Differential branching fractions for the rare decay B_s to $\phi(1020) \mu \mu$ using Run II data at 13 TeV

The differential branching fractions results for the flavor changing neutral current B_s to $\phi(1020) \mu \mu$ are shown as a function of dimuon mass squared using the integrated luminosity of 137.5 fb of data collected by the CMS detector at center of mass energy of 13 TeV
