

HL-LHC BLM layout proposal for IP1 & IP5

B.Salvachua, S.Morales (SY-BI)

Valuable contributions from R.Calaga, E.Effinger, N.Joannon, A.Lechner, F.P.Nicoletti,
F.X.Nuiry, J.Oliveira, F.Sanchez Galan, G.Girardot, C.Zamantzas

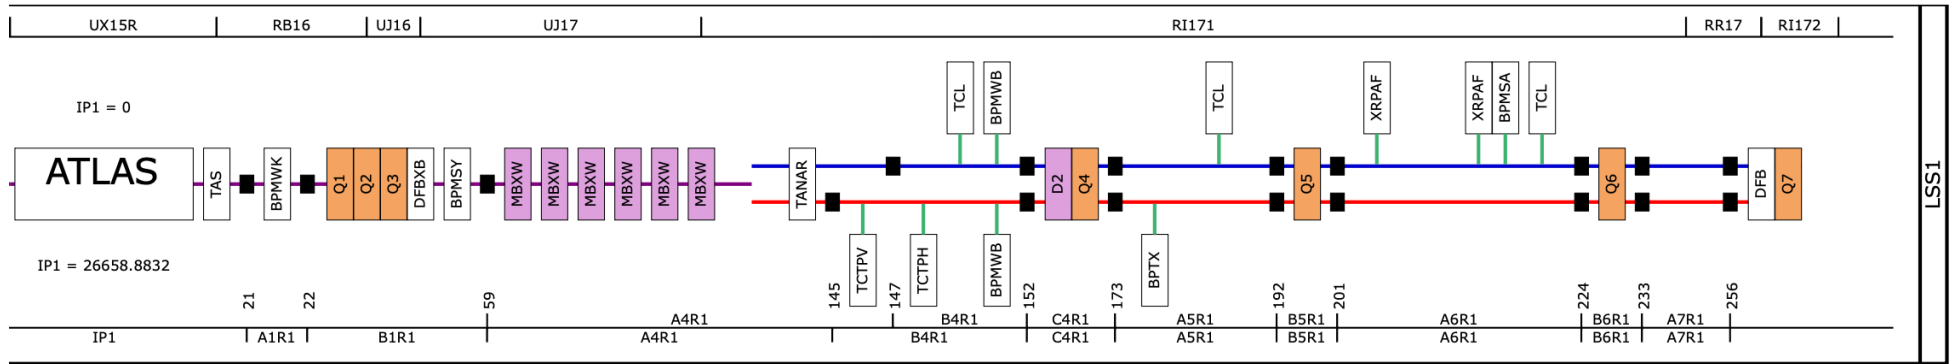

27 May 2024 - BLMTWG #99 BLM Thresholds Working Group

Introduction

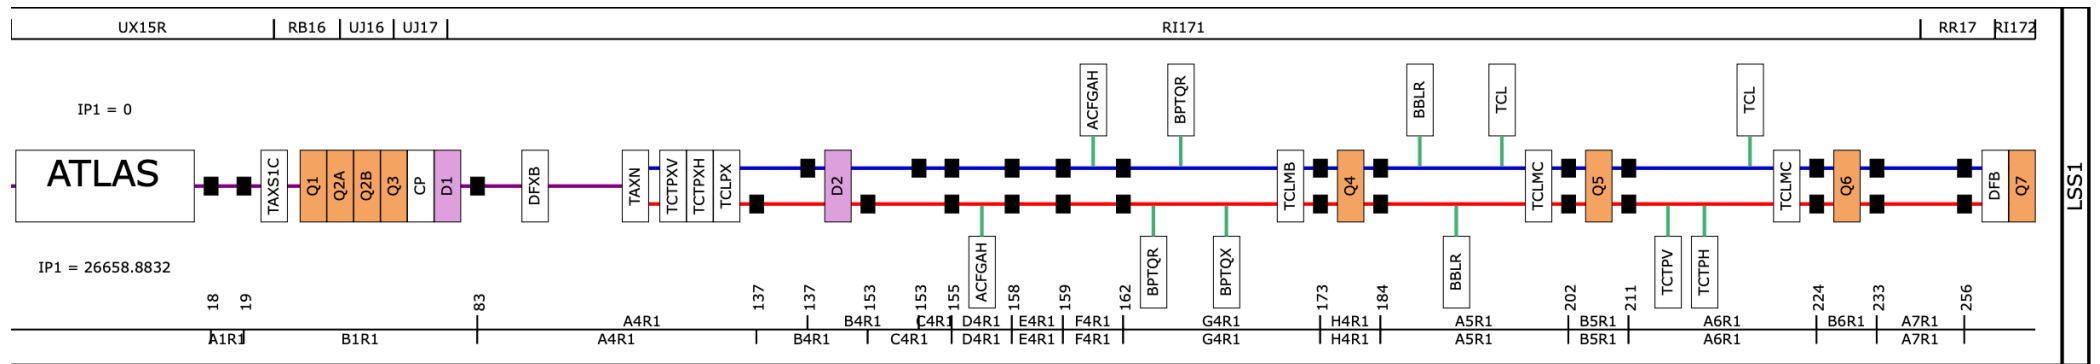

