ADL/CutLang developments

Sezen Sekmen (Kyungpook Nat. U.)

for the ADL/CutLang team

Reinterpretation and OpenMAPP mini-workshop

17-20 June 2024, LPSC Grenoble

Dec 2022

Analysis Description Language

cern.ch/adl

Analysis Description Language (ADL) is a declarative domain specific language (DSL) that describes the ***physics logic*** of a HEP analysis in a standard and unambiguous way.

- External DSL: Custom domain-specific syntax to express analysis-specific concepts. Reflects conceptual reasoning of particle physicists. Focus on physics, not on programming.
- Declarative: Tells what to do but not how to do it.
- Easy to read: Clear, self-describing syntax; organized structure.
- Designed for everyone: experimentalists, phenomenologists, students, interested public…

ADL is framework-independent. Decouples physics information from software / framework details.
—> Any framework recognizing ADL can perform tasks with it.

- Multi-purpose use: Can be automatically translated or incorporated into any language or framework most suitable for a purpose, e.g. exp. analysis, (re)interpretation, queries, …
- Easy communication between groups: exp, pheno, referees, students, public.
- Easy preservation of analysis physics content.

A very simple analysis example with ADL

```
# OBJECTS
object goodMuons
  take muon
  select pT(muon) > 20
  select abs(eta(muon)) < 2.4

object goodEles
  take ele
  select pT(ele) > 20
  select abs(eta(ele)) < 2.5

object goodLeps
  take union(goodEles, goodMuons)

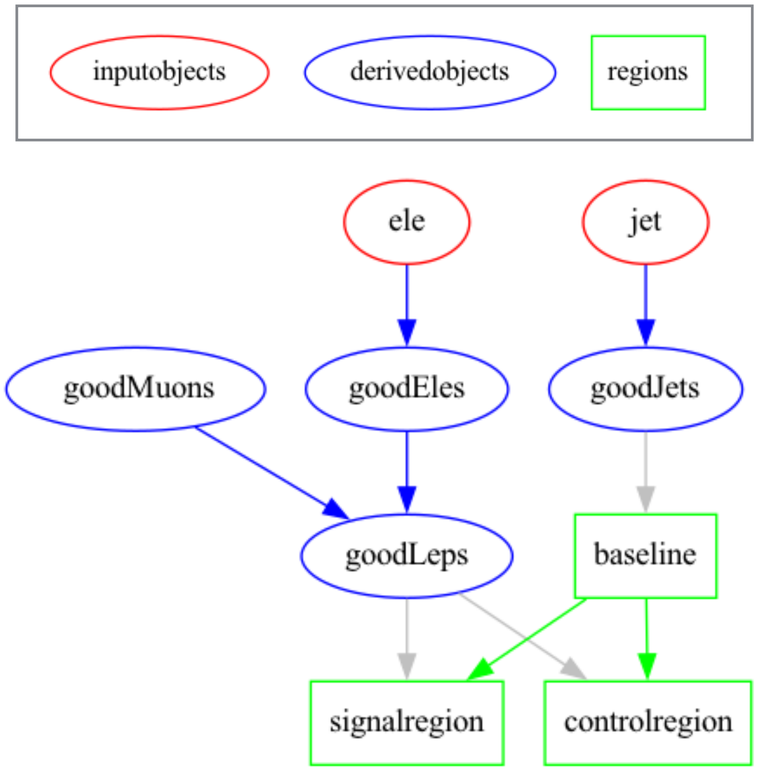
object goodJets
  take jet
  select pT(jet) > 30
  select abs(eta(jet)) < 2.4
  reject dR(jet, goodLeps) < 0.4
```

```
# EVENT VARIABLES
define HT = sum(pT(goodJets))
define MTl = Sqrt( 2*pT(goodLeps[0]) * MET*(1-cos(phi(METLV[0]) - phi(goodLeps[0]) )))

# EVENT SELECTION
region baseline
  select size(goodJets) >= 2
  select HT > 200
  select MET / HT <= 1

region signalregion
  baseline
  select Size(goodLeps) == 0
  select dphi(METLV[0], jets[0]) > 0.5

region controlregion
  baseline
  select size(goodLeps) == 1
  select MTl < 120
```



susysimple.adl

ADL implementations of some LHC analyses: https://github.com/ADL4HEP/ADLLHCanalyses

The ADL construct

ADL consists of

- a plain text ADL file describing the analysis algorithms using an easy-to-read DSL with clear syntax rules.
- a library of self-contained functions encapsulating variables that are non-trivial to express with the ADL syntax (e.g. MT2, ML algorithms). Internal or external (user) functions.

- ADL file consists of blocks separating object, variable and event selection definitions. Blocks have a keyword-instruction structure.
  - keywords specify analysis concepts and operations.

```
blocktype blockname
  keyword1 instruction1
  keyword1 instruction2
  keyword3 instruction3 # comment
```

- Syntax includes mathematical and logical operations, comparison and optimization operators, reducers, 4-vector algebra and HEP-specific functions (dϕ, dR, …). See backup.

