

HL-LHC IT String Quality Assurance & Control

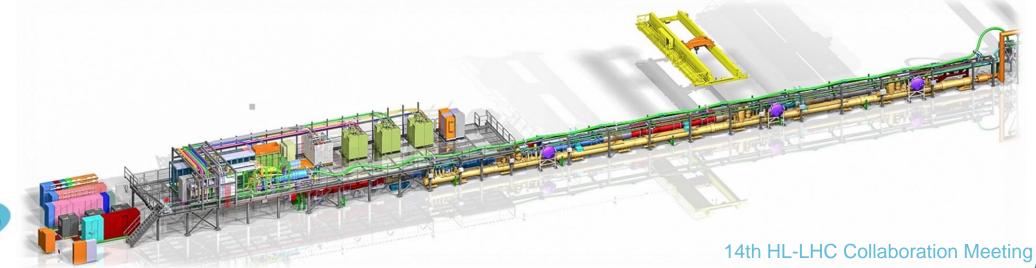

N. Heredia García (TE-MPE-SF) On behalf of WP16

14th HL-LHC Collaboration Meeting, Genoa, 7-10 October 2024

Scope of the talk

- Introduction
- Quality design
- Quality assurance
- Quality control
- Non-conformities
- Lessons learned
- Conclusions

Introduction

- Careful consideration of quality management driven by the diverse components, constraints and required stakeholders.
- Three phases of quality management have been considered, defined by PMI.
- the IT String follows the quality standards and processes established for the HL-LHC project within the <u>quality plan</u>.

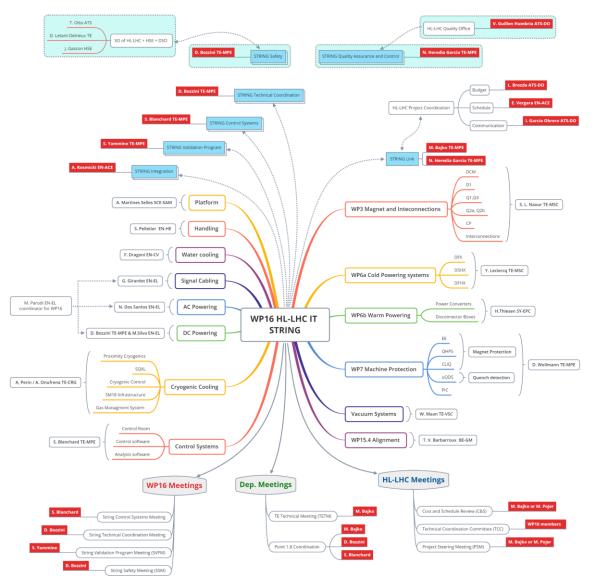

Phase	Goal	Description
Quality design	Plan quality management	Understand the specific needs and requirements of the project. It involves the definition of processes, tools and performance metrics.
Quality assurance	Manage quality	Ensure that the project meets the defined quality standards and requirements. It involves regular reviews, and continuous improvement.
Quality control	Monitor, record and control quality	Validation of the system to ensure a qualified output. It involves testing and corrective actions.

Quality Assurance: Process

 The tools developed during the quality design phase have been continually updated.

 The IT String coordination team has organized/participated in multiple meetings to present project updates, discuss next steps, address non-conformities, provide lessons learned...

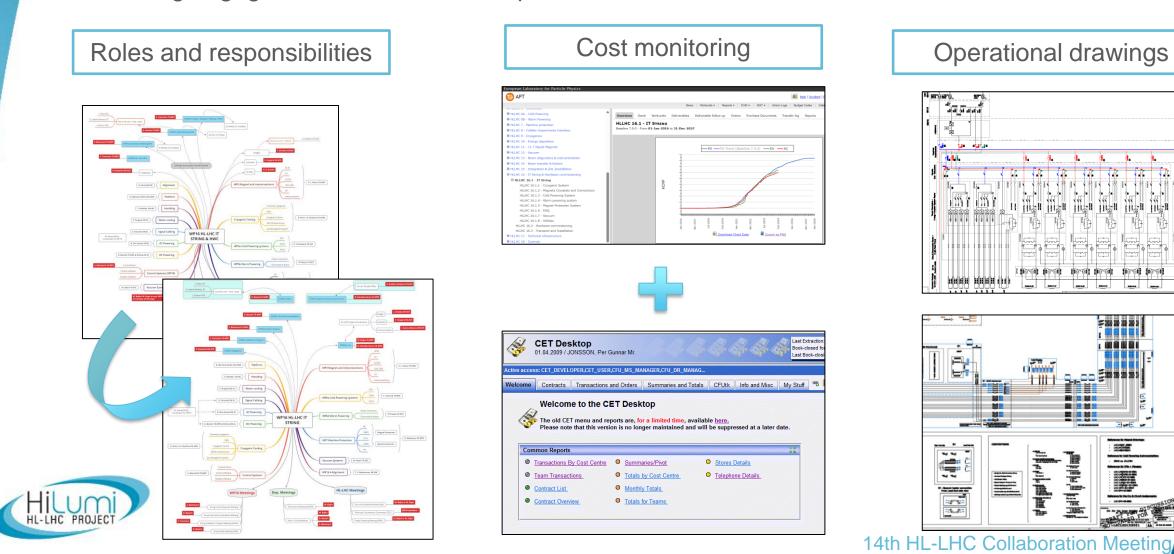

To enhance project execution, various changes, measures, and tools have been implemented, reflecting engagement to continuous improvement:

HL-LHC IT String advancements and challenges for 2024

The commissioning of key equipment on the metallic platform is now completed.

