ISI	Alex Krizhevsky, Ilya Sutskever, Geoffrey Hinton	Our model is a large, deep convolutional neural network trained on raw RGB pixel values. The neural network, which has 60 million parameters and 650,000 neurons, consists of five convolutional layers, some of which are followed by max-pooling layers, and three globally-connected layers with a final 1000-way softmax. It was trained on two NVIDIA GPUs for about a week. To make training faster, we used non-saturating neurons and a very efficient GPU implementation of convolutional nets. To reduce overfitting in the globally-connected layers we employed hidden-unit "dropout", a recently-developed regularization method that proved to be very effective.

Abstract:

We discuss an evolutionary procedure for machine learning and present in detail an application of this procedure to the control of a robot TURTLE, which, beginning from a state of total ignorance, is able to develop the ability to circumnavigate a variety of obstacles. The procedure discussed is related to the strategy signature table method used in computer game playing.

# NEURAL NETWORKS AND CELLULAR AUTOMATA IN EXPERIMENTAL HIGH ENERGY PHYSICS

B. DENBY

*Laboratoire de l'Accélérateur Linéaire, Orsay, France*

Received 20 September 1987; in revised form 28 December 1987

Within the past few years, two novel computing techniques, cellular automata and neural networks, have shown considerable promise in the solution of problems of a very high degree of complexity, such as turbulent fluid flow, image processing, and pattern recognition. Many of the problems faced in experimental high energy physics are also of this nature. Track reconstruction in wire chambers and cluster finding in cellular calorimeters, for instance, involve pattern recognition and high combinatorial complexity since many combinations of hits or cells must be considered in order to arrive at the final tracks or clusters. Here we examine in what way connective network methods can be applied to some of the problems of experimental high energy physics. It is found that such problems as track and cluster finding adapt naturally to these approaches. When large scale hard-wired connective networks become available, it will be possible to realize solutions to such problems in a fraction of the time required by traditional methods. For certain types of problems, faster solutions are already possible using model networks implemented on vector or other massively parallel machines. It should also be possible, using existing technology, to build simplified networks that will allow detailed reconstructed event information to be used in fast trigger decisions.

# NEURAL NETWORKS AND CELLULAR AUTOMATA IN EXPERIMENTAL HIGH ENERGY PHYSICS

B. DENBY

*Laboratoire de l'Accélérateur Linéaire, Orsay, France*

Received 20 September 1987; in revised form 28 December 1987

Within the past few years, two **novel computing techniques** have shown considerable promise in the solution of problems of a very high speed of processing, and pattern recognition. Many of the problems faced in experimental high energy physics are of this nature. Track reconstruction in wire chambers and cluster finding in cell detectors are examples of high combinatorial complexity since many combinations of hits are possible. Here we examine in what way connective networks can be used in experimental high energy physics. It is found that such problems can be solved in **a fraction of the time required by traditional methods**, and that it is possible using model networks implemented on vector or other **modern** existing technology, to build simplified networks that will allow **fast** trigger decisions.

## What's in the article?

- Introduces **neural networks** to the HEP community for the first time
  - **Simple units** sum their inputs & apply an **activation function**
  - Outputs connect to other inputs via **weights**, and
  - **Perform a useful task** by mapping from inputs to outputs
- Proposes a recurrent neural network **algorithm** for **track finding** (*Denby-Peterson algorithm*)
- Highlights the **parallel nature** of calculating with neural networks and its interest for experimental **triggers**
- Also discusses **feed-forward neural networks** for **template matching**, and the possibility of using **learning**

## Nobelpriset i fysik 2013

Kungl. Vetenskapsakademien har beslutat utdela Nobelpriset i fysik 2013 till

**François Englert**

Université Libre de Bruxelles, Bryssel, Belgien

**Peter W. Higgs**

University of Edinburgh, Storbritannien

”för den teoretiska upptäckten av en mekanism som bidrar till förståelsen av massans ursprung hos subatomära partiklar, och som nyligen, genom upptäckten av den förutsagda fundamentala partikeln, bekräftats av ATLAS- och CMS-experimenten vid CERN:s accelerator LHC”

### Äntligen här!

**François Englert och Peter W. Higgs delar årets Nobelpris i fysik för teorin om hur partiklar får sin massa. Oberoende av varandra föreslog de teorin samtidigt år 1964 (Englert tillsammans med sin numera avlidne kollega Robert Brout). Först 2012 bekräftades deras idéer genom upptäckten av en så kallad Higgspartikel vid CERN-laboratoriet utanför Genève i Schweiz.**

Den i år prisbelönta teorin är en central del i fysikens standardmodell som beskriver hur världen är uppbyggd. Allting, från blommor och människor till stjärnor och planeter, består enligt standardmodellen av några få byggstenar, *materiepartiklar*. Dessa partiklar styrs av krafter som förmedlas av *kraftpartiklar* som ser till att allt fungerar som det ska.

Hela standardmodellen vilar på att det också finns en särskilt sorts partikel, Higgspartikeln. Denna är en vibration av ett osynligt fält som fyller rymden. Till och med när universum verkar tomt på allt, finns fältet där. Utan det skulle vi inte finnas, för det är genom kontakten med fältet som partiklarna får sin massa. Den av Englert och Higgs föreslagna teorin beskriver hur detta går till.

Den 4 juli 2012 bekräftades teorin i och med upptäckten av Higgspartikeln vid CERN:s accelerator LHC.

partikelkolliderare, LHC (Large Hadron Collider), är troligen den största och mest komplicerade maskin som någonsin byggts av människor. Ur miljarder partikelkrokar i LHC lyckades två grupper, ATLAS och CMS, med cirka 3 000 forskare var, vaska fram Higgspartikeln.

Även om det är ett storverk att finna Higgspartikeln, den sista pusselbiten som fattades i standardmodellen, så är standardmodellen inte den sista biten i pusslet om hela universum. Ett av skälen är att vissa partiklar, neutriner, beskrivs i standardmodellen som masslösa, medan ny forskning pekar mot att de faktiskt har massa. Ett annat skäl är att modellen bara omfattar den synliga materien, vilken endast är en femtedel av all materia som finns i världsalldet. Att hitta den mystiska mörka materien är ett av målen för den fortsatta jakten på okända partiklar vid CERN.

**François Englert**, belgisk medborgare. Född 1932 (80 år) i Etterbeek, Belgien. Fil.dr 1959 vid Université Libre de Bruxelles, Bryssel, Belgien. Professor emeritus vid Université Libre de Bruxelles, Bryssel, Belgien.  
[www.ulb.ac.be/sciences/phys/peopel\\_FEnglert.html](http://www.ulb.ac.be/sciences/phys/peopel_FEnglert.html)

**Peter W. Higgs**, brittisk medborgare. Född 1929 (84 år) i Newcastle upon Tyne, Storbritannien. Fil.dr 1954 vid King's College, University of London, Storbritannien. Professor emeritus vid University of Edinburgh, Storbritannien.

**0(1) trillion  
simulated events**

**278 petabytes of data  
(Netflix 24/7 for more than 15,000 years)**

**We had to collide billions of protons,  
only around 10 signal events were needed to claim discovery!**

**We had to collide billions of protons,  
only around 10 signal events were needed to claim discovery!**

We have a lot of high quality simulated data that we want to use to train AI algorithms!

But we have even more unlabelled data we'd like to use!

Supervised versus unsupervised

Point Cloud: Set of  $N$ -dimensional vectors  
(e.g. set of particles and their 4-momentum)

SOTA: Graph Neural Networks acting on point cloud data

- [ParticleNet](#) (GNN on point cloud)
- [LundNet](#) (GNN, Lund plane)
- [ABCNet](#) (GNN, attention)
- [Point Cloud Transformers](#) (transformer, attention)
- [ParticleNeXt](#) (GNN, attention, Lund)
- [ParT](#) (transformer, attention)

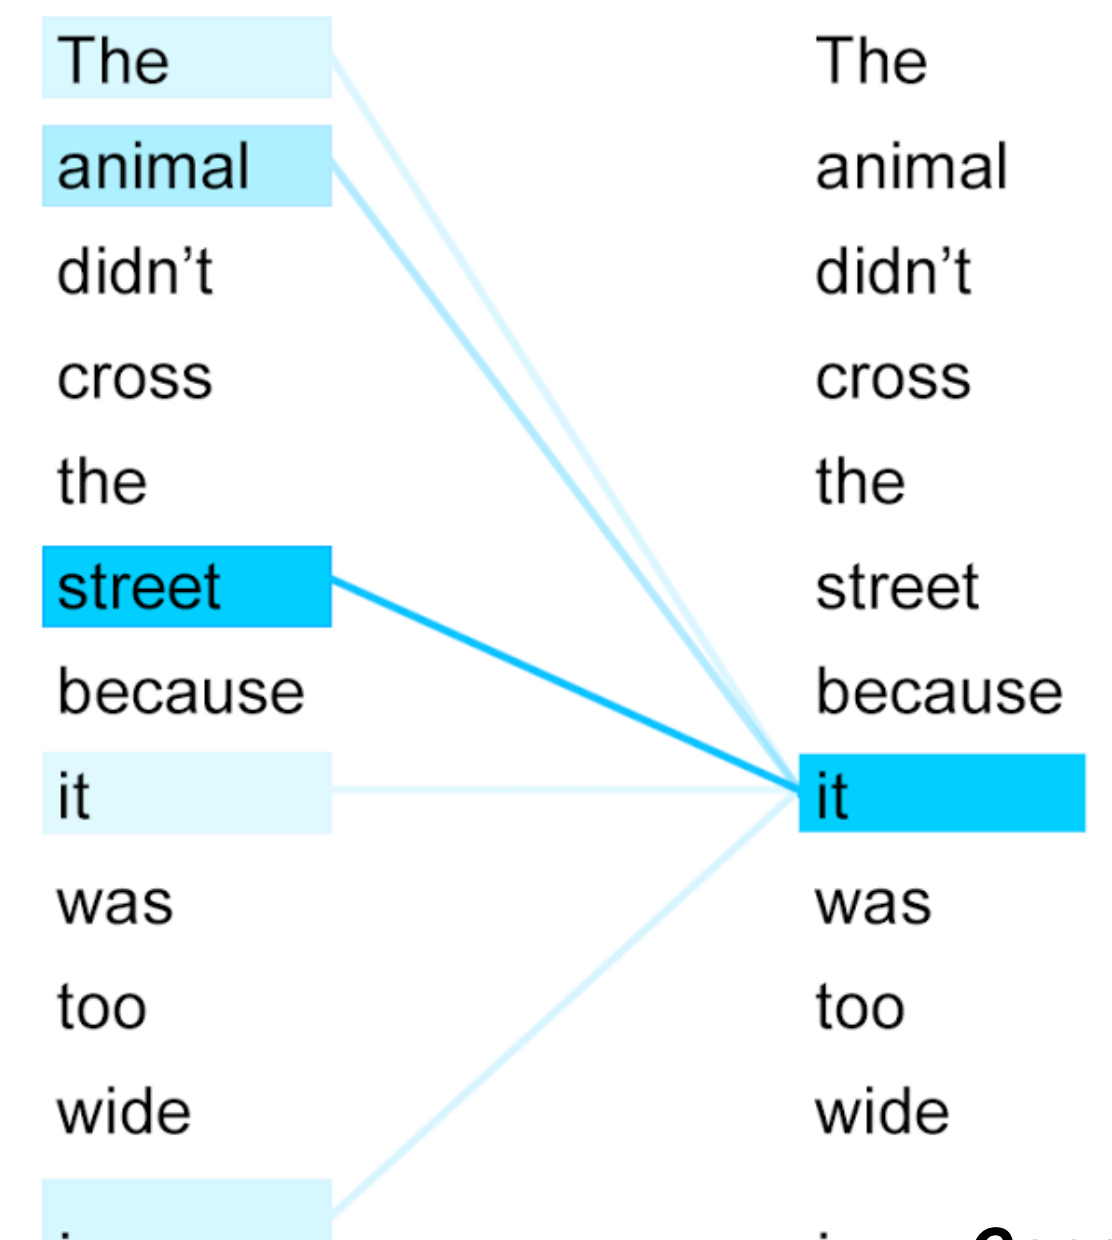

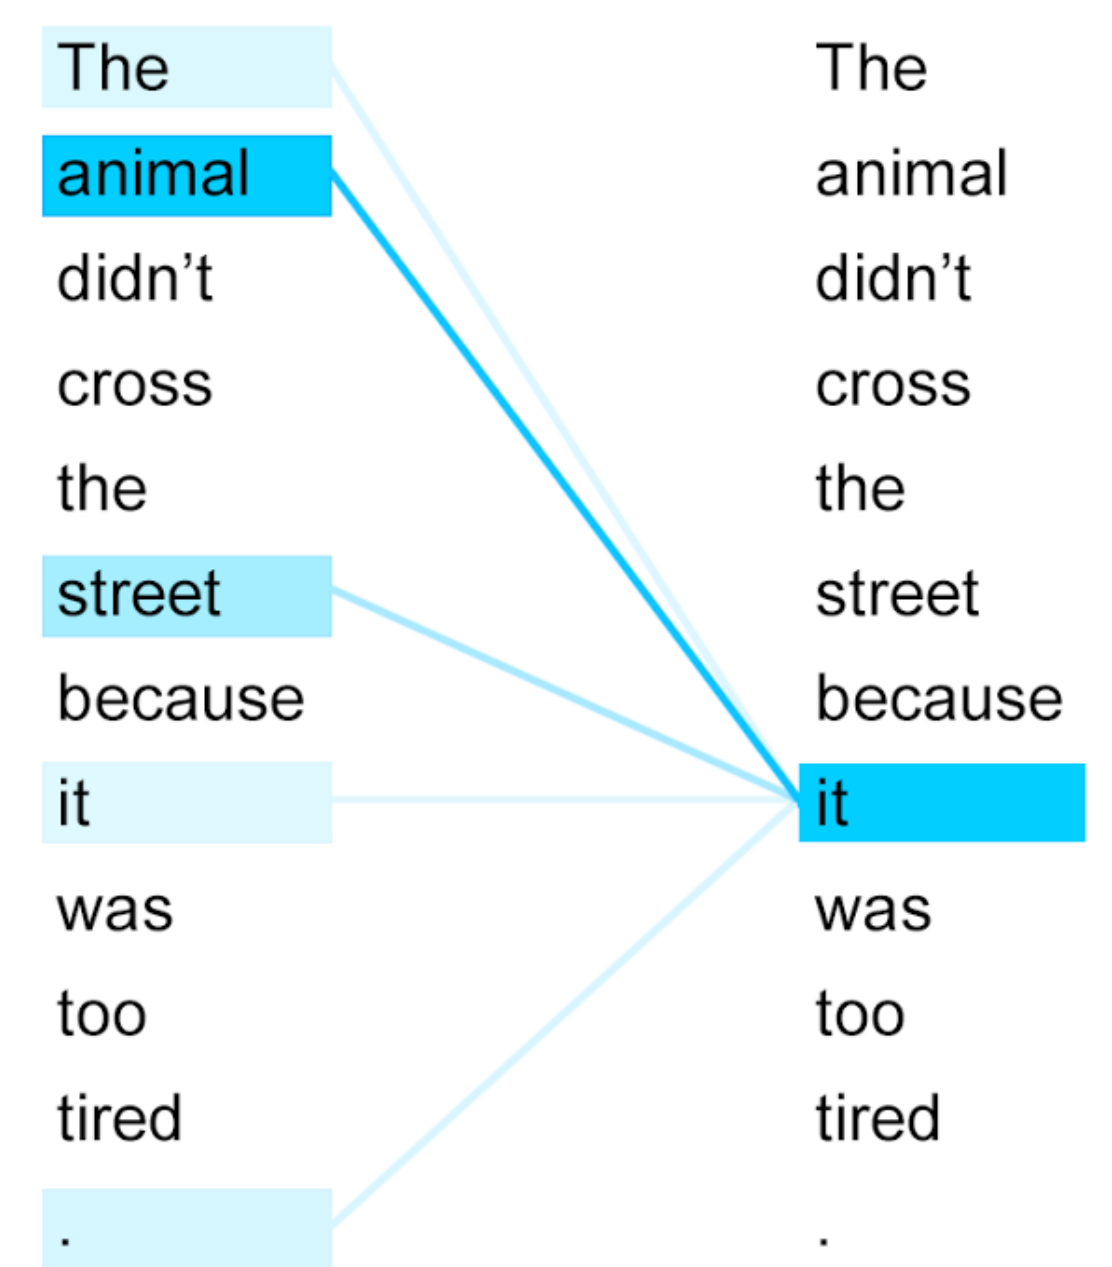

# Transformers and (self-)attention

---

## Adding (Self-)Attention

- Allows particles to interact with each other (“self”) and find out which other particles they should pay more attention to (“attention”)

# Transformers and (self-)attention

## Adding (Self-)Attention

- Allows particles to interact with each other (“self”) and find out which other particles they should pay more attention to (“attention”)

Weighted sum over all input vectors:

$$\mathbf{y}_i = \sum_j w_{ij} \mathbf{x}_j$$

Weight (how related inputs are):

$$w'_{ij} = \mathbf{x}_i^T \mathbf{x}_j$$

$x_j \rightarrow \text{MLP}(x_j)$   
 $x_i \rightarrow \text{MLP}(x_i)$

Map to [0,1]:

$$w_{ij} = \frac{\exp w'_{ij}}{\sum_j \exp w'_{ij}}$$

# Transformers and (self-)attention

## Adding (Self-)Attention

- Allows particles to interact with each other (“self”) and find out which other particles they should pay more attention to (“attention”)

## Attention weights: weighted importance between each pair of particles

- Determine relationship between all particles of point cloud
- Several attention layers → different important features (multi-head attention)

Weighted sum over all input vectors:

$$\mathbf{y}_i = \sum_j w_{ij} \mathbf{x}_j$$

Weight (how related inputs are):

$$w'_{ij} = \mathbf{x}_i^T \mathbf{x}_j$$

$$\begin{array}{l} \mathbf{x}_j \rightarrow \text{MLP}(\mathbf{x}_j) \\ \mathbf{x}_i \rightarrow \text{MLP}(\mathbf{x}_i) \end{array}$$

Map to [0,1]:

$$w_{ij} = \frac{\exp w'_{ij}}{\sum_j \exp w'_{ij}}$$

**ABCNet:**

**Pixel intensity = particle importance w.r.t most energetic particle in jet, from attention weights**  
**Learned through attention!**

2024 - Transfer learning from larger dataset

 Energy deposits → digital signals → reconstructed by the reconstruction software [Hard & Slow]

## Data analysis

# Train on simulation, test on data

If data and simulation differ, this is sub-optimal!