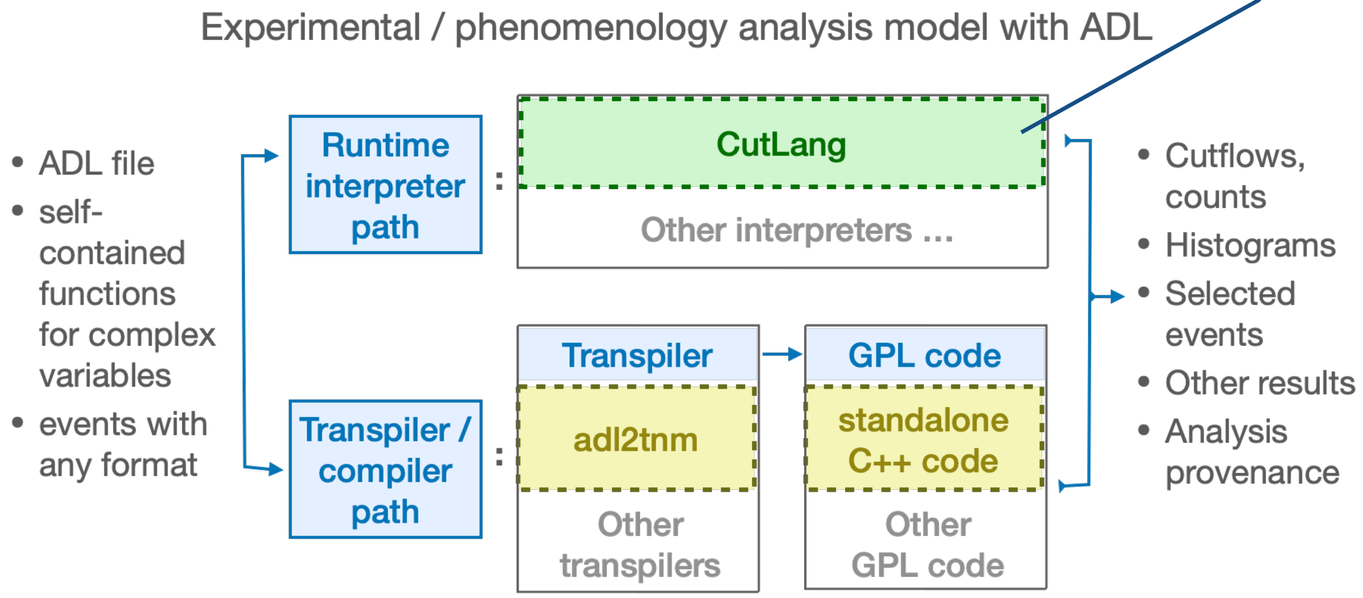
ADL syntax rules with usage examples: link

LHADA (Les Houches Analysis Description Accord): Les Houches 2015 new physics WG report (arXiv:1605.02684, sec 17)

CutLang: Comput.Phys.Commun. 233 (2018) 215-236 (arXiv:1801.05727), Front. Big Data 4:659986, 2021
Several proceedings for ACAT and vCHEP

Running analyses with ADL

Multipurpose & framework-independent: Can be translated / integrated into any GPL / framework.



CutLang: C++ runtime interpreter for ADL.

- Formal grammar parsing by Lex & Yacc.
- Based on ROOT. Reads TTree-like formats. NanoAOD, Delphes, open data, etc. Semi-automated integration of new formats.
- Many external functions, including ML model interface via ONNX.
- Runs in linux, macOS. Available in Docker, Conda. Jupyter kernel exists (binder or conda).
- Outputs cutflows, histograms, events, analysis description, i.e. provenance.

Physics information fully contained in ADL.

Current compiler infrastructures can be easily replaced by future tools / languages / frameworks.

CutLang Github repository: https://github.com/unelg/CutLang
Comput.Phys.Commun. 233 (2018) 215-236 (arXiv:1801.05727),
Front. Big Data 4:659986, 2021 (arXiv:2101.09031),
Several proceedings for ACAT and vCHEP

ML models in ADL/CL

ADL/CutLang can execute ML models in .onnx format via ONNX Model Executor:

All information transparently written in the ADL file

```
# define the list of inputs
define inputlist1 = {var1 var2 var3 …… varN}
# define the ML output
define myMLvar = OME(my/directory/myfunc.onnx, inputlist1, inputlist2, inputvar1, ….)
```

Example from ATLAS-SUSY-2018-30 (multi-b + MET):

```
# define the list of inputs
define NNSRGtt21001Var = {
  pT(jets[0])        eta(jets[0])      phi(jets[0])      m(jets[0])  bTag(jets[0])
  pT(jets[1])        eta(jets[1])      phi(jets[1])      m(jets[1])  bTag(jets[1]) ……(rest of the vars)……..}
define NNmeans = {
  348.82672119140625  0.001224843435920775  0.011215382255613804  35.01051712036133  0.4123765528202057  ……(rest of the vars)…….. }
define NNsigmas = {
  260.26678466796875  1.043735384941101  1.8061413764953613  31.465930938720703  ……(rest of the vars)…….. }
# define the ML output
define NN1Cut = OME("ANA-SUSY-2018-30_model.onnx" , NNSRGtt21001Var, NNmeans, NNsigmas, 0 )
# Use in the selection
region SRGtt21001
  (…. other selection criteria)
  select NN1Cut >= 0.9997
```

ADL/CL for reinterpretation

ADL allows practical exchange of experimental analysis information with the pheno community.

- Clear description of the complete analysis logic.
- Enables straightforward adaptation from experiments to public input event formats.
  - Repurpose ADL files: swap experimental object definition blocks with simplified object blocks based on numerical object ID / tagging efficiencies.
  - Event selections stay almost the same: can swap trigger selections with trigger efficiencies
  - Efficiencies can be implemented via hit-and-miss function (see backup slides).
- Generic syntax available for expressing analysis output in the ADL file: (see backup slides)
  Data counts, BG estimates, signal predictions —> counts, uncertainties, cutflows.
  - Running CutLang puts preexisting results in histograms with the same format as the run output.
    —> Direct comparison of cutflows, limit calculations.
  - Could facilitate communicating information to/from HEPDATA or similar platforms.