Several upgrades for HL-LHC with the goal of increase the integrated luminosity by a factor of 10 beyond the LHC design values (250 fb⁻¹/year for 12 years)

- Cell1 to Cell3 will be completely renovated
- Cell4 to Cell6 new recabling, new elements and displacement of present elements

LHC today

HL-LHC

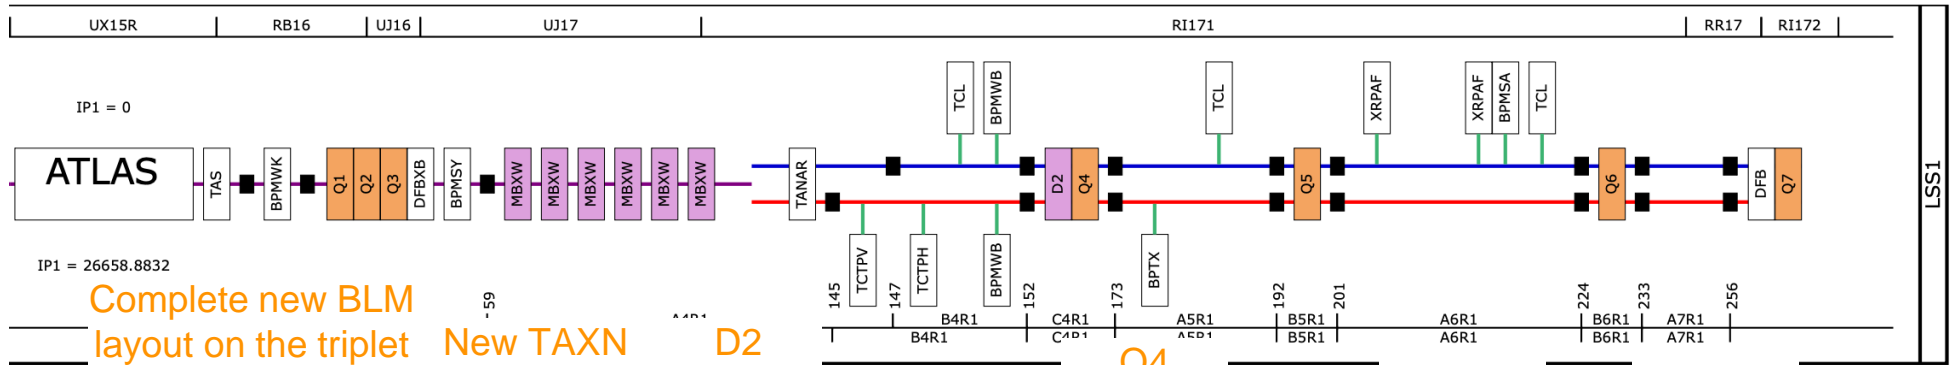

Figures from <https://accelerator-synoptics.web.cern.ch> (the distances in the figure are not to scale)