# Bias in particle physics

Searches at LHC always start by

- assuming **Standard Model** and some **signal hypothesis**

This is fine when we know what “signal” is (like Higgs)

- **Tailor search** to a given theory
- Powerful, but **limited to model of choice**

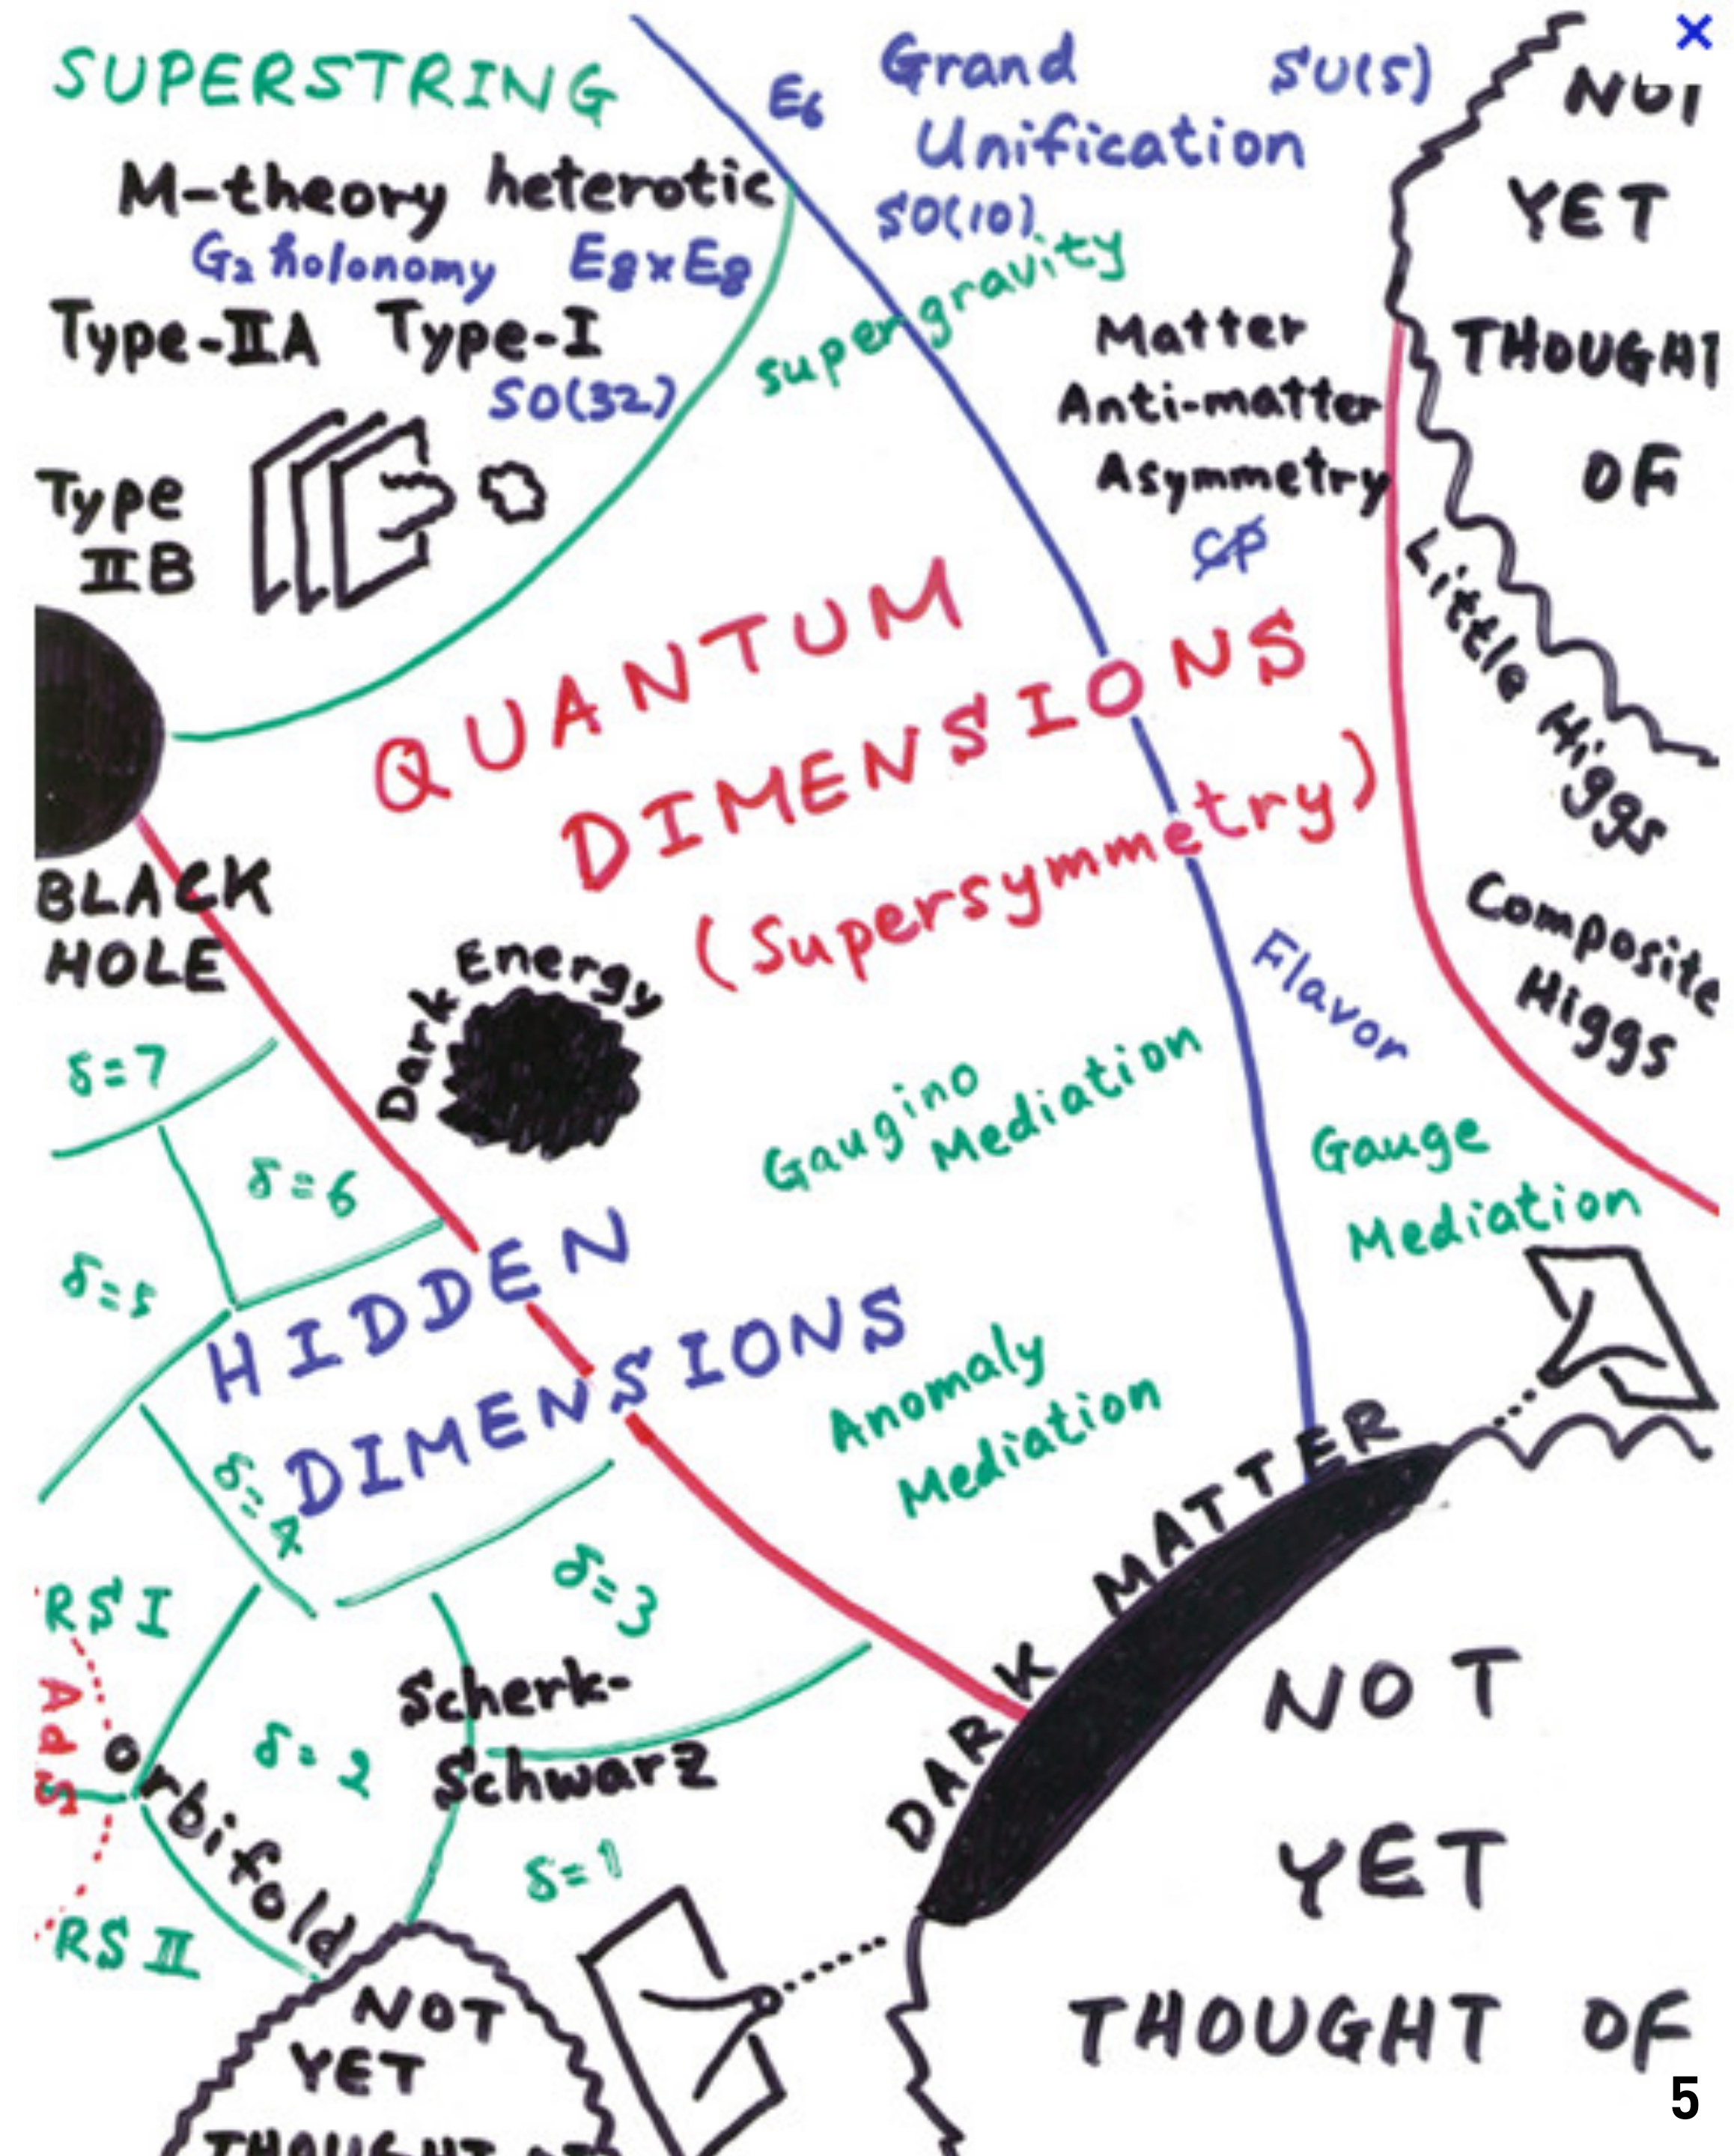

# Bias in particle physics

Searches at LHC always start by

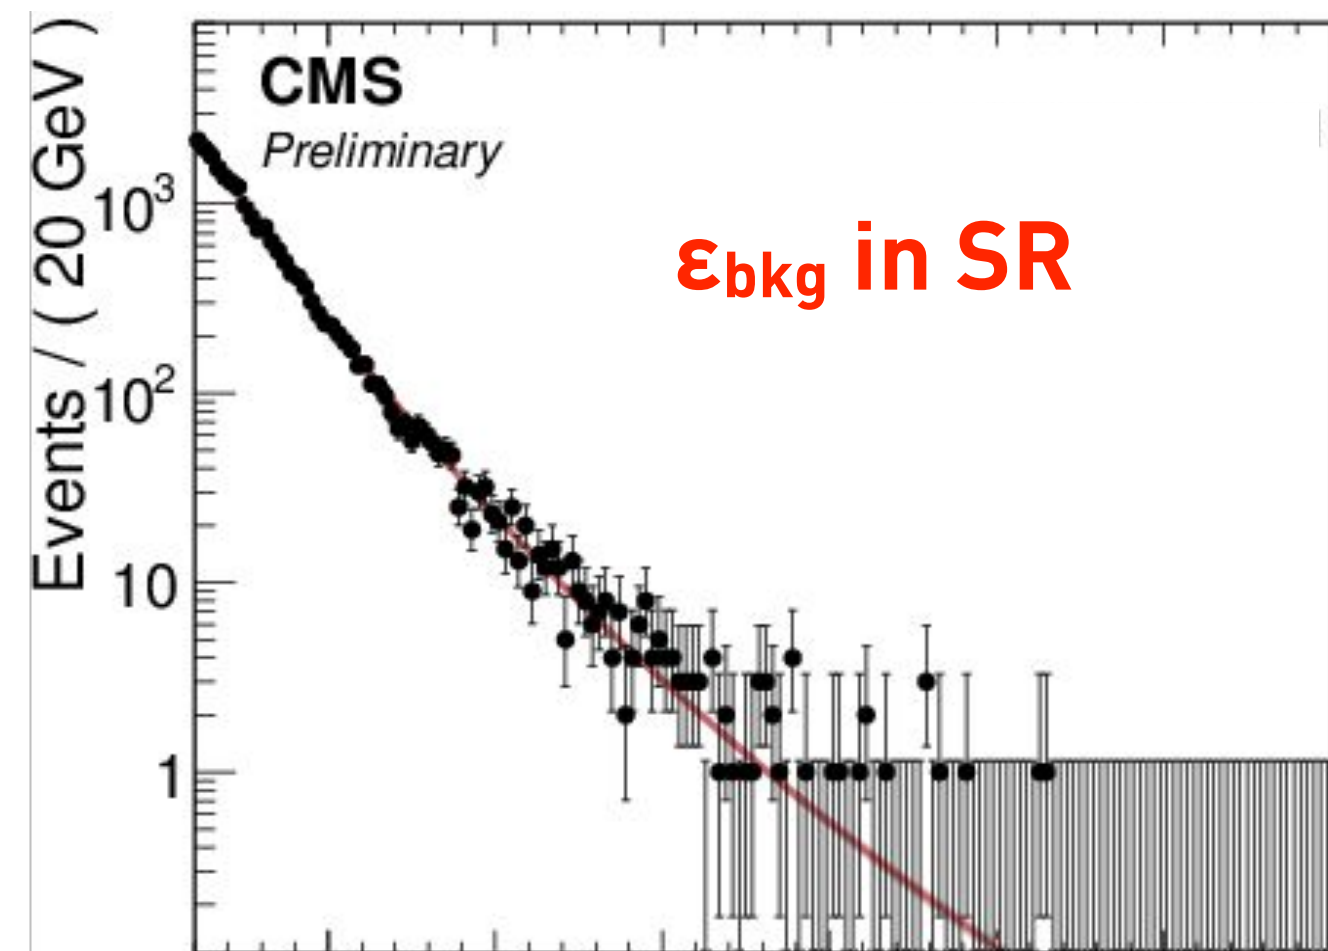

- assuming **Standard Model** and some **signal hypothesis**

This is fine when we know what “signal” is (like Higgs)

- **Tailor search** to a given theory
- Powerful, but **limited to model of choice**
  
- How do we know we are looking for the right thing in the enormous New Physics model landscape?