Syntax features in backup.

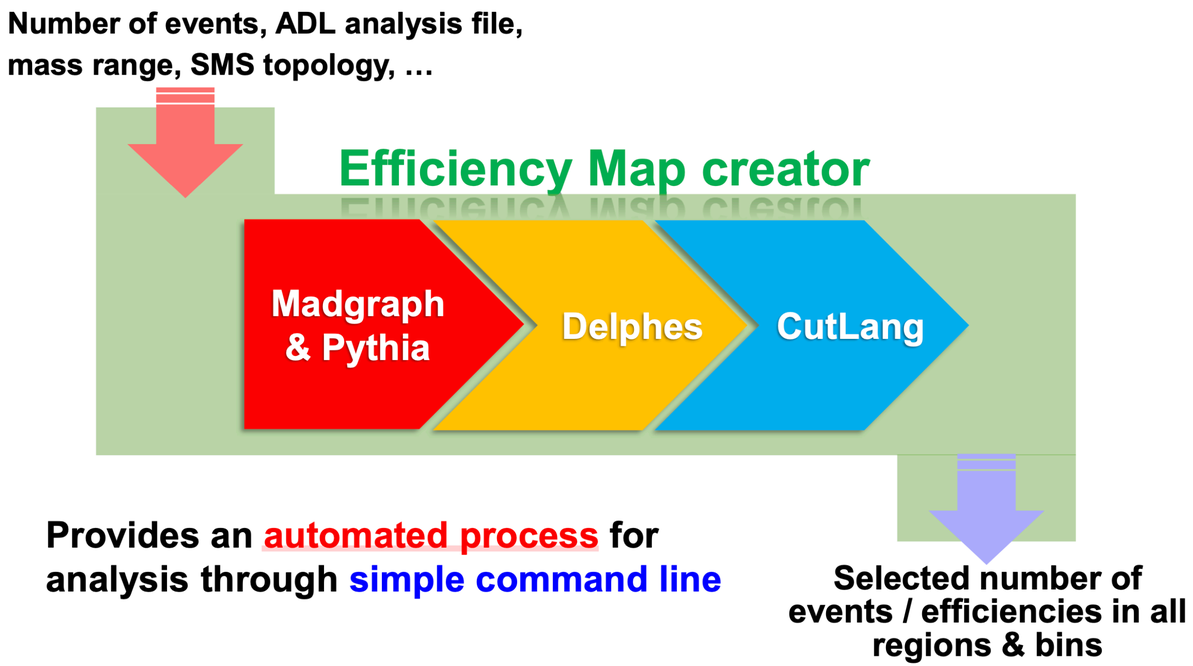
Validation for reinterpretation: Efficiency Map Creator - I

We launched a large scale analysis implementation and validation effort with ADL/CutLang.

- Main focus still SUSY, but also extending to EXO.

Use SModelS Efficiency Map Creator for validation:

- Developed by Wolfgang W. to produce selection efficiency maps on SMSs for input to SModelS.
  - can be used to validate analyses by comparing to experimental results.
  - Configurable user interface: can specify which models and mass points to produce, which steps to run, which output to save.
- EM-creator was adapted to work with ADL/CutLang by Wolfgang W. and Jan Mrozek.
  - Final step: Efficiency maps.
  - Limit calculation currently within SModelS.



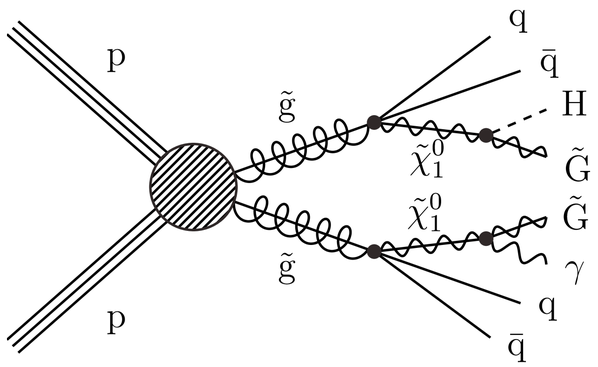
Infrastructure set up in KNU T3, and more adapted for use recently CERN lxplus.

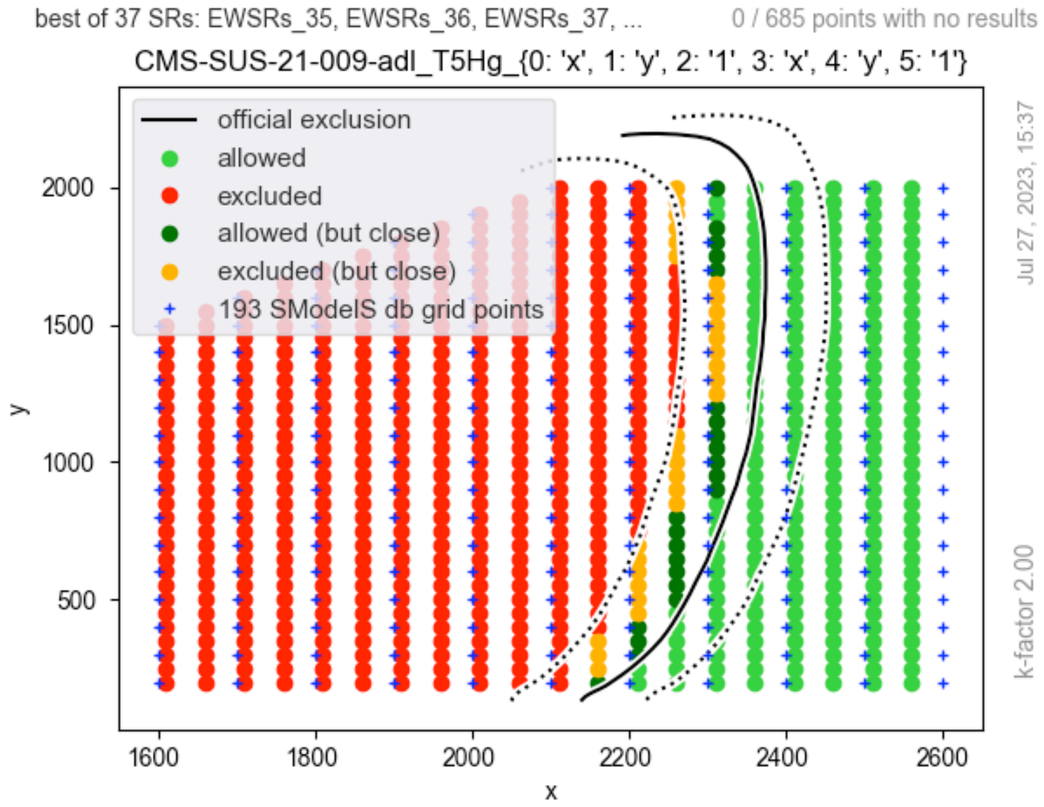
Validation for reinterpretation: Efficiency Map Creator - II