3 MAY, 2024 | By WP16 HL-LHC IT STRING team

Figure 1: Part of the teams that made possible the execution of Short Circuit Tests in the HL-LHC IT String (Credit: CERN/ Cavazza)

The operation of the HL-LHC IT String will mark a significant milestone for the High-Luminosity LHC (HL-LHC) project, as many state-of-the-art technologies developed for the HL-LHC will work collectively for the first time.

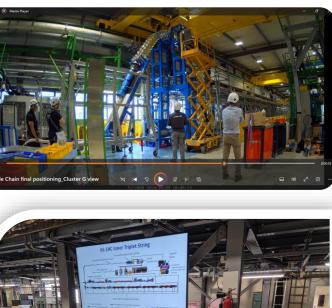

In the last episode of the HL-LHC IT String, <u>featured in Accelerating News</u>, we highlighted the completion of infrastructure installations for the test stand and the readiness of some equipment to be commissioned.

Quality Control: Process

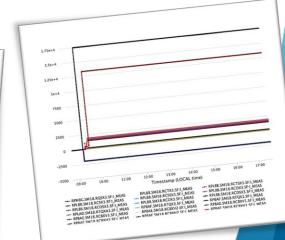

- Quality control tests are managed by the equipment owner.
- The String coordination team:
 - Ensure proper conditions for the execution of the tests.
 - Follow up the activities on-site.
 - Check that the test results are documented.
- Tests procedures are defined as part of the String Validation Program.

Quality control: MTF

- For the follow up of the quality checks WP16 proposed a MTF structure that was agreed with the HL-LHC Quality Office.
- The Manufacturing and Test Folder (MTF) is used at CERN to register manufacturing and quality control steps, it is imbricated in EDMS.
- The structure is divided in several systems, and steps are defined for each of them.
- Steps are extracted from test procedures.

The hydraulic circuit of the IT String integrates an Eletta flow meter/switch for each hydraulic branch feeding the Water-Cooled Cables (WCC). These flow switches are hardwired to the power converters (PCS) leading to a power abort when the water flow rate is beneath the defined threshold value. In the current IT String configuration of the hydraulic network [1], the WCC of the RCBXH1 and RCBXV1 circuits are hydraulically connected in series, demanding a nominal flow rate of 12 (/min of demineralized water [2] (keeping the temperature increase of the cooling water traversing the WCC beneath 10 *C). The remaining 2 kA circuits (i.e. RCBXH2, RCBXH3, RCBXH3, RCBXH3, RCDX1, and RTQXB) currently form individual hydraulic					tions to series configuration.

Non-conformities: Quality Meetings

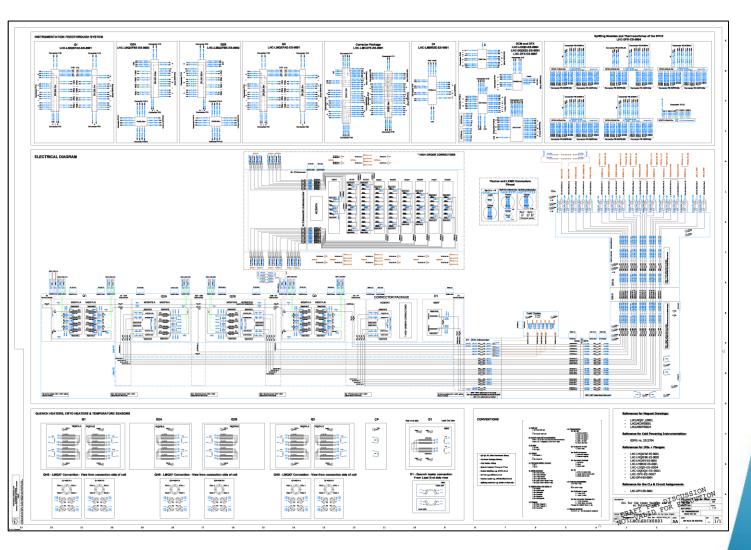

- A series of meeting have been launched with the HL-LHC Quality Office. Assets codes of the equipment coming to the IT String are been identified.
- Using the asset codes, non-conformities have been extracted using Pentaho tool and some of them reviewed. Also, assets will be attached to the String MTF structure to have full traceability of their installation.
- On a weekly basis, the HL-LHC Quality Office informs WP16 via email about the status of open non-conformities in the HL-LHC project.

Non-conformities: Quality Meetings

- For the equipment nonconformities tagged as "electrical", an exercise is being initiated in the coordination team to integrate them as part of the general instrumentation layout drawing.
- Deviations from the baseline will also be signaled in this "As-built" drawing.
- This drawing will help to analyse the test results.

Lessons Learned

- Lessons learned have been transmitted to the HL-LHC project in different forums (WP15 integration meeting, TCC, String Day).
- Non-conformity reports contain a chapter dedicated to lessons learned.

L-LHC PROJECT

- Working meetings have been organised with the intervening teams after completing an installation to discuss areas of improvement.
- A document of lessons learned will be drafted to gather all the feedback communicated.

Conclusions

- Sound quality processes are in place in the IT String, with improvements in various aspects.
- Effective collaboration and support from the HL-LHC quality office to deal with quality subjects.
- Intervening teams are committed to quality, and they count with experience in quality assurance/control methods.
- WP16 discovered non-conformities up to now are not critical and corrective measurement have been successfully implemented.
- A meeting dedicated to quality is launched to review, among others, equipment non-conformities potentially affecting the IT String.
- Lessons learned from the IT String experience have been gathered and communicated.

Thank you for your attention