# Anomaly detection for New Physics searches

Can we reduce

this

# Anomaly detection for New Physics searches

Can we reduce  
**this**  
 and maximise  
**this**

# Anomaly detection for New Physics searches

Can we reduce **this** and maximise **this** to probe hundreds of signal hypotheses all at once?  
 \*(Maybe also some we didn't think of yet?)

# Anomaly detection for New Physics searches

Not interesting region

Standard Model  
(simulated events)

Interesting region

Signal hypothesis  
(simulated events)

# Anomaly detection for New Physics searches

LEARN THIS FROM  
DATA

LOOK FOR ANYTHING  
THAT DOESNT LOOK  
LIKE THIS

# Types of anomaly detection

## Outlier detection

Find (non-resonant) out-of-distribution datapoints

## Detecting overdensities

Find (resonant) overdensities in distributions

# Outlier detection

Compressed representation of  $x$ .  
Latent space  $\mathcal{R}^k$ ,  $k < m \times n$   
prevents memorisation of input, must learn

# Outlier detection

$\mathcal{L}(\mathbf{x}, \hat{\mathbf{x}})$  is Mean Squared Error( $\mathbf{x}, \hat{\mathbf{x}}$ ), "high error events" proxy for "degree of abnormality"

# Outlier detection in analysis

# CMS High Granularity calorimeter

- 6.5 million readout channels, 50 layers

VBF H ( $\gamma\gamma$ )

VBF H ( $\gamma\gamma$ )

No timing cut

90 ps time window

VBF H ( $\gamma\gamma$ )

**BUT: Cannot read out all these channels fast enough for L1 to trigger!**

window

### Compress data ON the detector

- ASICs reduce + transmit data
  - 40 MHz trigger data
  - 750 kHz DAQ data
- High radiation
- Cooled to -30 → low power (Max 500 mW total)
- 1.5  $\mu$ s latency

# Variational Autoencoder

***AEs for compression also at LHCb!***

***AEs for compression also at LHCb!***

- 75-100 mW
- Triplicated w/b for radiation safety
- Reprogrammable w/b over IC2!

***AEs for compression also at LHCb!***

On ASIC

Encoded data

Transmit encoded data!

Encoded data

# Anomaly Detection triggers

Level-1 rejects >99% of events!  
Is there a smarter way to select?

# Anomaly Detection triggers

# Outlier detection

Compressed representation of  $\mathbf{x}$ .  
Latent space  $\mathcal{R}^k$ ,  $k < m \times n$   
prevents memorisation of input, must learn

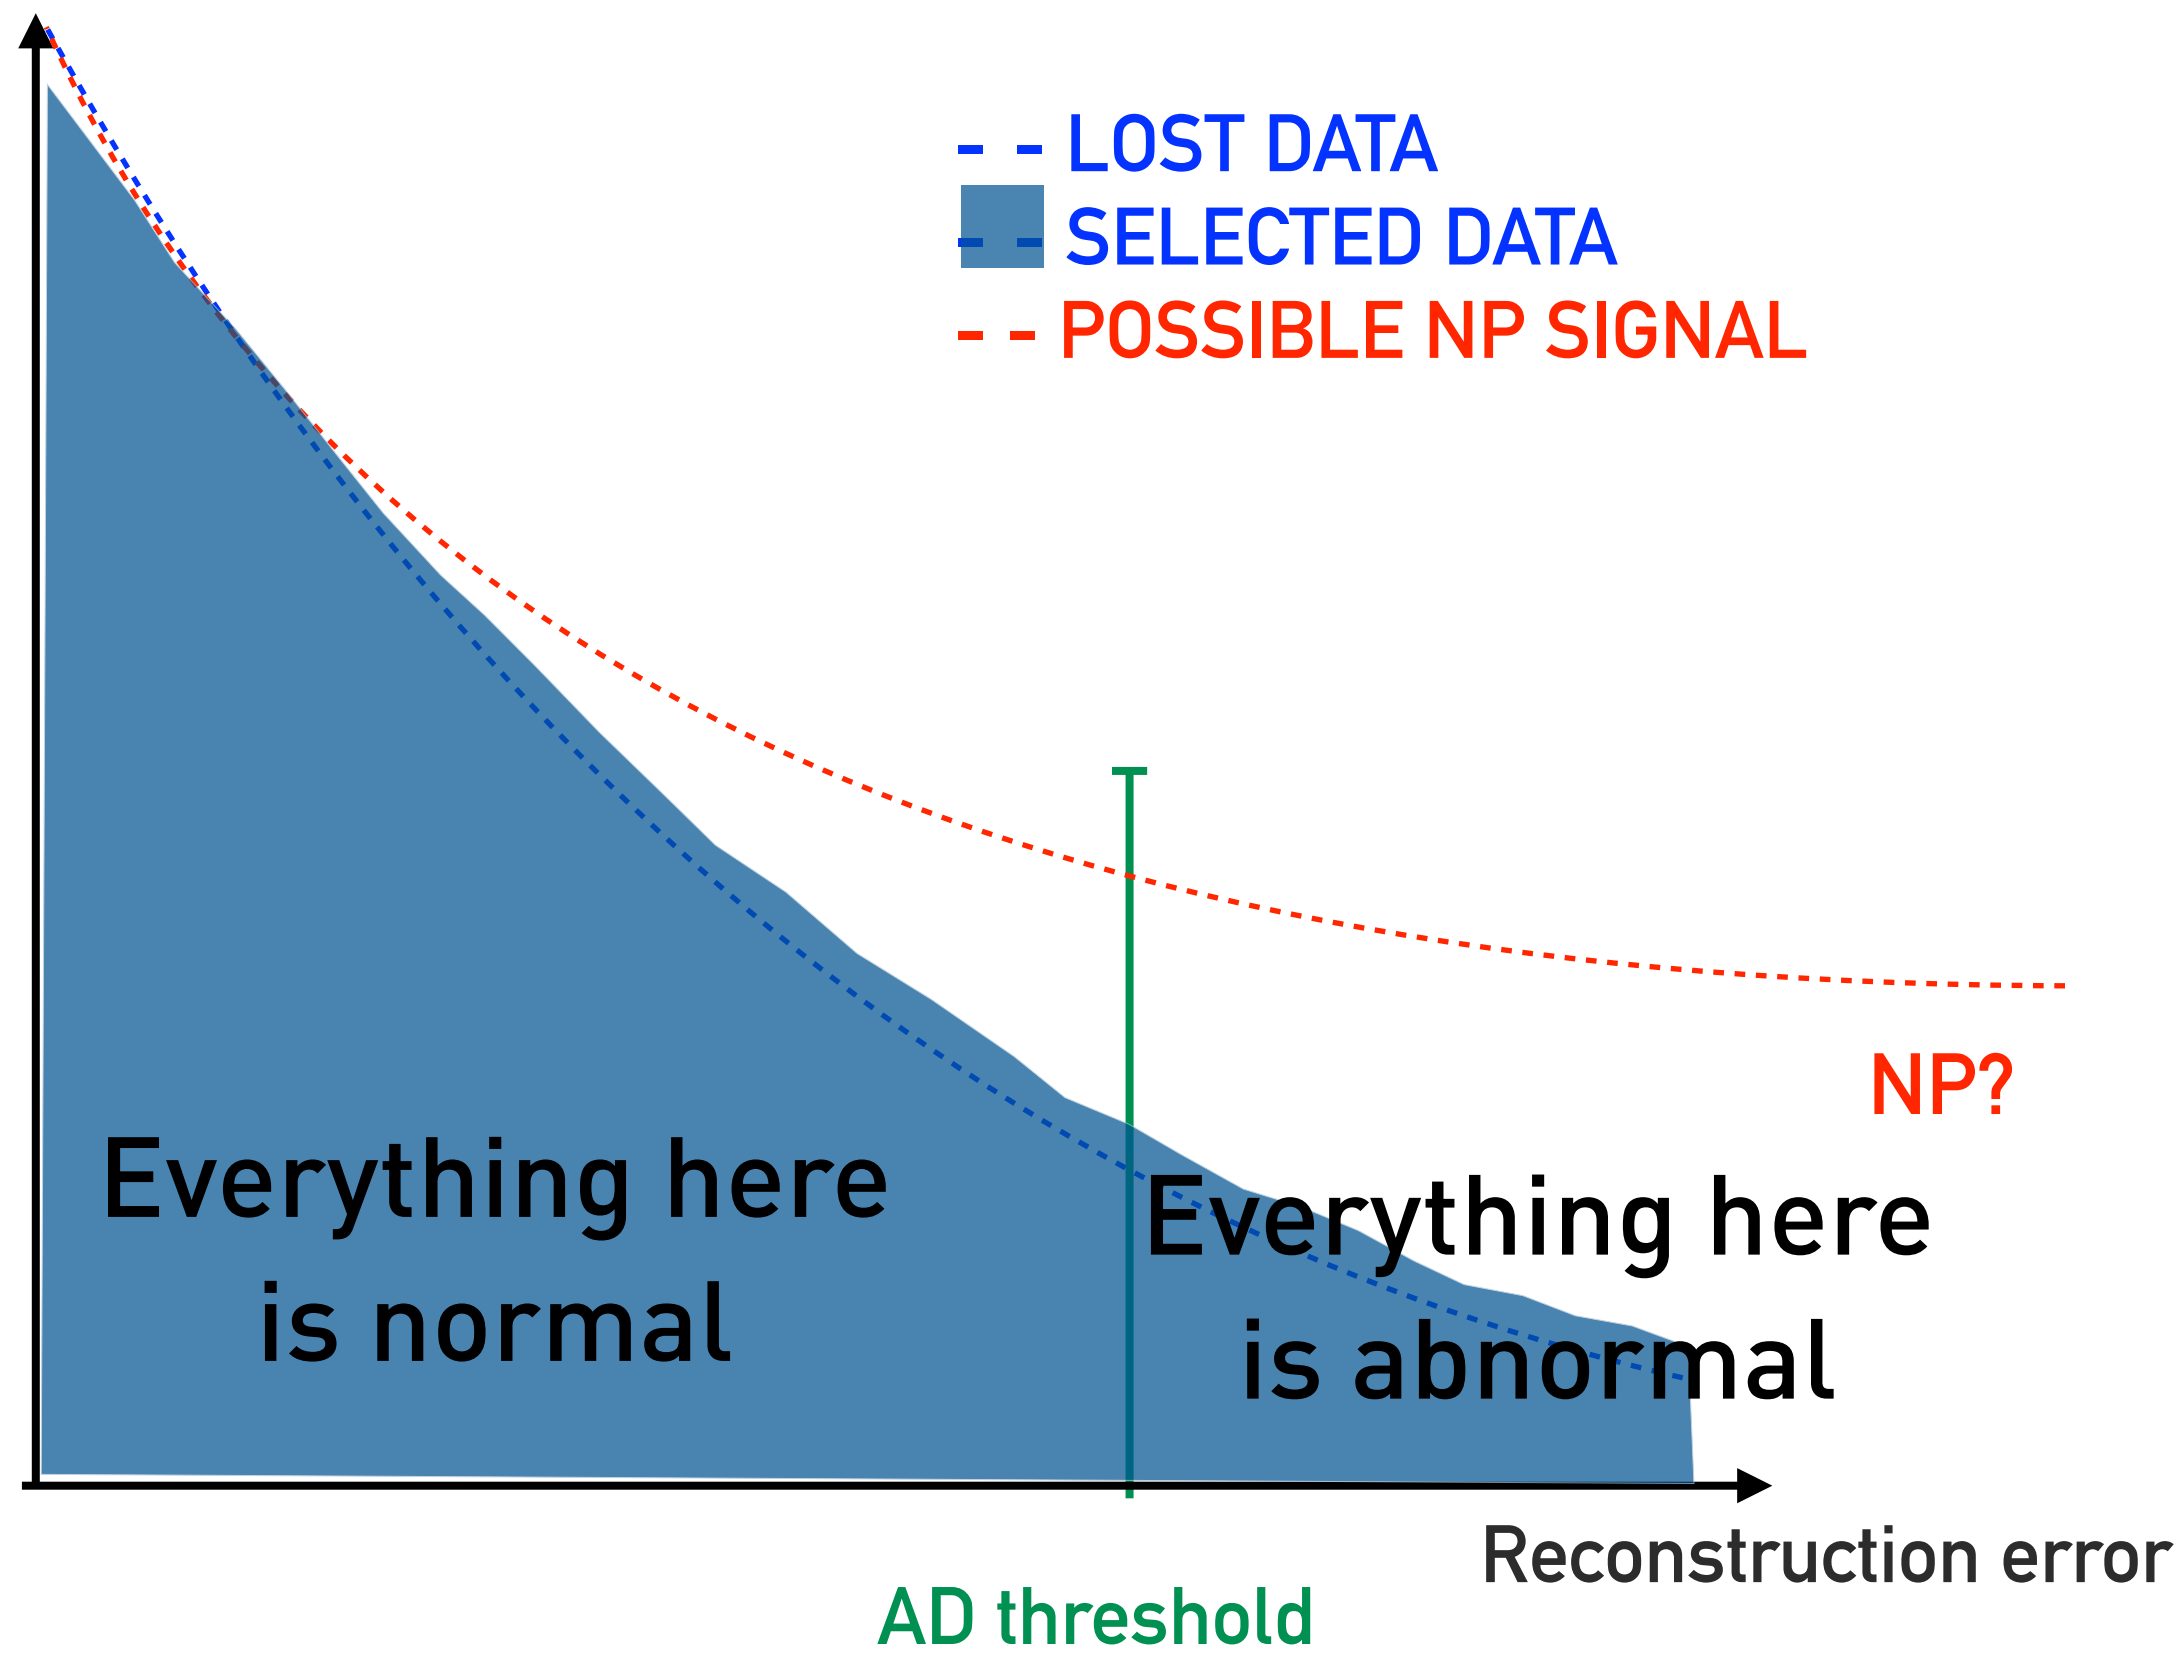

# Outlier detection

$\mathcal{L}(\mathbf{x}, \hat{\mathbf{x}})$  is Mean Squared Error( $\mathbf{x}, \hat{\mathbf{x}}$ ), "high error events" proxy for "degree of abnormality"

# Outlier detection

....in 50 nanoseconds!  
 Currently recording 300 collisions per second in CMS!