BLM layout for IP1/IP5

Cell 1 to Cell 3:

- New layout for Cell 1 to Cell 3 for the renovation of the triplet area

Cell 4:

- New TAXN
- New TCTPXH, TCTPXV and TCL4
- D2 which is separated from Q4
- Crab-Cavities
- Q4 which is separated from D2
- BBLR (between Cell4 and Cell 5)

Cell 5:

- TCL5
- Q5 displaced

Cell 6:

- TCTPV, TCTPH
- TCL6
- Q6 displaced

Triplets BLM layout (Cell 1 - Cell 3)

Integration started long time ago ~ 2020

- HL-LHC WP15 Integration meeting: <https://indico.cern.ch/event/968283/> with the estimation of number of BLM monitors in that area to go through the cabling request.
- Several discussions since then but integration was not finalised.
- Most material is in BI-BL cernbox folder until formalised into ECR

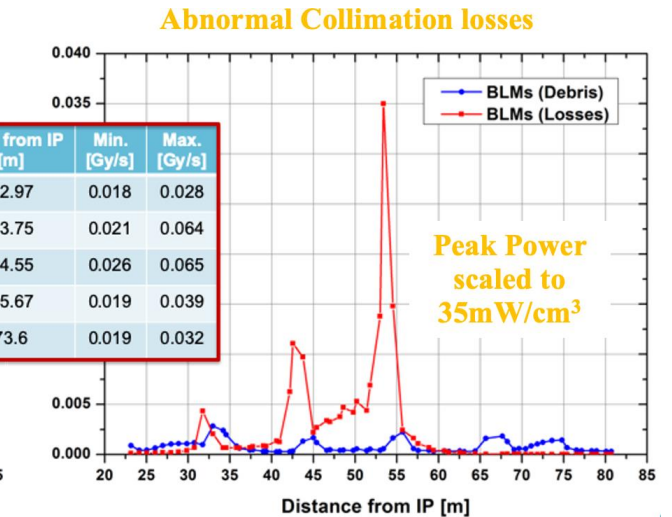

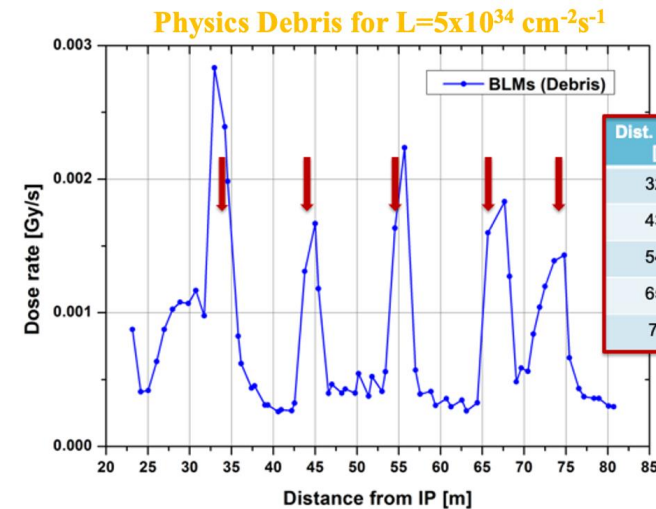

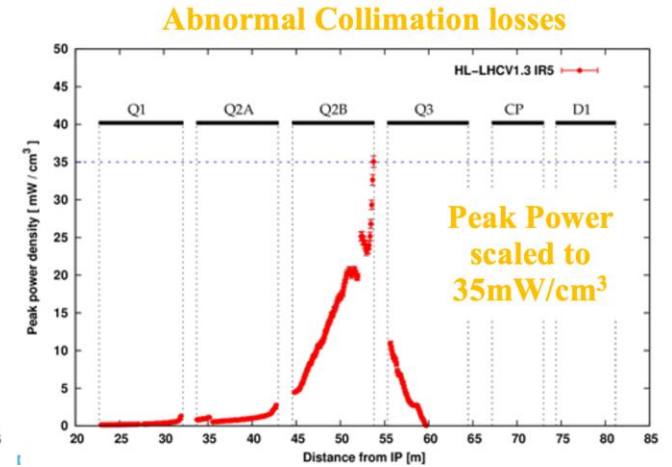

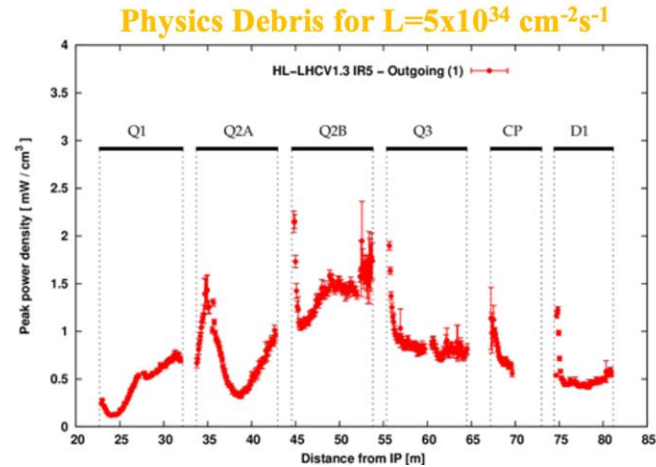

[CERNBox/eos/project/be-bi-bl/BLM/BLMLHC_LS3_HL](https://cernbox.cern.ch/project/be-bi-bl/BLM/BLMLHC_LS3_HL)

Expected beam loss contribution on the triplets:

- Two beam loss contributions:
 - [physics debris + abnormal collimation losses \(accidental loss scenario\)](#)
- Difficult to disentangle from these two contributions as the BLM detectors will measure both.

Recap of beam loss simulations

- Tracking simulations of beam losses in the HL-LHC triplet, Ye Zou ([HL-LHC WP13](#))
- BLM response simulations for the HL-LHC triplet, Andrea Tsinganis ([HL-LHC WP13](#)) using layout optics HL-LHC v1.3, 255 μrad half crossing angle, $\beta^*=20\text{cm}$.

Similar signal for Internal or External BLM
BLM on top of the interconnect has more signal due to less shielding

Initial BLM detectors proposal

BLM detectors in LHC triplet:

- 2 detectors/beam/quadrupole with additional monitors for the DFB
- No monitors installed in the warm D1
- Total of 19 detectors between 20-90 m from IP

HL-LHC triplet (2020):