Working to validate several recently published ATLAS and CMS analyses.

- Working with a group of ATLAS and CMS students and partially with CMS analysis teams.

CMS-SUS-21-009: “photons + multijets + MET”.





Analyses we are recently validating

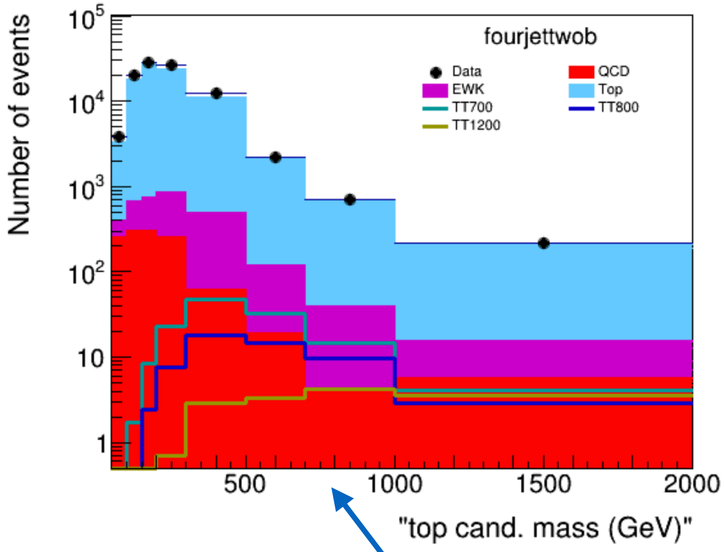
- CMS-SUS-20-003 : Chargino-neutralino production in final states with H-> bb and W boson in lepton + jets + MET
- CMS-SUS-18-004 : 2/3 soft leptons + MET
- ATLAS-SUSY-2018-22 : Search for squarks and gluinos in final states with jets + MET
- ATLAS-SUSY-2019-22 : Search for direct production of winos and higgsinos in events with two same-charge leptons or three leptons.
- ATLAS-SUSY-2018-10 : Search for squarks and gluinos in final states with one isolated lepton, jets + MET
- ATLAS-SUSY-2018-11 : Photons + jets + MET

ADL/CL, LHC Open Data, reinterpretation

ADL/CL can be used to run analyses with ATLAS (educational) and CMS (research) open data.

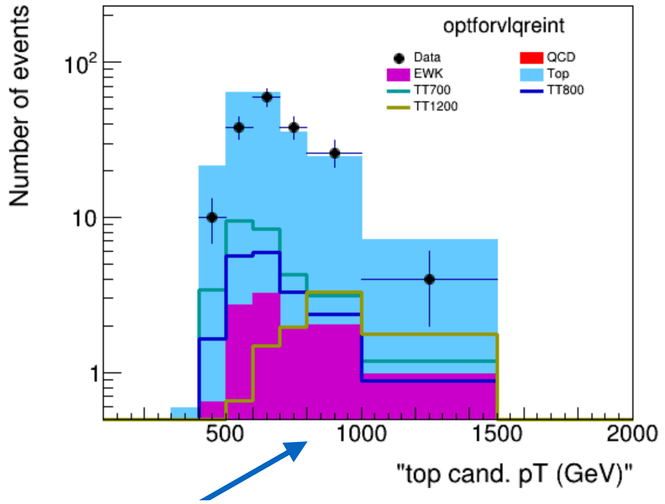
- Use related to reinterpretation: Provide capability to re-optimize and re-run recasted analyses from ADL database to maximize sensitivity to new models.
- A first example / tutorial for “reinterpretation with open data” was prepared using ADL/CL for the 2023 CMS Open Data Workshop in June 2023.
  - Study exact and “optimized” reinterpretation of a ttbar analysis for vector-like T quark signal.
  - Focus on reoptimizing the analysis to enhance sensitivity to VLT (Complete tutorial link.)
  - Runs on a full set of relevant open data & MC events.
  - Runs on a docker container hosting CutLang, ROOT, xrootd access to open data, and VNC.
- Earlier complete tutorial for 2022 CMS Open Data Workshop — reimplement CMS Run 1 vector-like quark analysis with boosted W and Higgs bosons, CMS-B2G-16-024 (Complete tutorial link).
- Next target is to study cases using the newly-released CMS 2016 data in NanoAOD format.