# First ML triggers in ATLAS and in CMS in 2024

0/1?

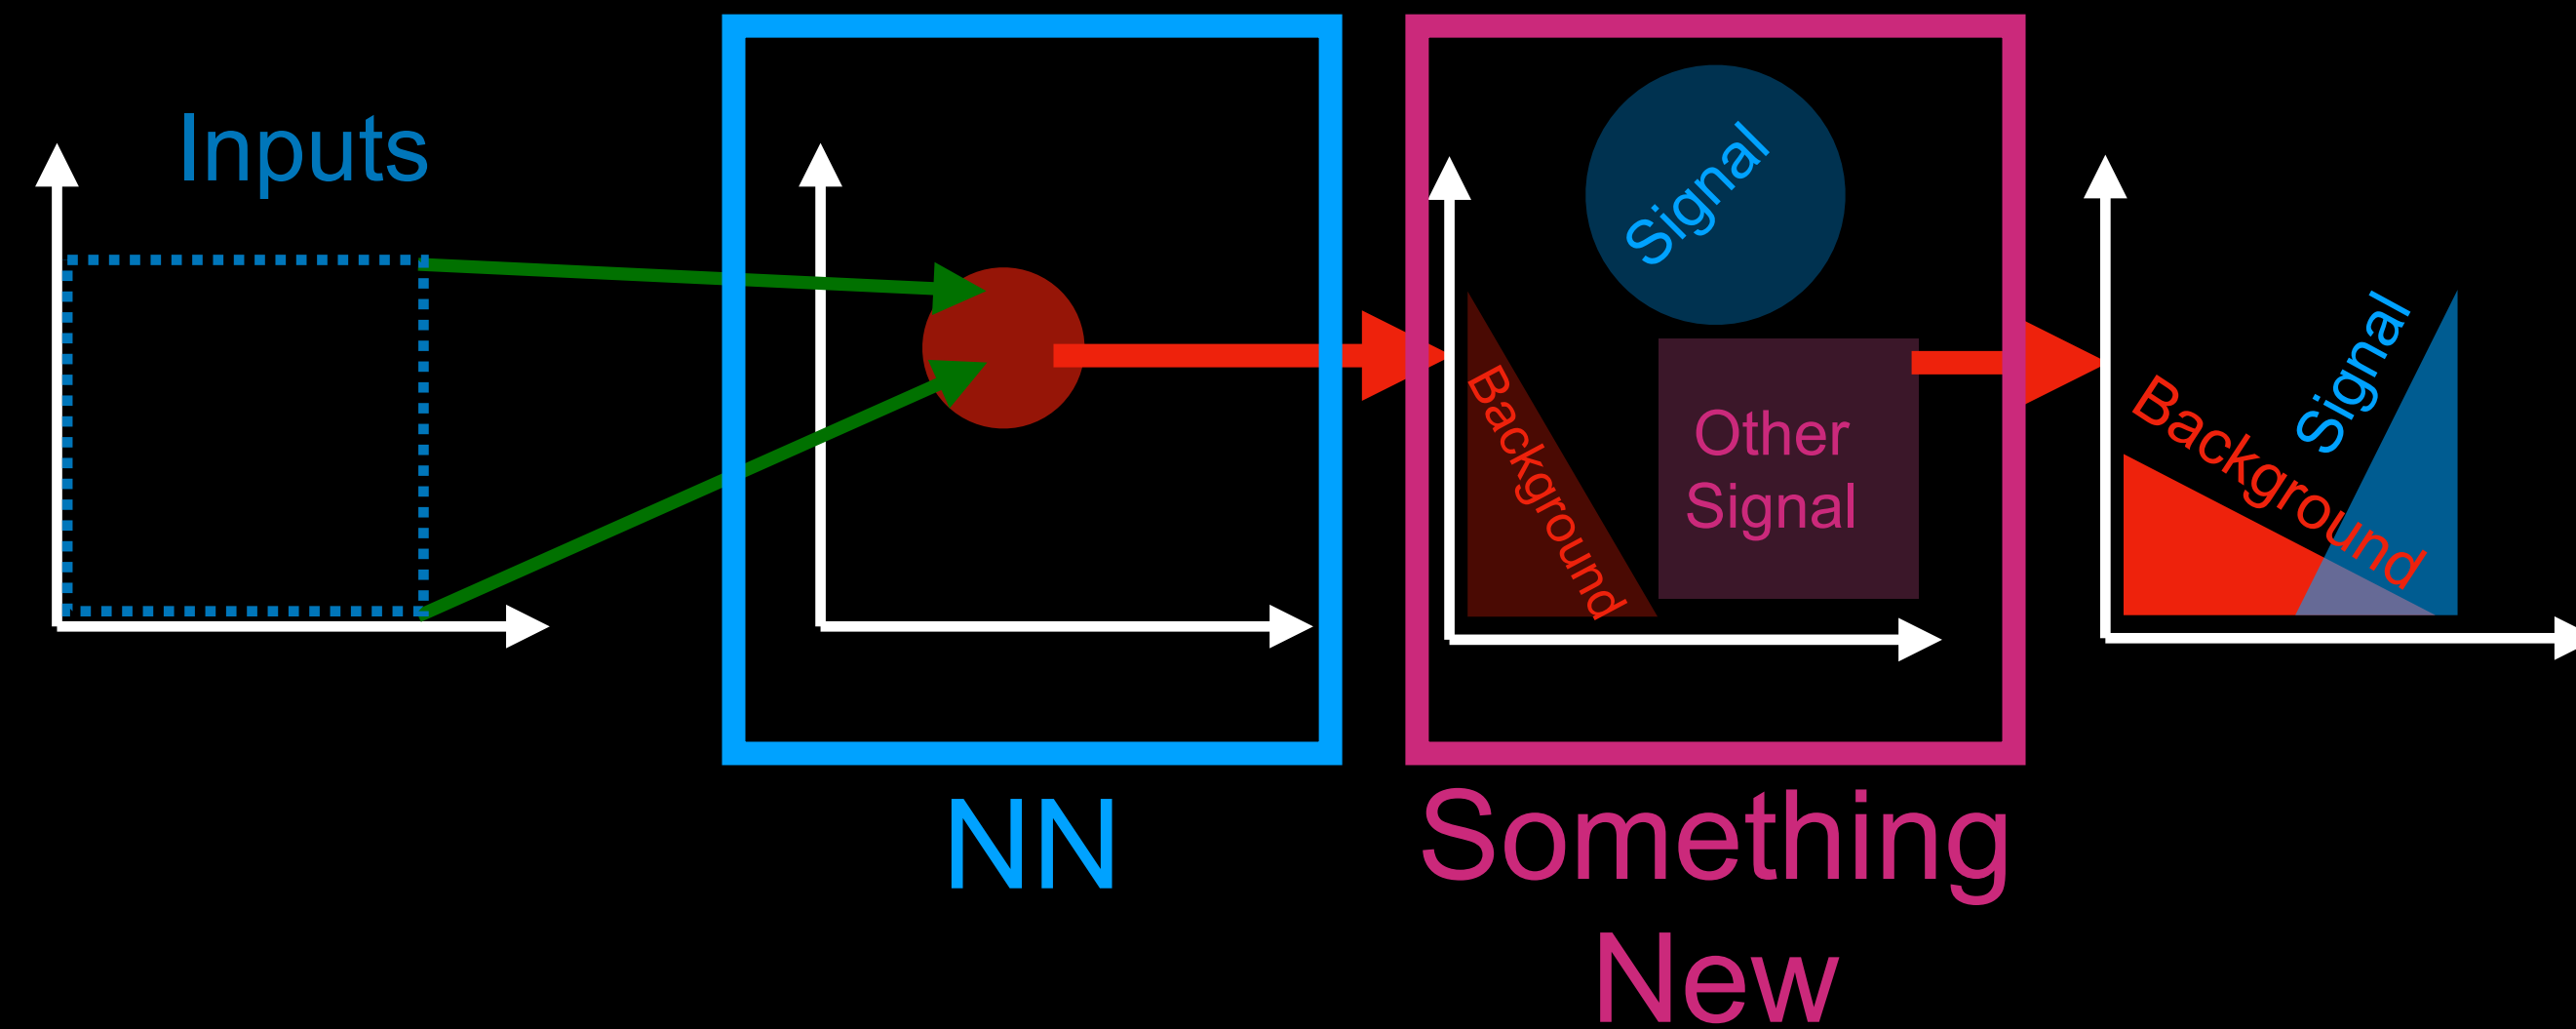

Generate simulation?

# Too many models, too little learning?

## Discrimination

Instead of features like “says meow”, can we make new and better features?

**Metric Learning**

What if we really try to focus on this space

**Neural embedding**

# Learning the space

# Learning the space

- By looking at data, we can learn a lot
  - Go over input piece by piece
  - Analyze every aspect
  - Compare every feature
- Find distinctive style of the input
  - can be done e.g by looking for a deviation