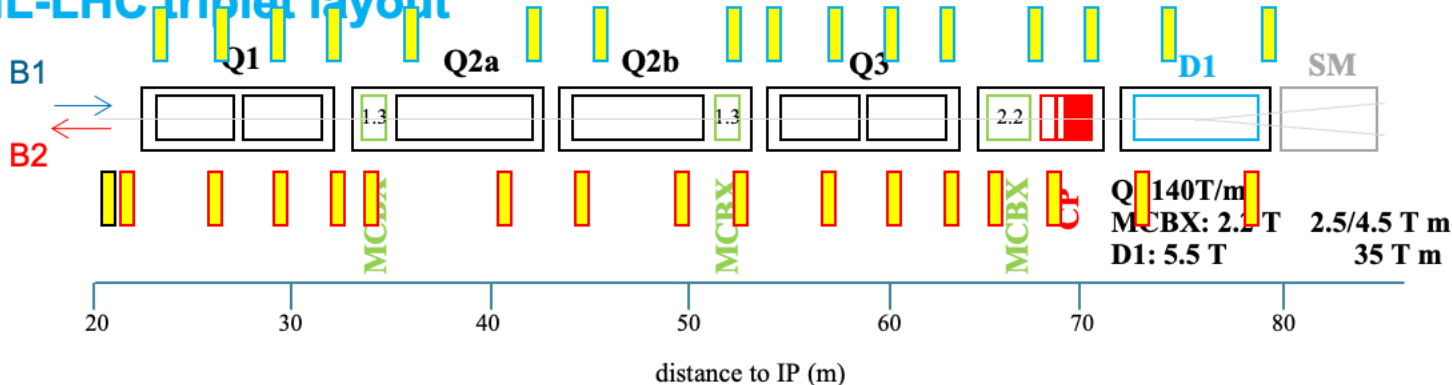

- 2 detectors/beam/quadrupole including superconducting D1 and CP
- Total of 33 detectors between 20-90 m from IP:
 - 8 BLM at Q1/Q2/Q3
 - 4 BLM at D1 and 4 BLM at CP
 - 1 BLM BPMSW @ 21 m
- Additional monitors in selected locations read-out by the R&D rad-hard read-out with ASIC.

See next talk by C.Zamantas

LHC triplet layout

HL-LHC triplet layout

Update on 2024:

- Avoid External side of the ring - difficult/impossible of access for maintenance and irradiation test.
- Reduce number of detectors with the standard read-out —> lose redundancy
- Add 1 detector at EACH location with the new ASIC read-out —> gain redundancy

Integration of cell 1 - cell 3

N. Joannon EN/ACE/INT

Integration BLMs for HL-LHC

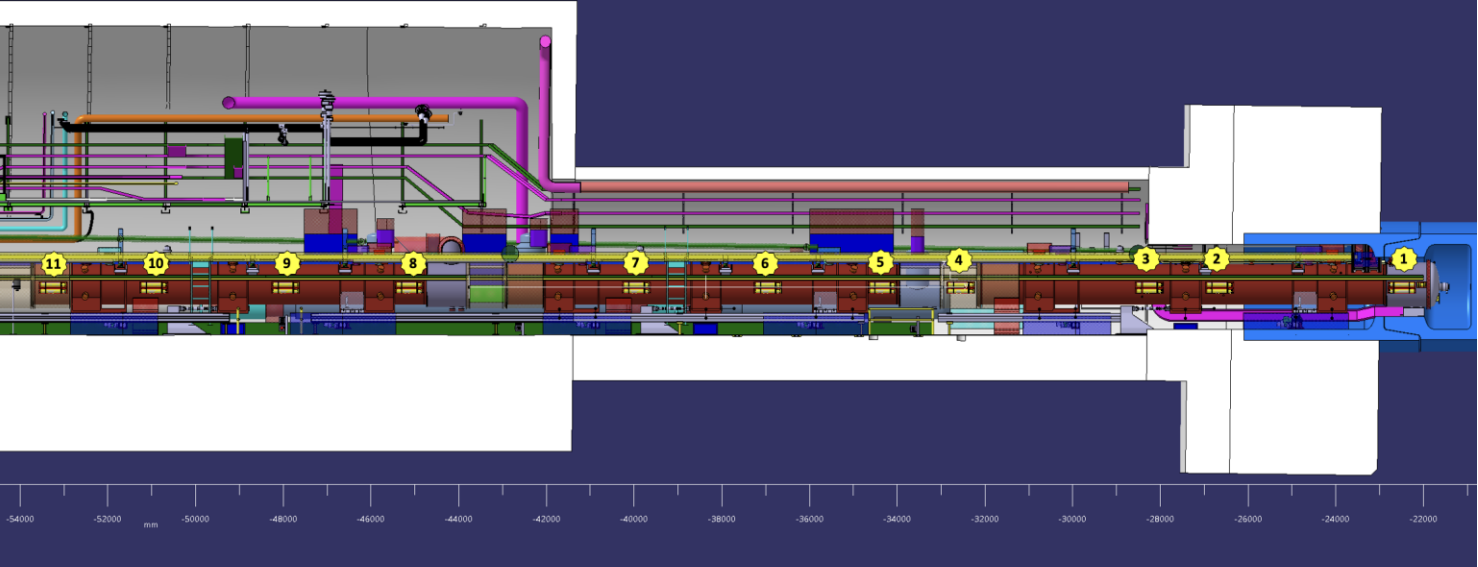

All proposed cell1-3 locations have been discussed and analysed. A complete the integration study has been done. Few modifications need to be checked.