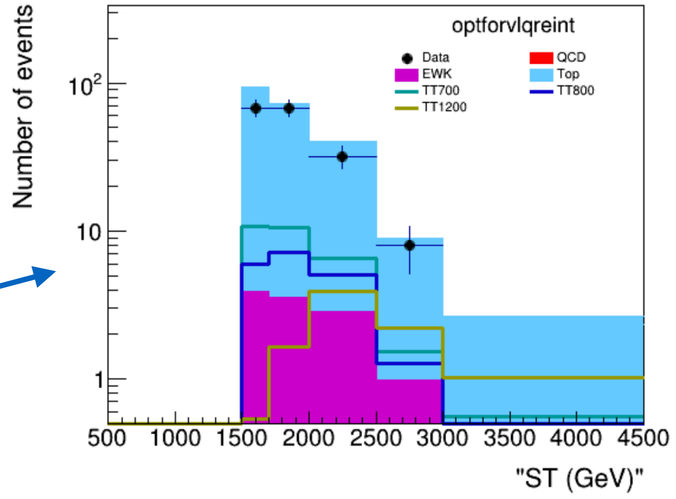
ADL/CL and LHC Open Data - II

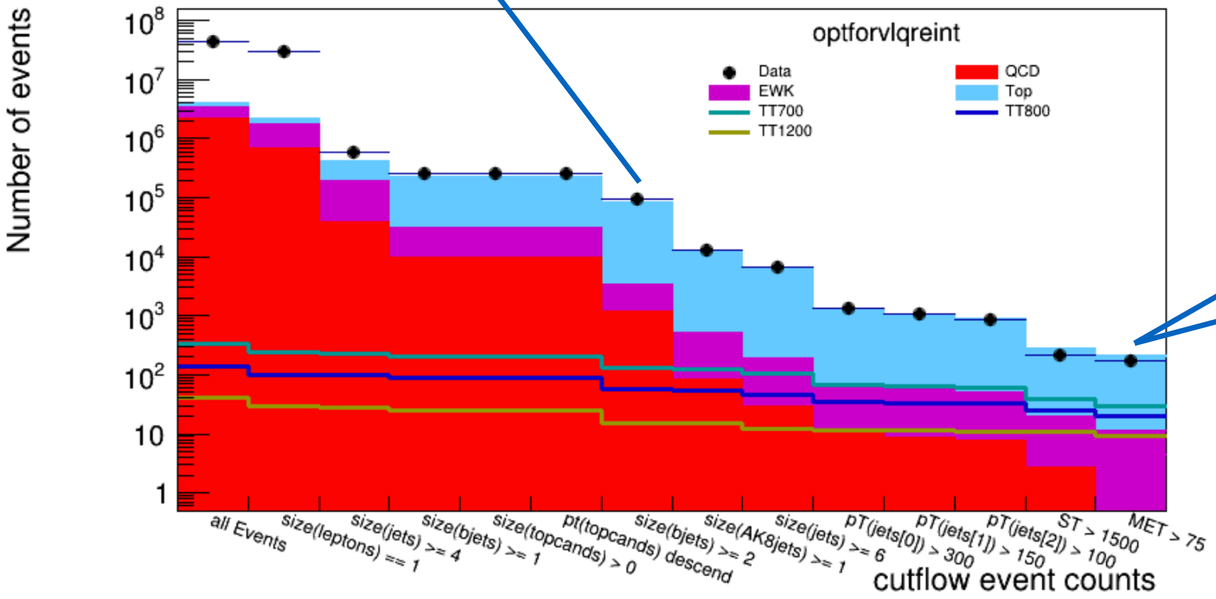


Data, BG and 2 VLT signals vs. top candidate mass for the ttbar analysis selection.

Top candidate mass p_T and ST after reoptimizing the ttbar selection by adding several new cuts. (B2G-16-024 uses ST)







Cutflow histograms automatically generated by CutLang.

Recent infrastructure developments

Various developments in the CutLang core infrastructure:

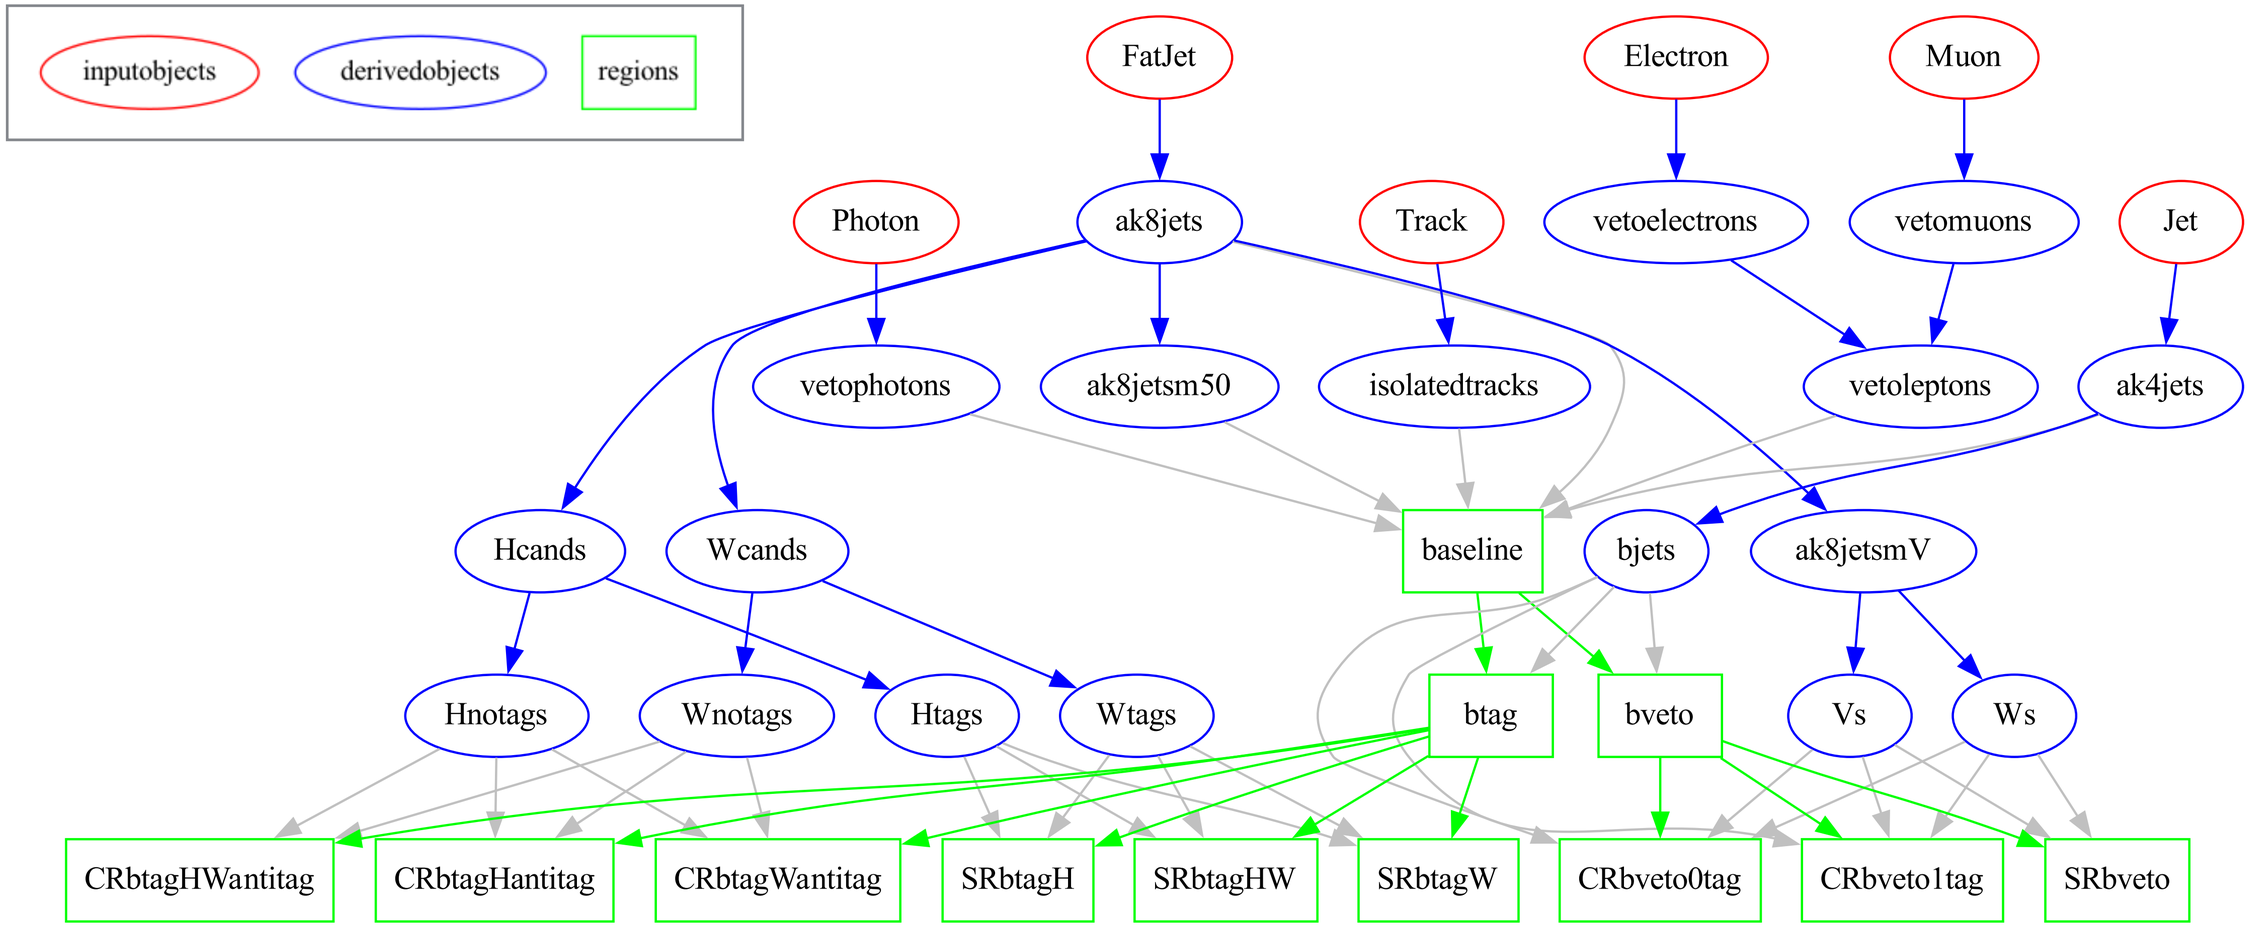
- Automated interface with physics data types and tools: Can read different input data formats and matching with representation in ADL.
- Decoupled the grammar implementation from input data attributes, external functions, … :
  - Particle and function names are no longer needed to be hardcoded in the ADL parser.
  - After initial parsing, function and particle names are matched to those within an external library .