# Contrastive learning (self-supervised)

# Maximize

Cat A

Dog A

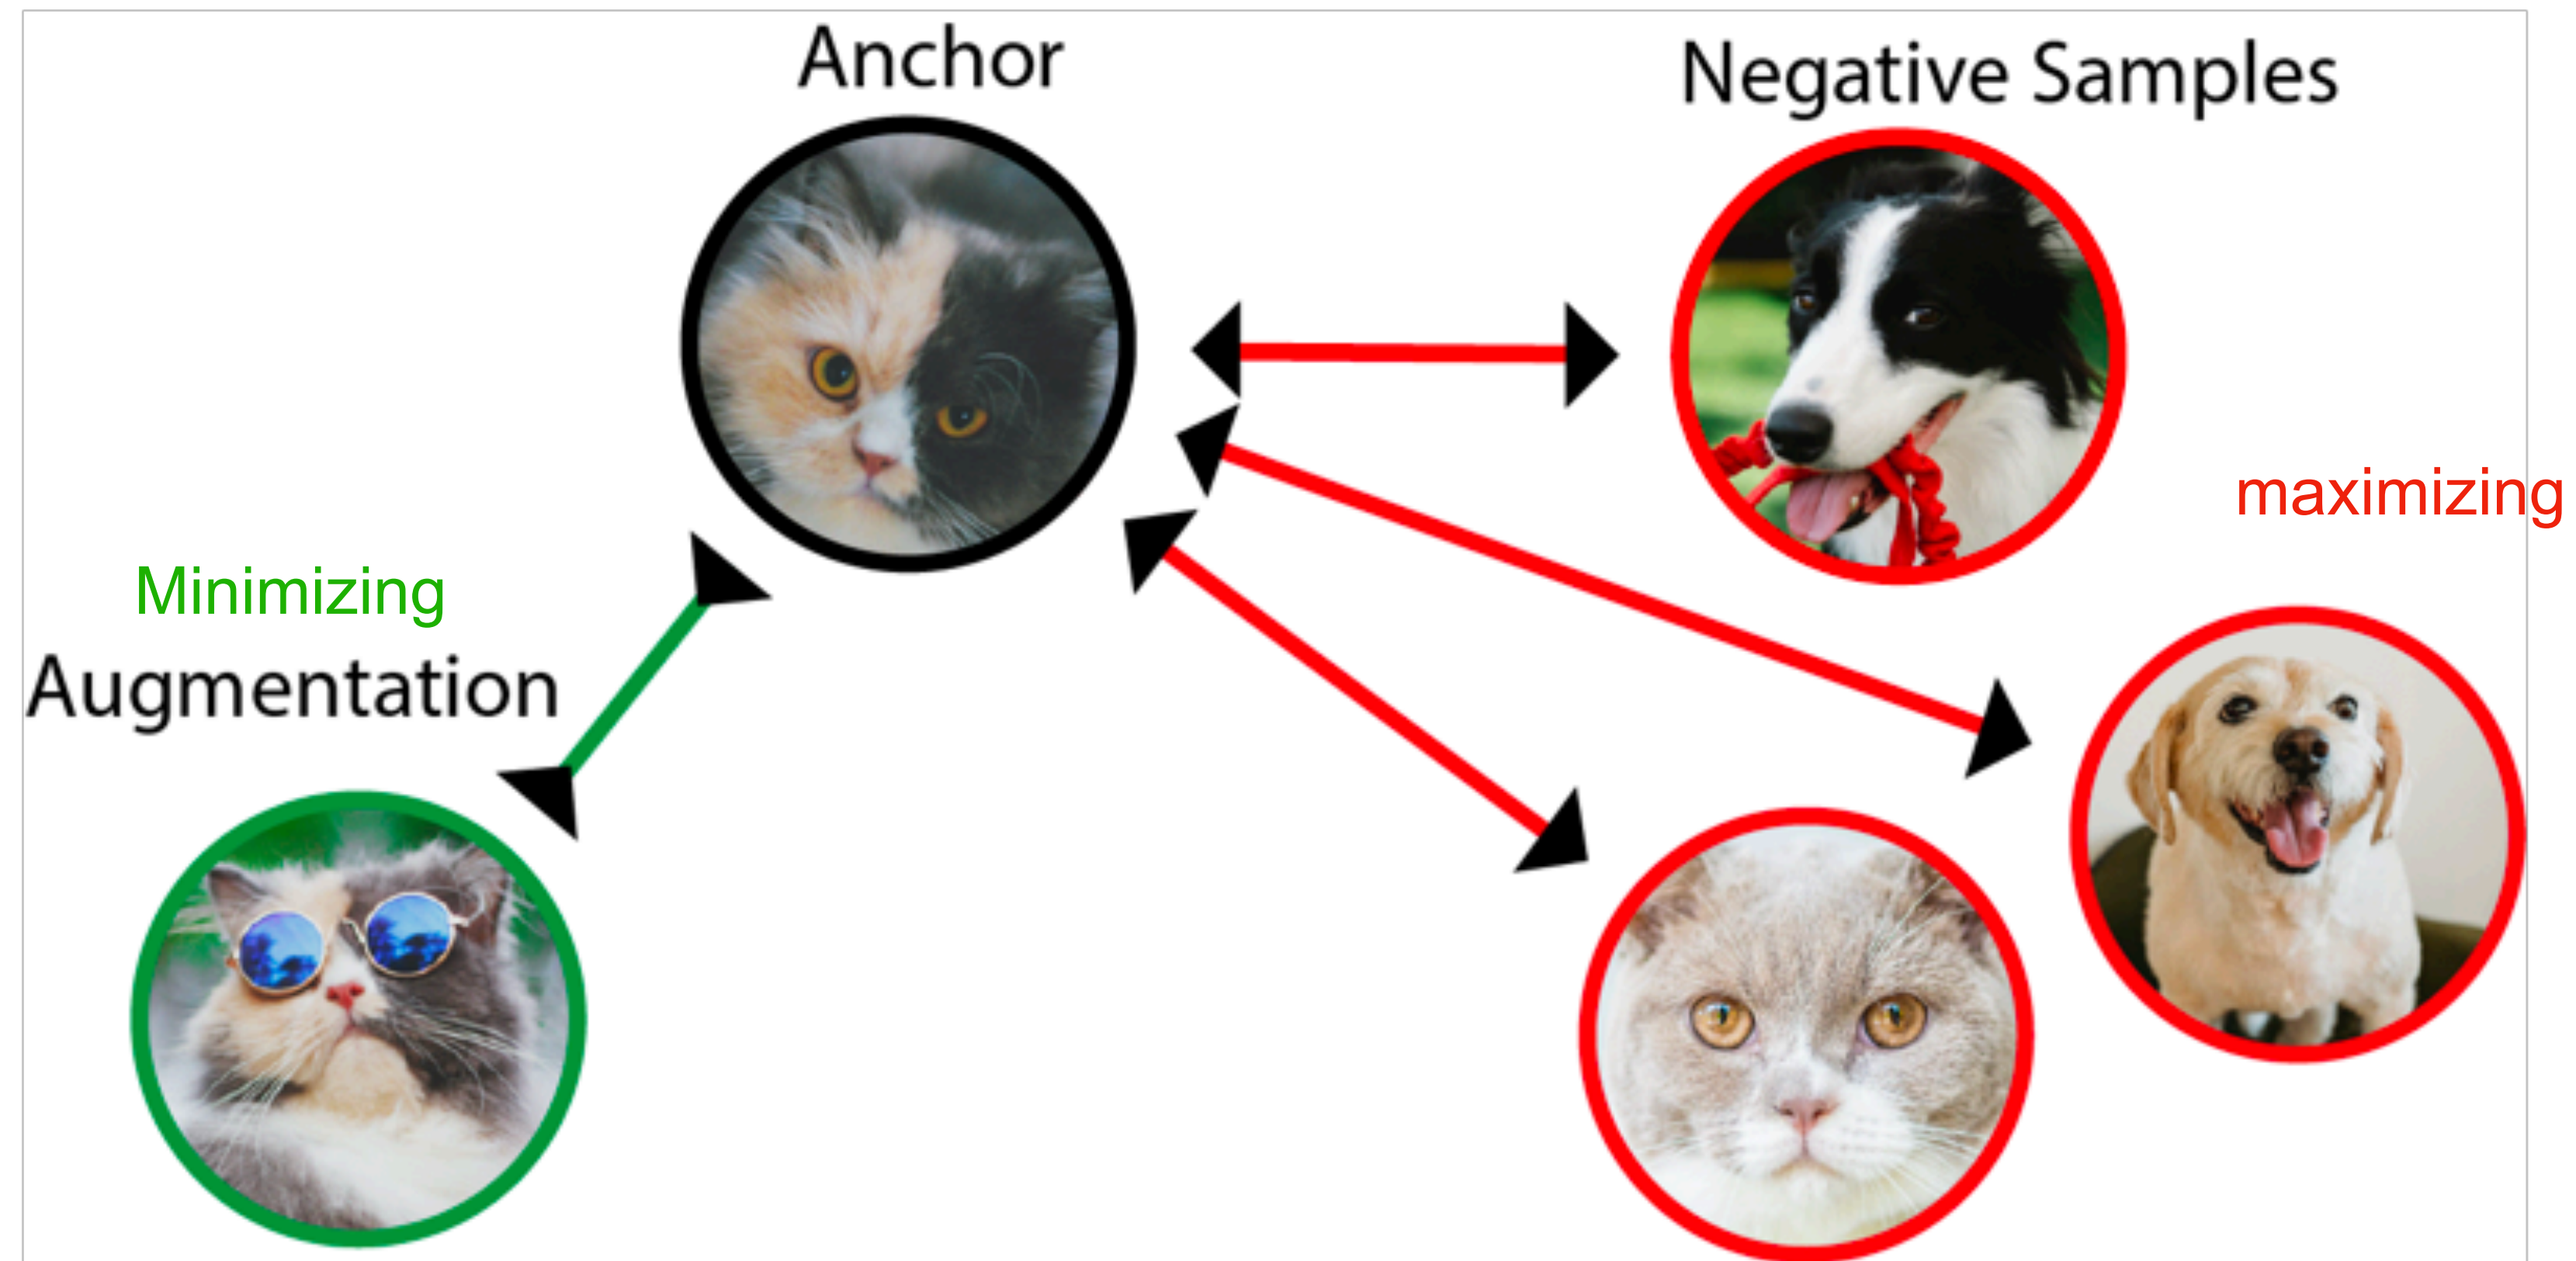

Augmented Cat A

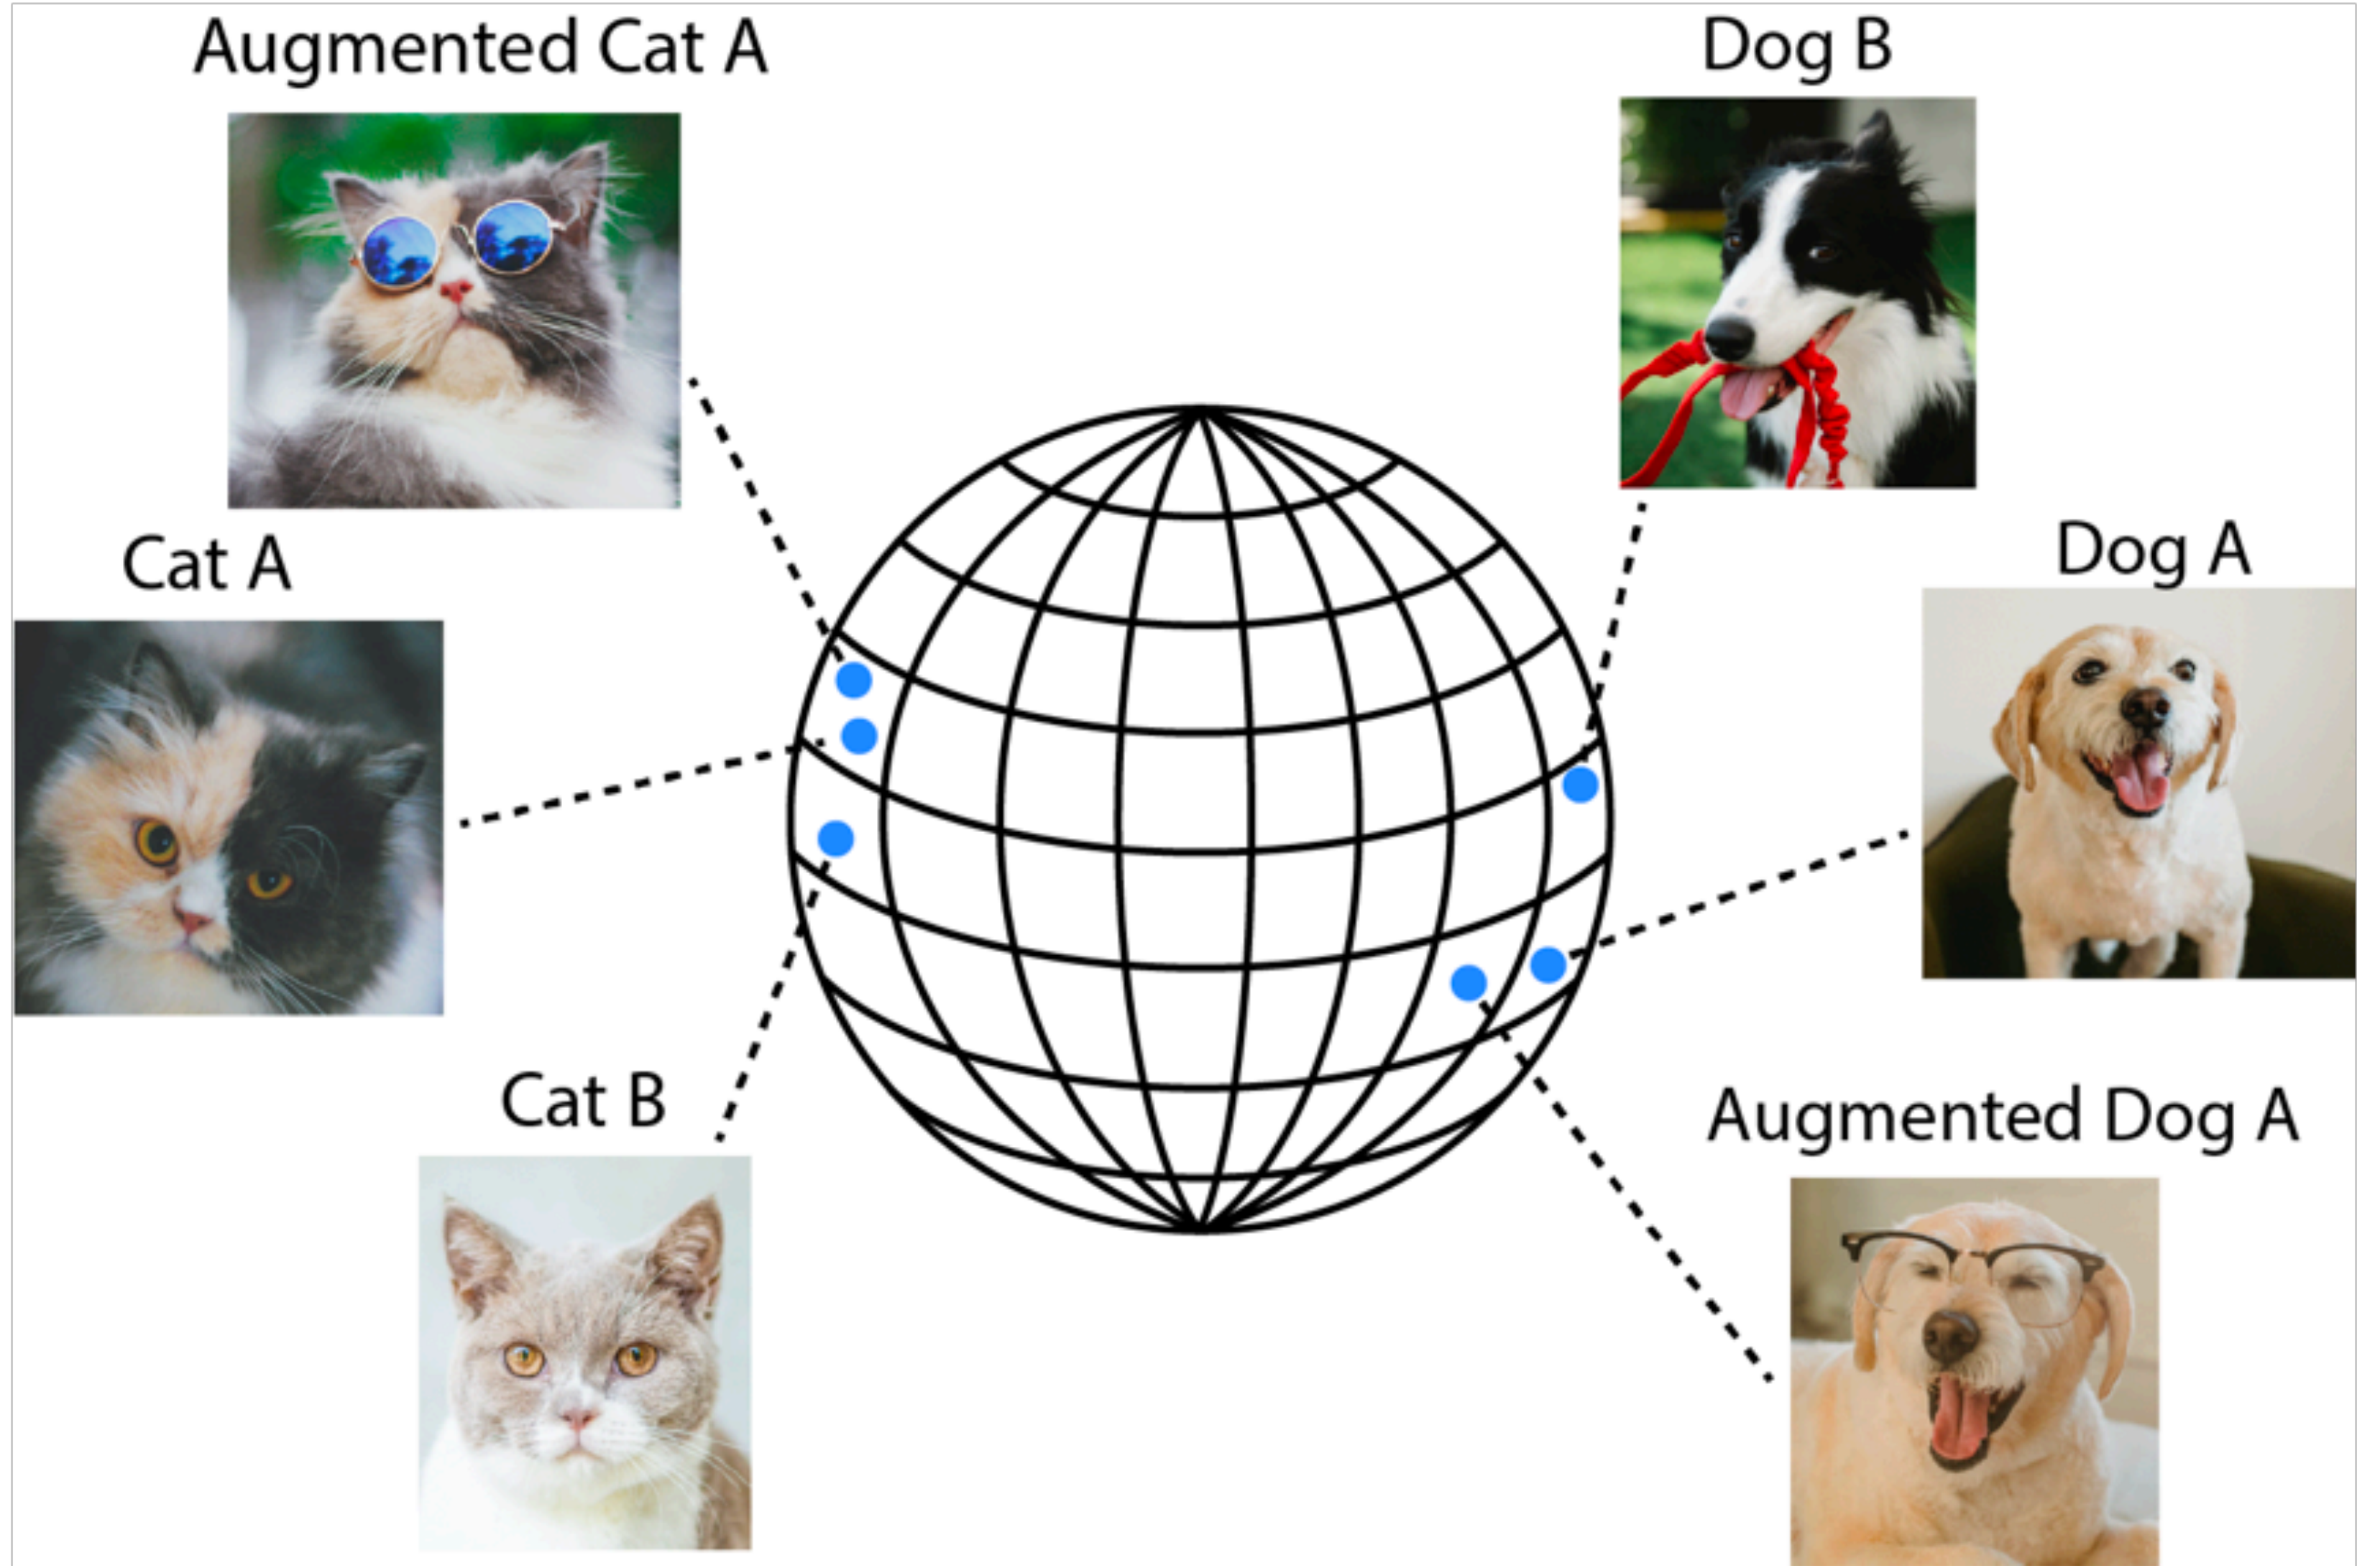