Integration BLMs for HL-LHC | N. Joannon, on behalf of EN/ACE/INT

1 BLM read by standard BLM electronics (no change wrt LHC)

1 BLM read by new rad-hard electronics.

Integration BLMs for HL-LHC | N. Joannon, on behalf of EN/ACE/INT

2024-04-16

HL-LHC from cell 1R1 to 3R1

Proposal for Expert names

Notice:
B0 but position at element (10,20,30) is with respect the outgoing beam.

Corrections to this layout proposal

Small modifications to be assed with integration (equivalent for all IP1/IP5 L/R):

- Q3 BLMQI.03R1.B0I21_MQFA to be displaced -1 m
- Q3 BLMQI.03R1.B0I30_MQFXA (should be at the end, currently at the middle) to be displaced + 2m
- CP the 3 BLMs 10,20,30 to be displaced + 2 m
- D1 BLMBI.04R1.B0I10_MBXF_D1 to be displaced + 1 m

Please have a look for additional changes and do not hesitate to send us feedback
Both on position and naming

Cell 4 - Cell 6

HL-LHC

Let's now propose the layout for the rest of the LSS

TAXN

F.Sanchez Galan

Holding the recombination chamber and several detectors (ZDC ad BRAN)

Proposal to add 1 BLM for the TAXN (towards the IP), similarly to the present configuration.

Integration not done yet, but there is space, we just need to avoid the reserved space on the side and the removal/installation of the TAXN.

Installation could be done with the standard BLM support.

We do not install another BLM after the TAXN because cell 4 collimators are right after (TCT BLM between collimator and TAXN)

TAXN

BLM

Collimators - Cell 4/5/6

F-X. Nuiry

Adapting BLM support in collaboration with STI

TCTs in Cell 4 and Cell 6

TCL4, TCL5 and TCL6

Integration needs to be finalised, work on going with STI for the supports and locations of BLMs.

Space is very tight, but we are aiming at making a more uniform configuration.

We provide today the approximate locations of the BLMs to be verified with integration WP15 (attached to the agenda)

D2 and Crab-Cavities

For HL, D2 is separated from Q4.
We need certain monitoring.

Proposal

2 BLMs:

- 1 between D2 and the correctors
- 1 on the correctors side
- Already 1 BLM expected between TCL and D2

In this area, we are adding BLM external/internal in order to keep it similar to present system.

D2 and Crab-Cavities

R.Calaga

HL-LHC from cell 4R1 to 4R1

Proposal

2 BLMs

- 1 BLM upstream
- 1 BLM downstream

No installation on the side of the cavities, because there is no space, since the cryogenics go up to the transport area.

Q4 and BBLR

HL-LHC from cell 4R1 to 4R1

Proposal
 6 BLMs
 • Similarly distributed as Q5/Q6

Q4 and BBLR

Proposal
 2 BLMs
 • Before/After

Q5 and Q6

HL-LHC from cell 5R1 to 6R1

6 BLMs per quadrupole

HL-LHC from cell 4R1 to 6R1

Conclusions

Draft of all BLM layout from Cell 1 to Cell 6.

248 BLMs in total IP1 + IP5 (with additional 92 for the new ASIC read-out)

Missing only to include XRP - but for IP5 the BLMs will be integrated in the XRP support directly.

Next:

- Share the new BLM positions with integration to finalise the layout
- Integrate BLM signal and power boxes
- Integrate ASIC crates (3 per IP-side)

BACK-UP

Approximate positions Cell 1 - 3

- Approximate locations for the placement of the monitors:
 - After interconnect + middle/close to interconnect + after interconnect + before interconnect
 - Q1: 21 (IC+LIC) + 27 + 28 + 32
 - Q2: 34 + 37 + 40 + 45 + 48 + (51) + 53
 - Q3: 56 + 59 + 61 + 63
 - CP: 65 + 70 + 71.5
 - D1: 74 + 77 + 80
 - IC right after D1

HL-LHC from cell 1R5 to 3R5

HL-LHC from cell 3L1 to 1L1

HL-LHC from cell 3L5 to 1L5