  => Portability of different data types, attributes, functions.
- Abstract syntax tree (AST) can now be automatically generated.
- Visualization tool adl2flowchart deployed: Auto-converts analyses to graphs / flowcharts via AST.

- Infrastructure in place and partially deployed. Tests ongoing.

ADL for automated visualization - I

Analysis flowcharts can now be automatically generated from the ADL file via the abstract syntax tree using the graphviz-based setup adl2flowchart.

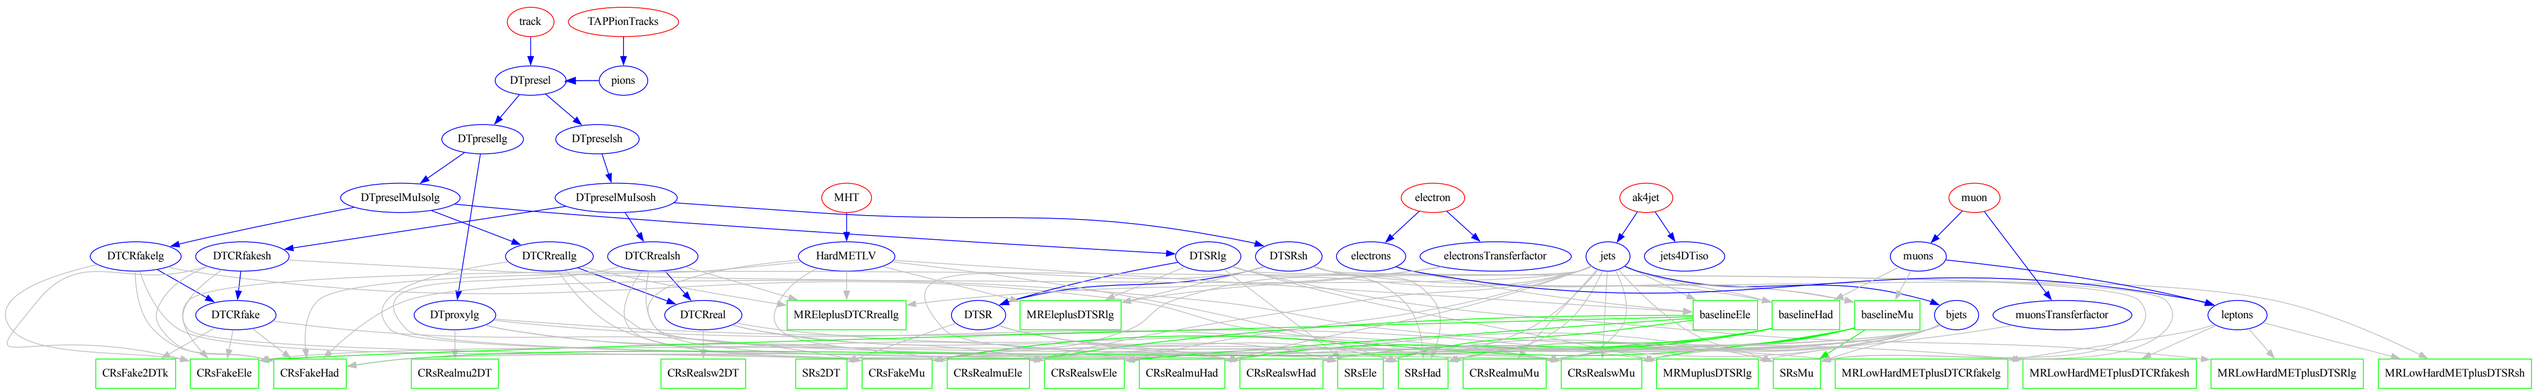


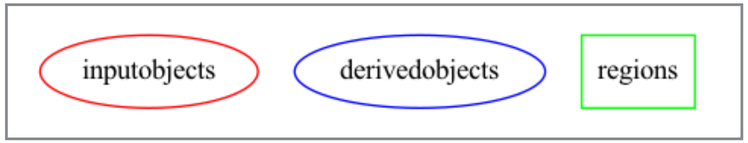
CMS-SUS-21-002: Search for EWK SUSY in WW, WZ and WH hadronic final states

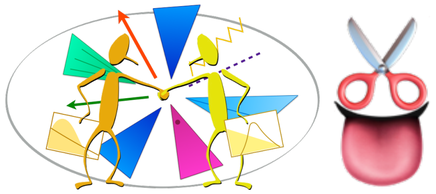
ADL for automated visualization - II

CMS-SUS-21-006: SUSY disappearing track analysis

analysis ADL file







To conclude

- ADL and CutLang present a multipurpose and practical analysis approach.
- ADL/CutLang highly suitable for reinterpretation studies.
- Analysis reimplementation / validation effort ongoing via SModelS EM-creator.
  - As usual, the main issue is the correct generation / simulation of the input samples.
- 2 complete CMS Open Data tutorials available, one featuring reinterpretation via optimization.
- AST-based analysis visualization tool adl2flowchart now available.
- Current and near-future focus areas:
  - Several full CMS analysis implementations for object and analysis preservation ongoing.
  - CMS 2016 analysis implementations for the newly-published 2016 NanoAOD open data planned targeting further examples for reinterpretation via optimization.
  - Further formal compiler / infrastructure developments ongoing.
- First ADL/CL-related developments targeted within OpenMAPP: HEPData interface, a more generic and robust interface to MC tools.

