

Bulk Resistivity measurement of Phenolic

Liang Guan

>> Method

>> New measurement on Sample Batch4-T1

Bulk Resistivity measurement-Method (1)

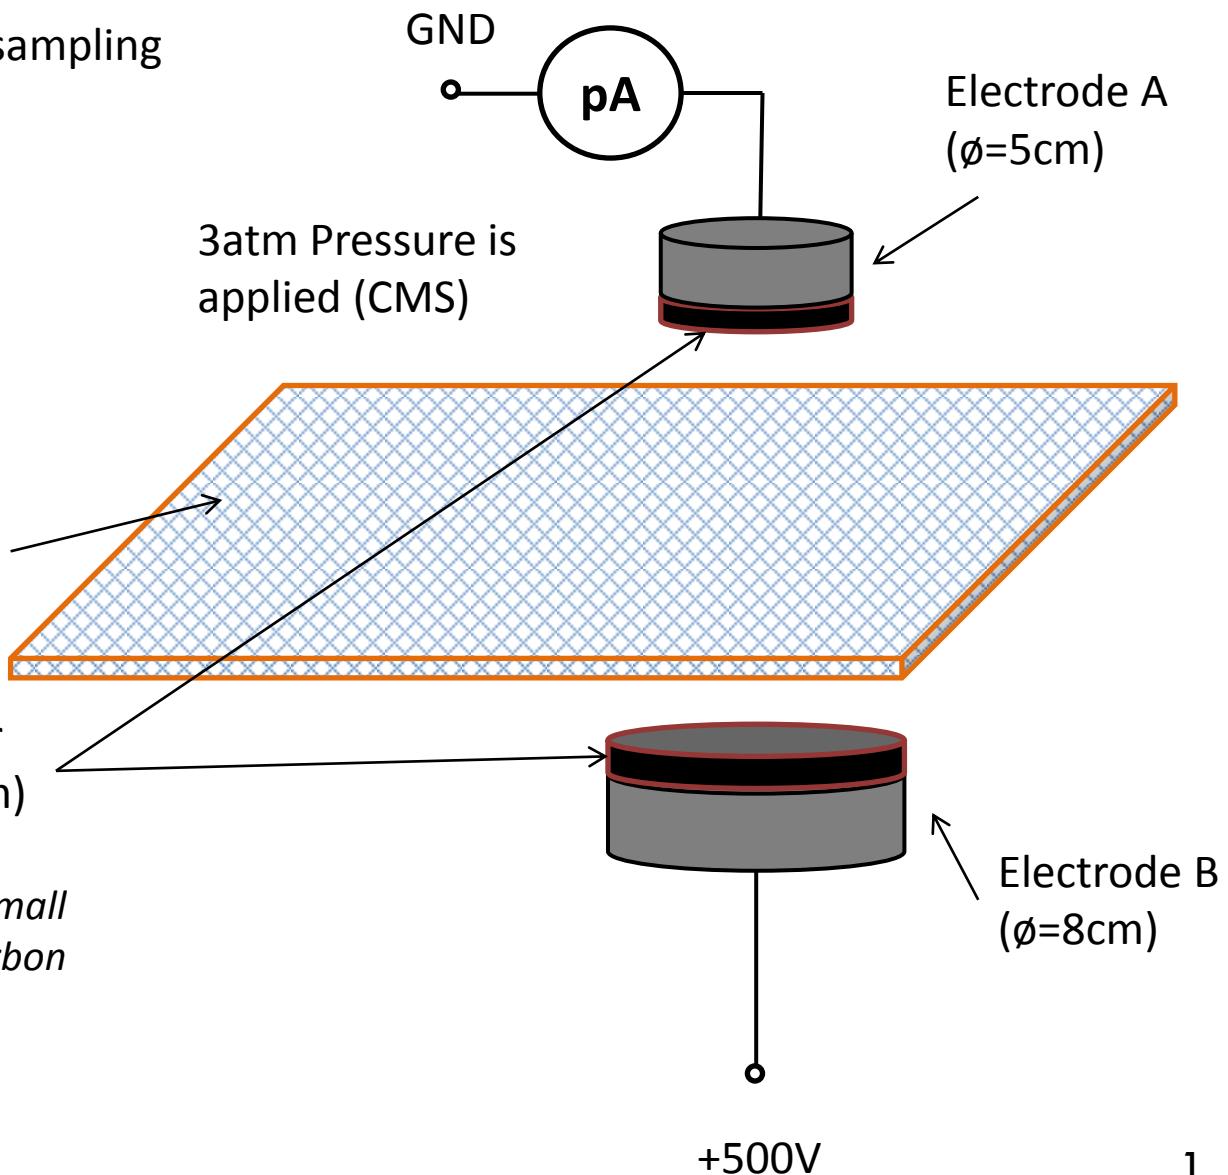

- $9(3 \times 3)/25(5 \times 5)$ points sampling

11	12	13	14	15
21	22	23	24	25
31	32	33	34	35
41	42	43	44	45
51	52	53	54	55

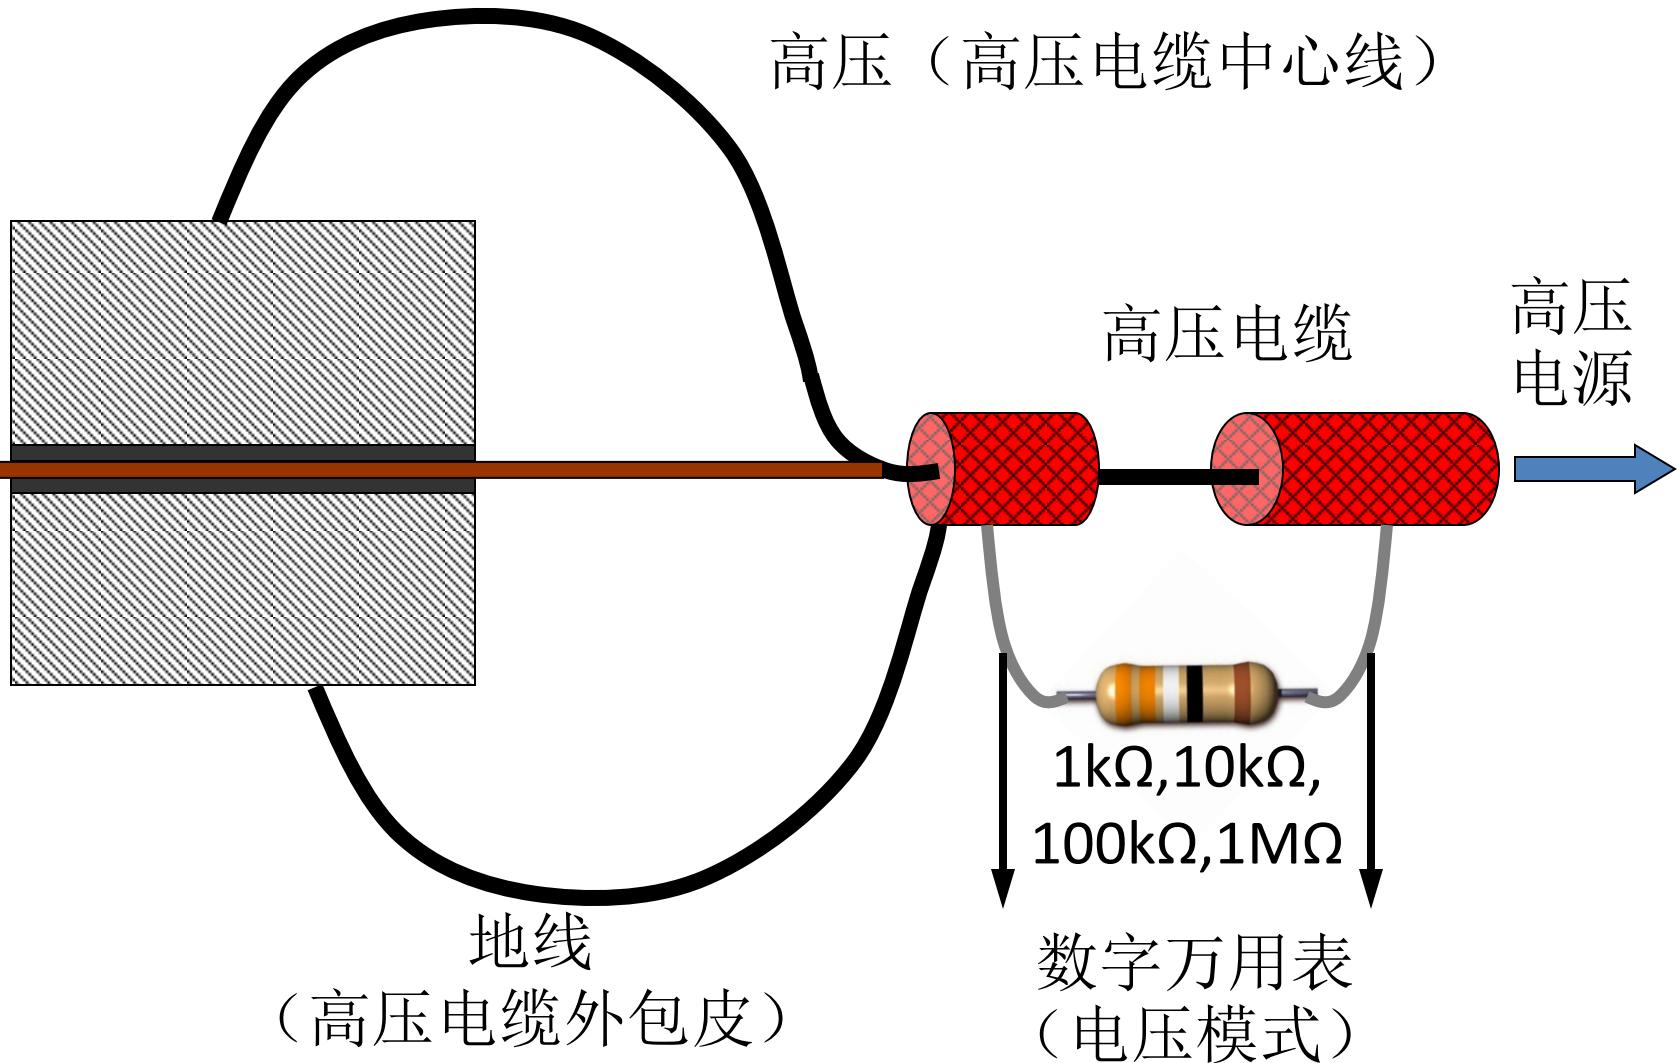

Specimen
(Size: 40cm*40cm
Thickness:1mm)

Conductive rubber
