 9.6 (syst) \rightarrow p_T^\mu$ scale (4.8 MeV), PDF (4.4 MeV)
- **ATLAS mW:** dominated by PDF, EW and muon and electron calibration