Augmented Dog A

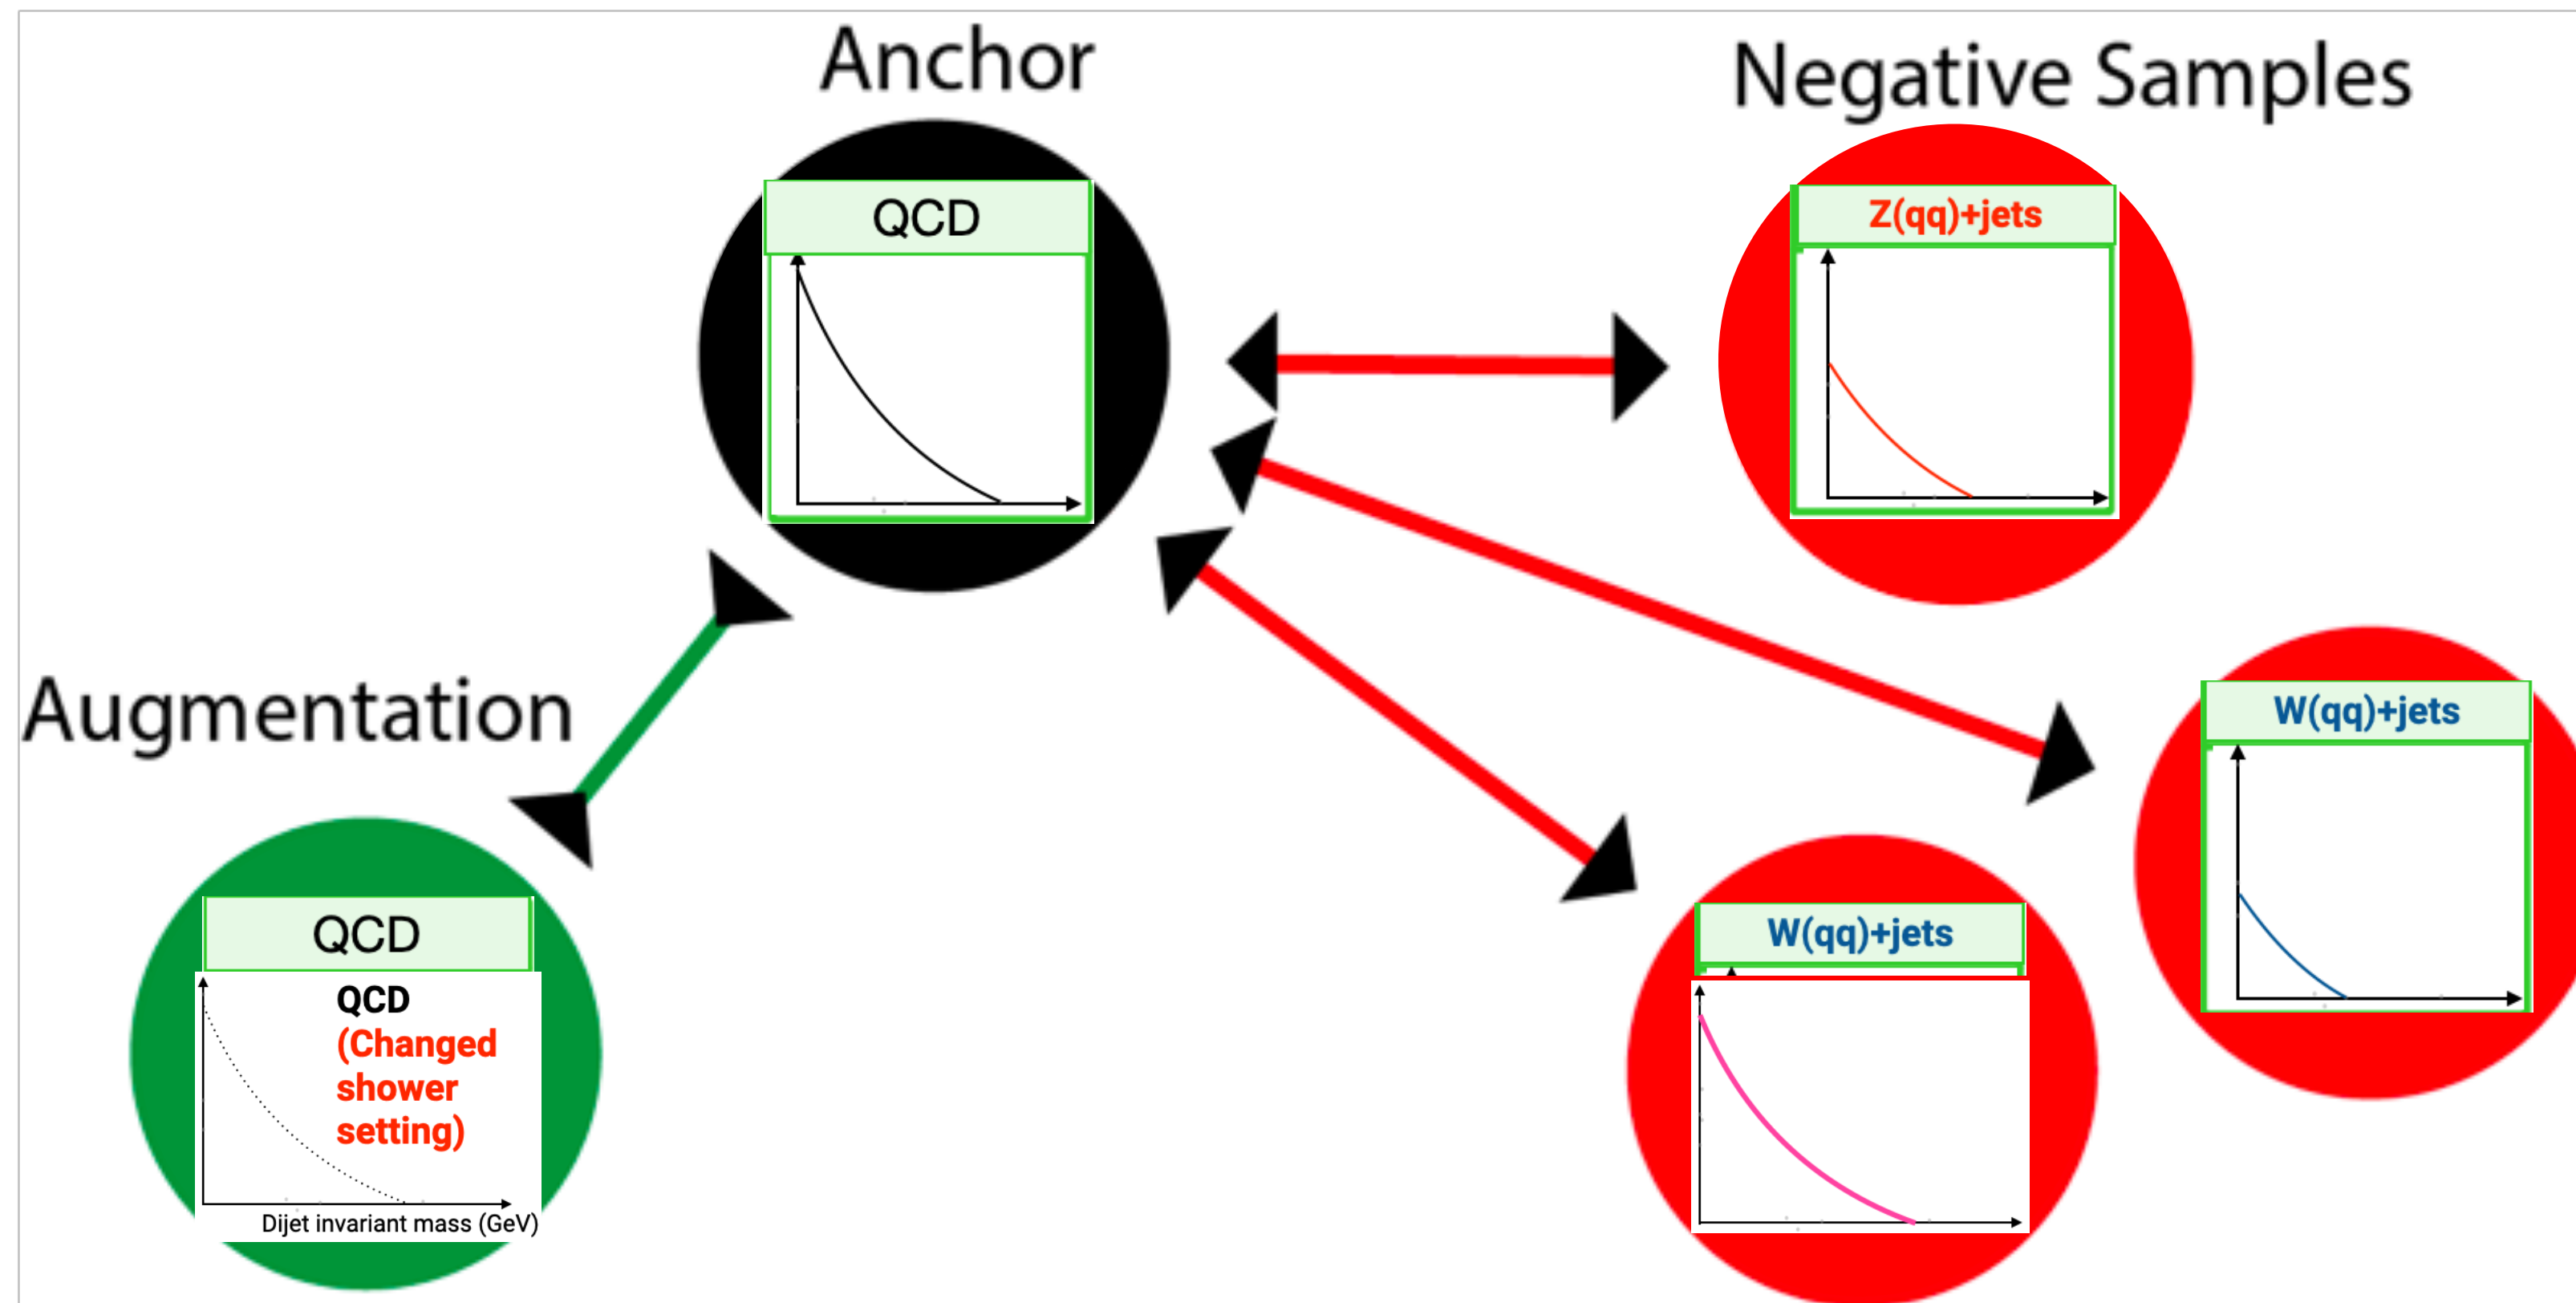

# Contrastive learning (self-supervised)

- Minimizing and maximizing distances learns a space