Extra slides

ADL syntax: main blocks, keywords, operators

Block purpose	Block keyword
object definition blocks	object
event selection blocks	region
analysis or ADL information	info
tabular information	table

Keyword purpose	Keyword
define variables, constants	define
select object or event	select
reject object or event	reject
define the mother object	take
apply weights	weight
bin events in regions	bin, bins
sort objects	sort
define histograms	histo
save variables for events	save

Operation	Operator
Comparison operators	> < => =< == != [] (include)][(exclude)
Mathematical operators	+ - * / ^
Logical operators	and or not
Ternary operator	condition ? truecase : falsecase
Optimization operators	~= (closest to) ~! (furthest from)
Lorentz vector addition	LV1 + LV2 LV1 LV2

Syntax also available to write existing analysis results (e.g. counts, errors, cutflows…).

Syntax develops further as we implement more and more analyses.

ADL syntax rules with usage examples: https://twiki.cern.ch/twiki/bin/view/LHCPhysics/ADL

ADL syntax: functions

Standard/internal functions: Sufficiently generic math and HEP operations could be a part of the language and any tool that interprets it.

- Math functions: abs(), sqrt(), sin(), cos(), tan(), log(), …
- Collection reducers: size(), sum(), min(), max(), any(), all(),…
- HEP-specific functions: dR(), dphi(), deta(), m(), ….
- Object and collection handling: union(), comb()…

External/user functions: Variables that cannot be expressed using the available operators or standard functions would be encapsulated in self-contained functions that would be addressed from the ADL file and accessible by compilers via a database.

- Variables with non-trivial algorithms: M_{T2}, aplanarity, razor variables, …
- Non-analytic variables: Object/trigger efficiencies, variables/efficiencies computed with ML, …

ADL syntax rules with usage examples: https://twiki.cern.ch/twiki/bin/view/LHCPhysics/ADL

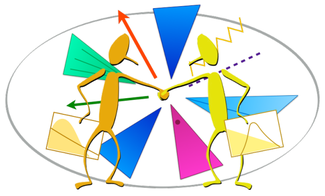
Histogramming and plotting tools

ADL/CL have extensive histogramming capabilities:

- 1D and 2D fixed bin and variable bin histograms defined with single line syntax.
- Histogram lists can be defined and reused in different regions and cut levels.
- Cutflow histograms and analysis bin histograms automatically drawn.

CutLang is enhanced with various easily configurable plotting tools based on standalone PyROOT or PyROOT in Jupyter notebooks (link).

- Shape comparisons between different processes.
- Weighted comparison between two processes (e.g. signal and background)
- Weighted full plotting including data, different backgrounds (stacked) and multiple signals (e.g. as in the previous page).



Versatile uses of ADL - I

- Analysis design (experimental or pheno):
  - Quick prototyping.
  - Simultaneous test of numerous selection options in a self-documenting way.
  - Easy comparison with existing analyses: *“Was my phase space already covered?”*
- Objects handling:
  - Easy reuse in new analyses.
  - Compare object definitions within or between analyses.
  - Compare definitions in different input data types.
- Analysis visualization:
  - Build analysis flow graphs and tables from analyses using static program analysis tools.
- Communication:
  - Between analysis team members (easy synchronization); with reviewers; between teams; between experiments or exp. and pheno.

Versatile uses of ADL - II

- Analysis preservation: Queryable databases for analysis logic and objects.
- Queries in analysis or object databases: Use static analysis tools to answer questions such as
  - *“Which analyses require MET > at least 300?”; “Which use b-jets tagged with criterion X? ”, “Which muons use isolation?”*
- Analysis comparisons / combinations:
  - Determine analysis overlaps, identify disjoint analyses or search regions;
  - Automate finding the combinations with maximal sensitivity; phase space fragmentation.
- Education:
  - Provide a learning database for students (and everyone).
  - Easy entry to running analyses (several schools & trainings organized).
- Reinterpretation: Next page.
- …

… and how would YOU use it?

ADL/CL for reinterpretation: Portable objects

Enables straightforward adaptation from experiments to public input event formats.

b-tagging for UL NanoAODv9

```
# b-tagged jets - medium
object MediumBTag
  take Jet
  select btagDeepB(Jet) >= 0.2783
```

b-tagging for public use, e.g. with Delphes

```
# b-tagged jets - medium
object MediumBTag
  take Jet
  select applyHM( btagdeepBmediumeff( pt(Jet), abs(eta(Jet)) )  == 1)
```

A generic function reading efficiencies, object attributes and applying the hit & miss method.

Efficiencies provided by CMS. ADL table blocks can host numerical efficiencies.

```
table btagdeepCSVmedium
  tabletype efficiency
  nvars 1
  errors true
  # eff      err-      err+      pTmin     pTmax
  0.5790     0.0016    0.0016    -10.4      30.0
  0.6314     0.0013    0.0013    30.0       35.0
  0.6442     0.0011    0.0011    35.0       40.0
  ...
```

- Repurpose ADL files: swap experimental object definition blocks with simplified object blocks based on numerical object ID / tagging efficiencies.
- Event selections stay almost the same: can swap trigger selections with trigger efficiencies

ADL/CL for reinterpretation: Object efficiencies

- Object efficiencies versus (multiple) attributes and their uncertainties provided by the experiments can be recorded in the ADL file via tables.
- CutLang can apply these efficiencies to input objects via the hit-and-miss method, for selecting objects with the efficiency probability.
  - both at object selection and event selection level.

```
object bjets
  take jets
  select abs(flavor(jets)) == 5
  select applyHM( btagdeepCSVmedium( Pt(jets) ) == 1)
```

```
table btagdeepCSVmedium
  tabletype efficiency
  nvars 1
  errors true
  # val    err-     err+       pTmin    pTmax
  0.5790   0.0016   0.0016    -10.4     30.0