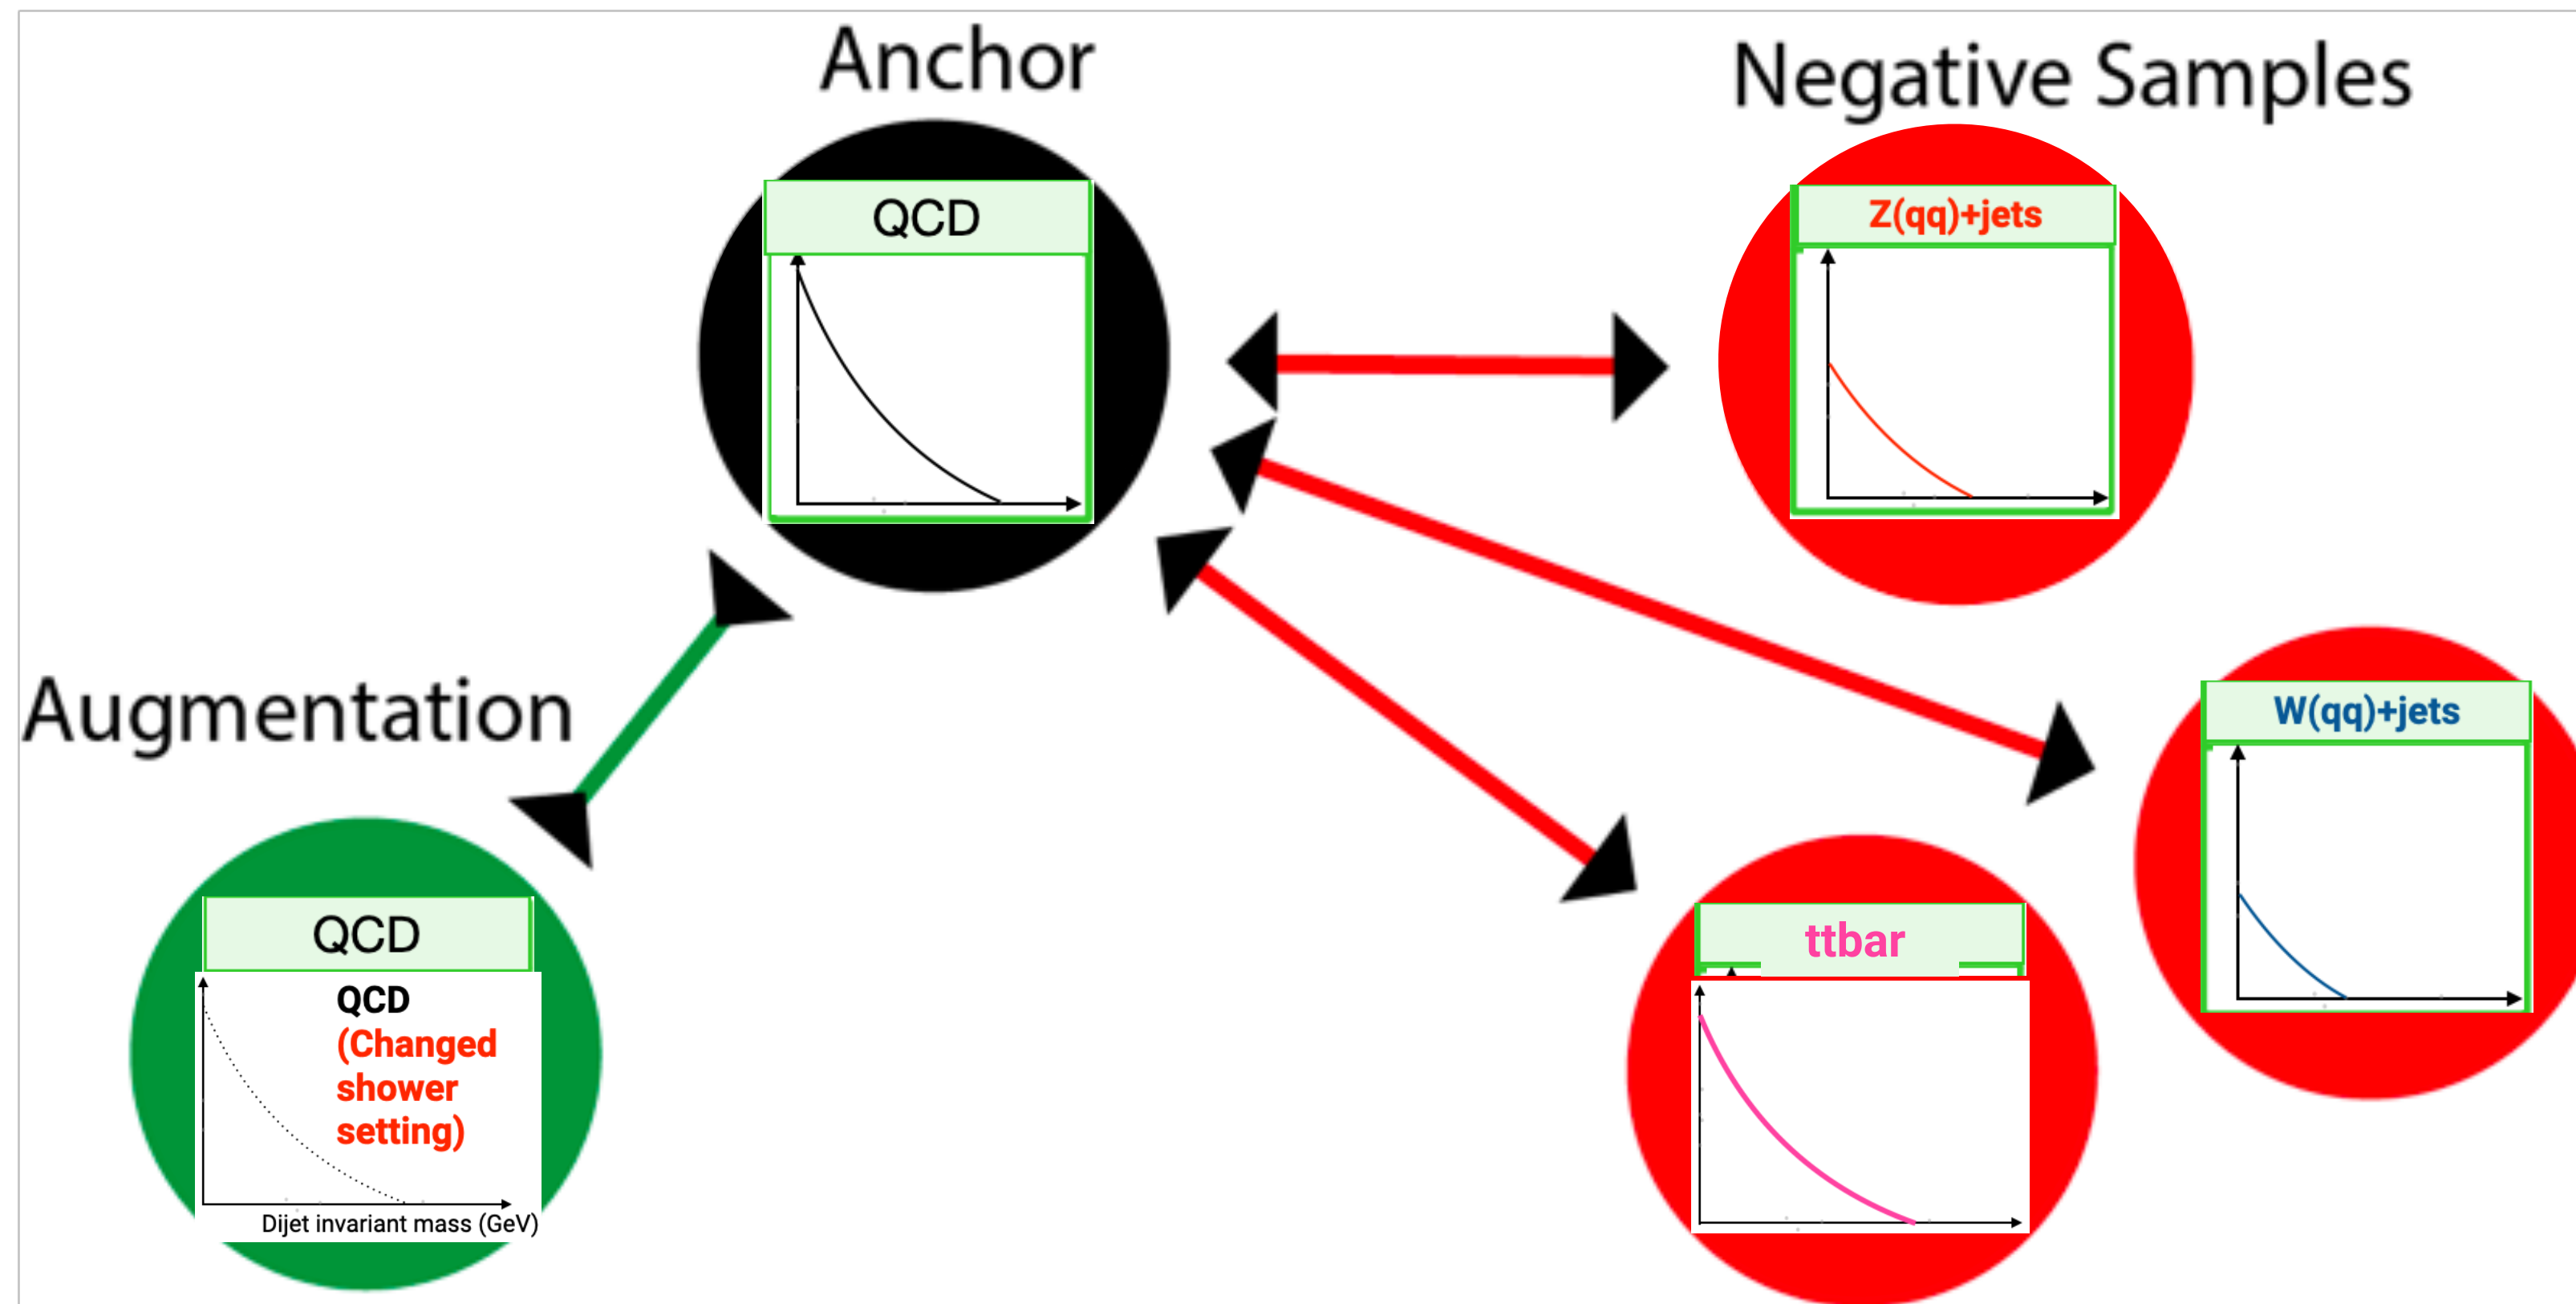

# Physically motivated augmentations?

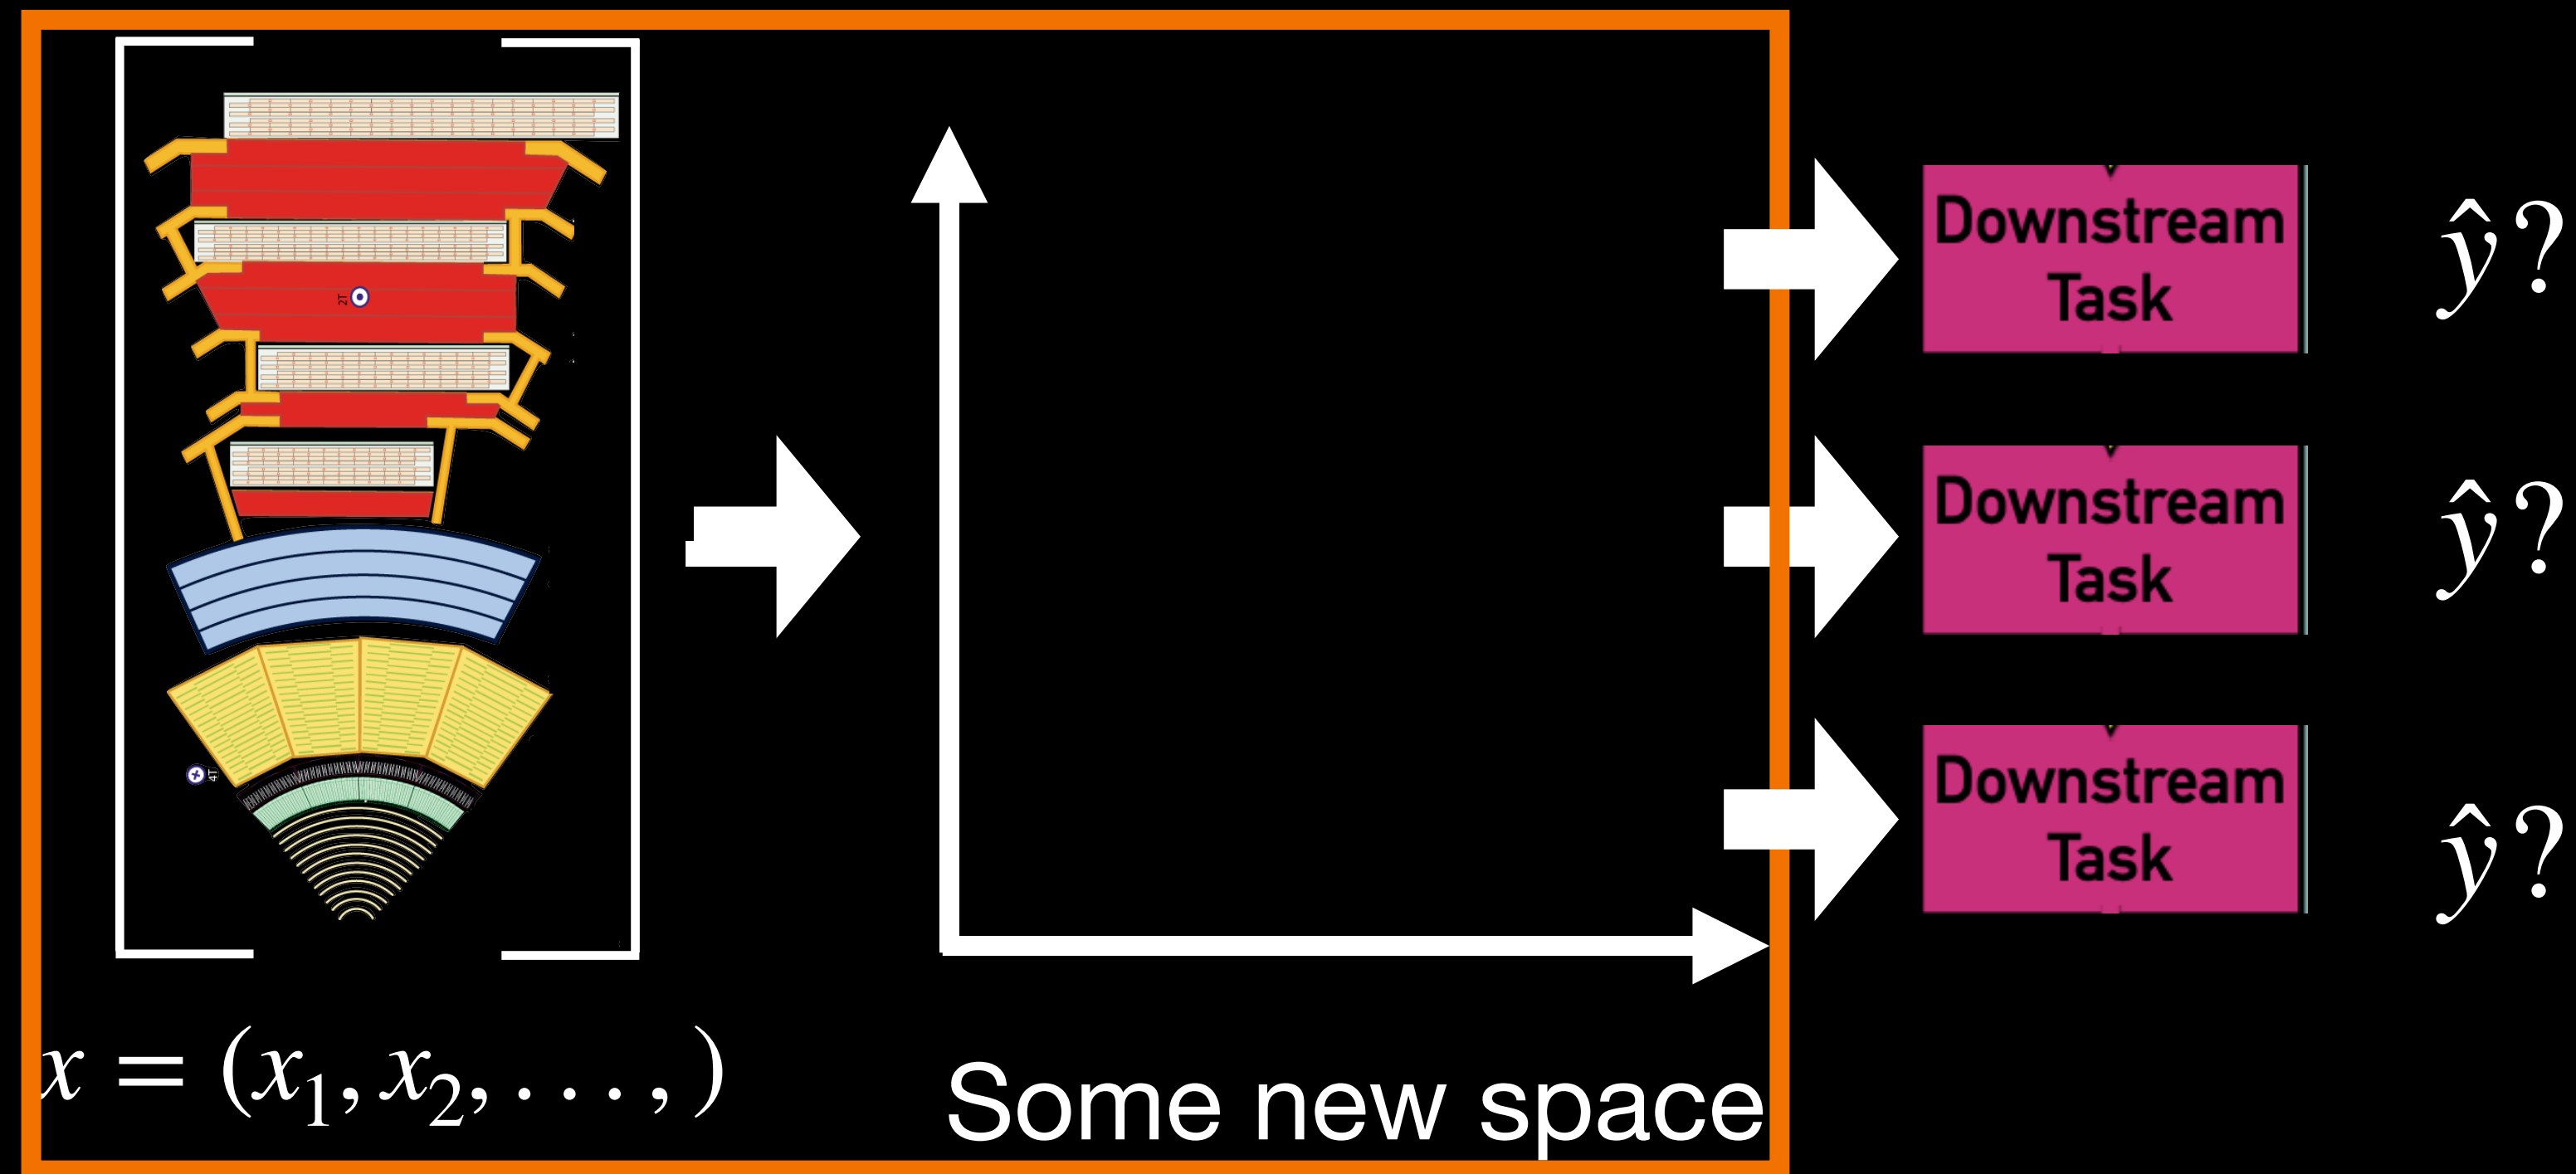

No class labels used in training! How do we augment detector data?

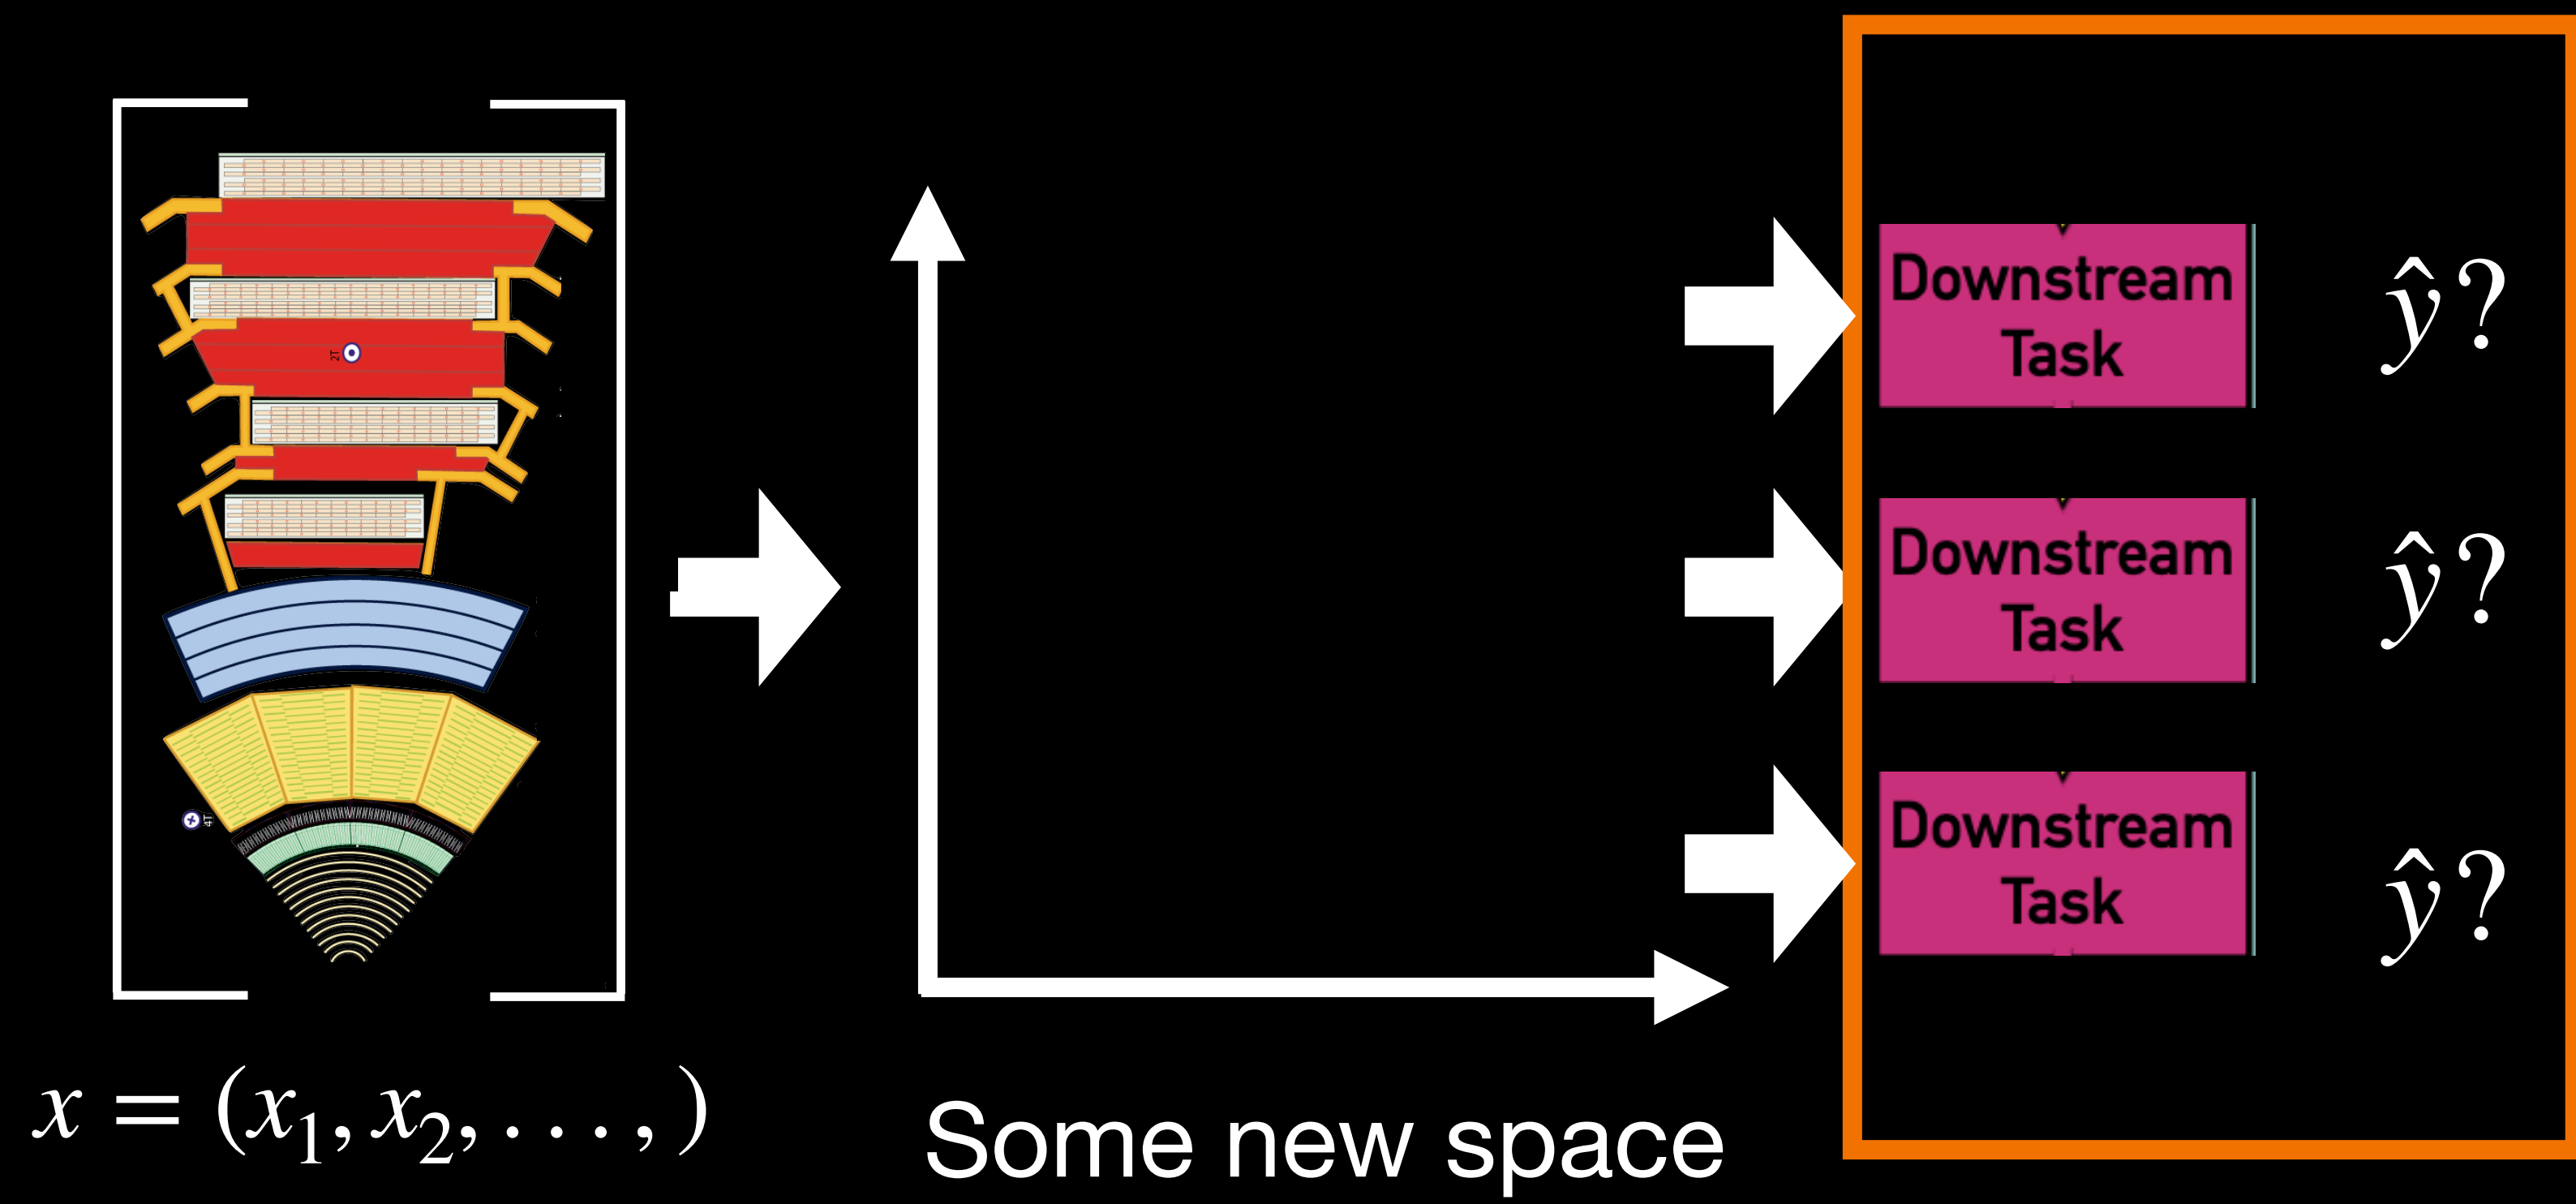

# Physically motivated augmentations?

No class labels used in training! How do we augment detector data?

**Training 1: Learn neural embedding  
(on a lot of data, for a long time)  
On simulation? On data?**

**Training 2: Fine tune for specific task  
(fast, small dataset, simulation)**

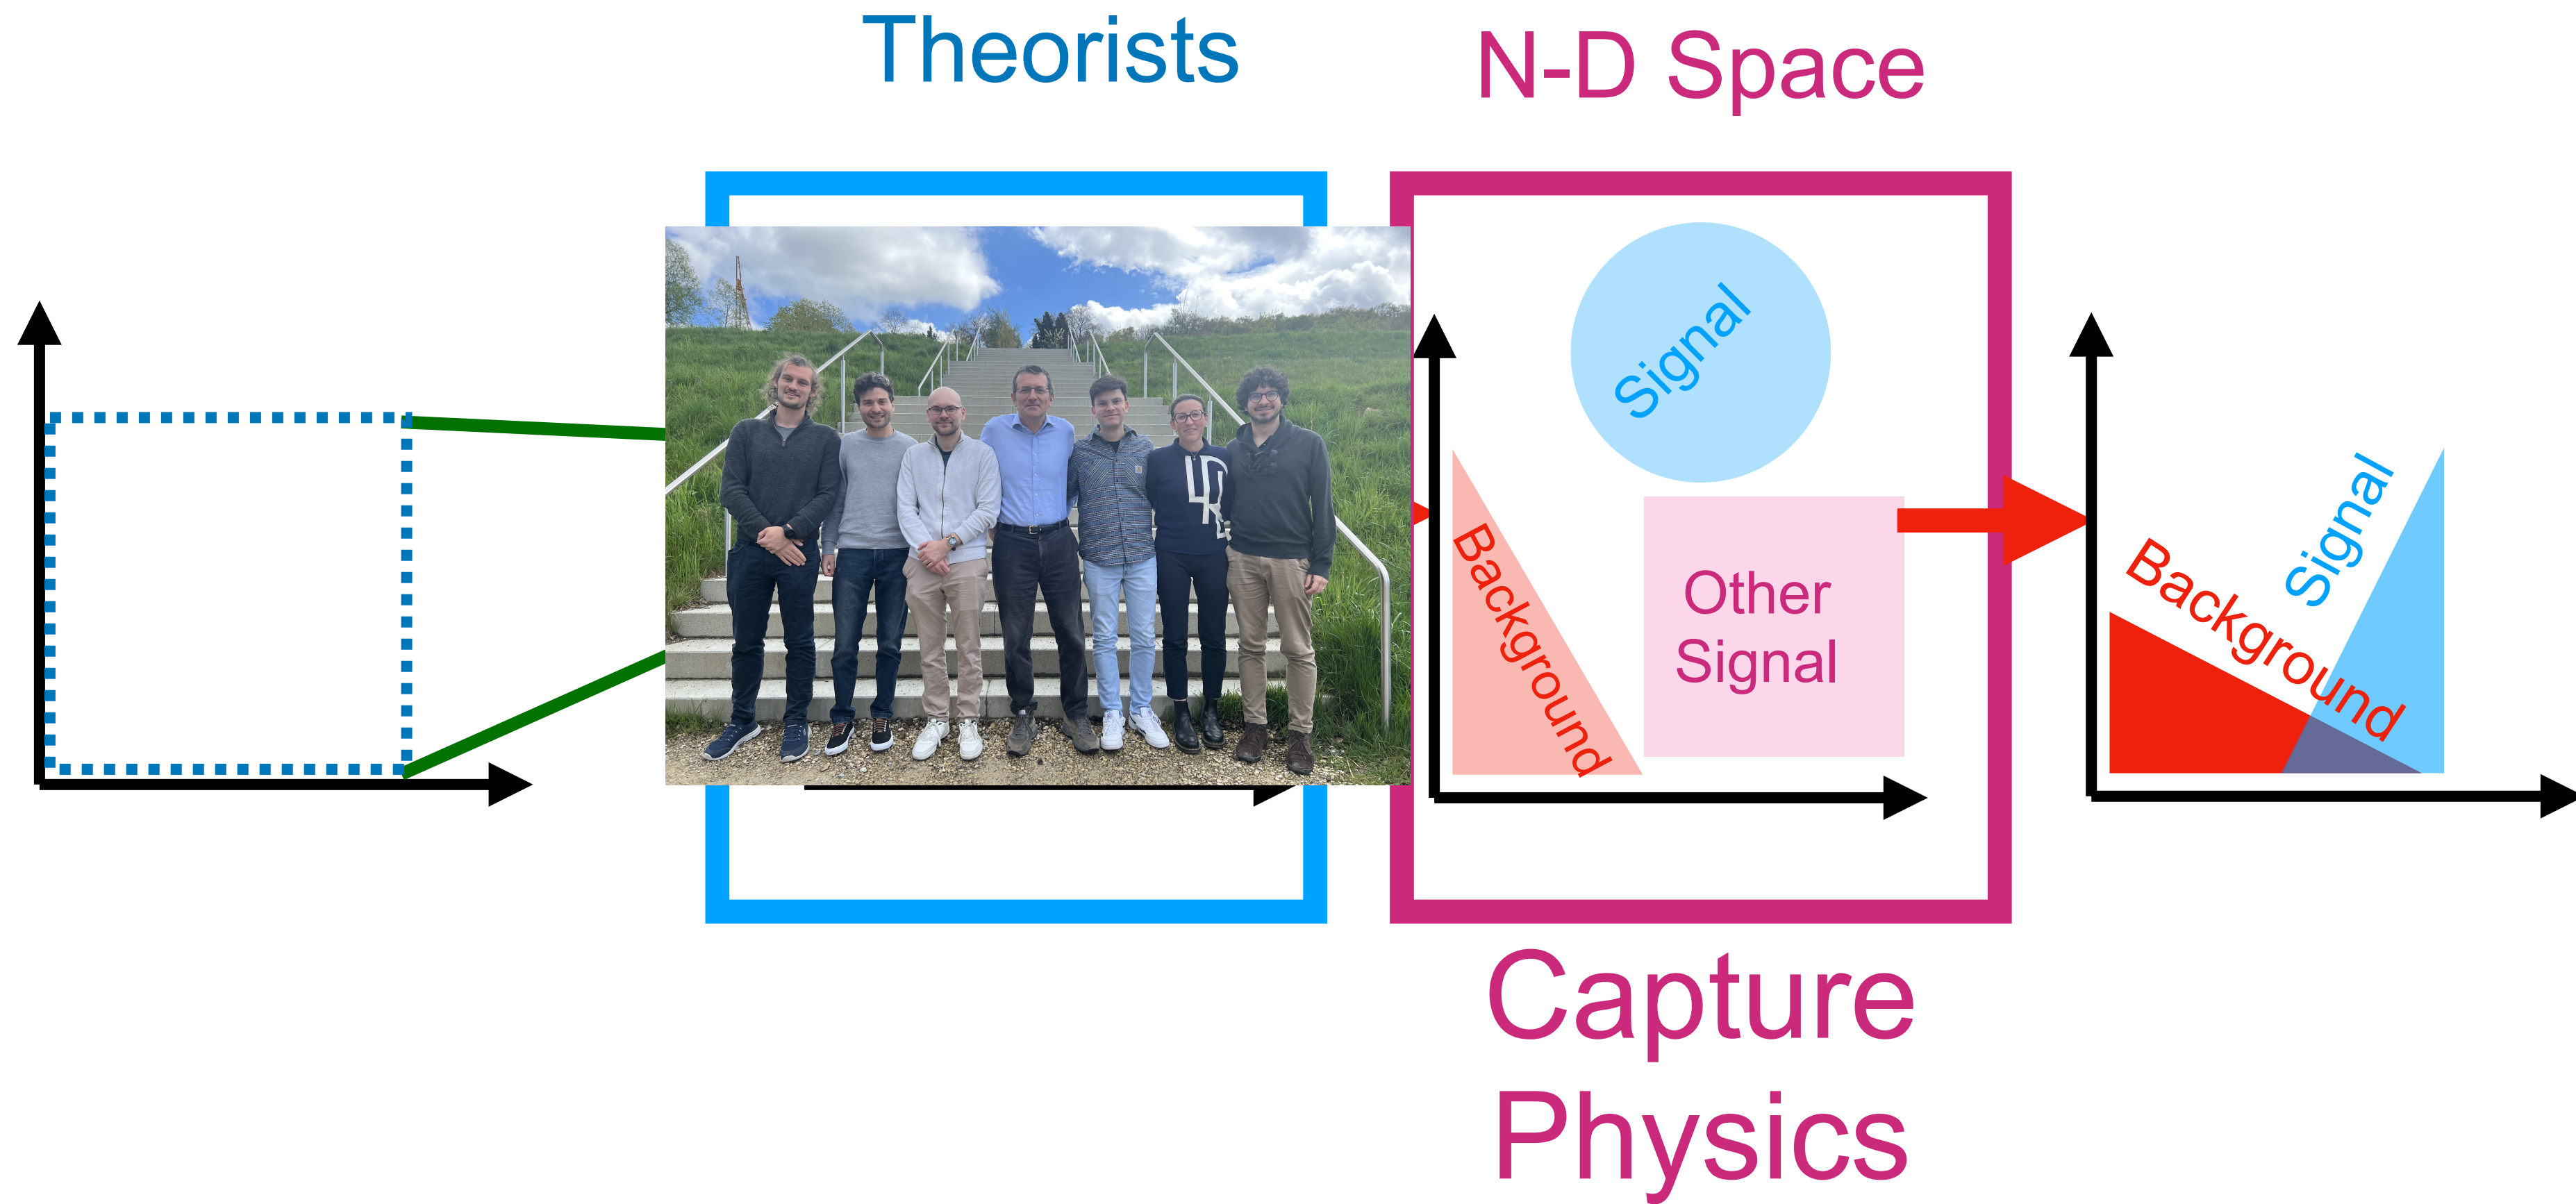

Embedded Space can use any NN to embed

# QM foundation models

- gluon
- quark
- H

→ embedding quantum mechanics into AI algorithm

We can replace the QCD theorist with a NN  
(And it works better)

# Detector design, data acquisition and triggering

# Detector reconstruction and tagging

# AI!