(thickness: 0.5-1mm)

* rubber filled with small
conducting metal or carbon
spheres

Bulk Resistivity measurement-Method (1)

Bulk Resistivity measurement-Method (3)

- Assume Effective area

$$S = 3.14 \times (2.5\text{cm})^2 = 19.6 \text{ cm}^2$$

- Sample bulk resistivity on the order of $10^8 \Omega\cdot\text{cm}$ / $10^9 \Omega\cdot\text{cm}$ and thickness of 1 mm

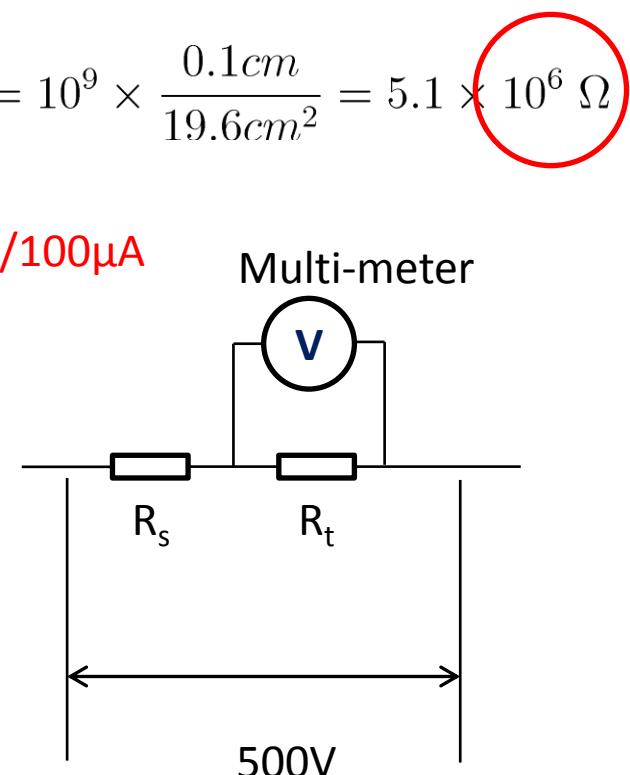

$$R_s = \rho_v \frac{t}{S} = 10^8 \times \frac{0.1\text{cm}}{19.6\text{cm}^2} = 5.1 \times 10^5 \Omega$$

$$R_s = \rho_v \frac{t}{S} = 10^9 \times \frac{0.1\text{cm}}{19.6\text{cm}^2} = 5.1 \times 10^6 \Omega$$

- For HV=500V, current flowing through sample $\sim 1000\mu\text{A}/100\mu\text{A}$

- Voltage scale on R_t

$R_s [\Omega]$	1	10	100
$R_t [k\Omega]$	1	10	100
5×10^6	0.1V	1V	10V
5×10^5	1V	10V	100V

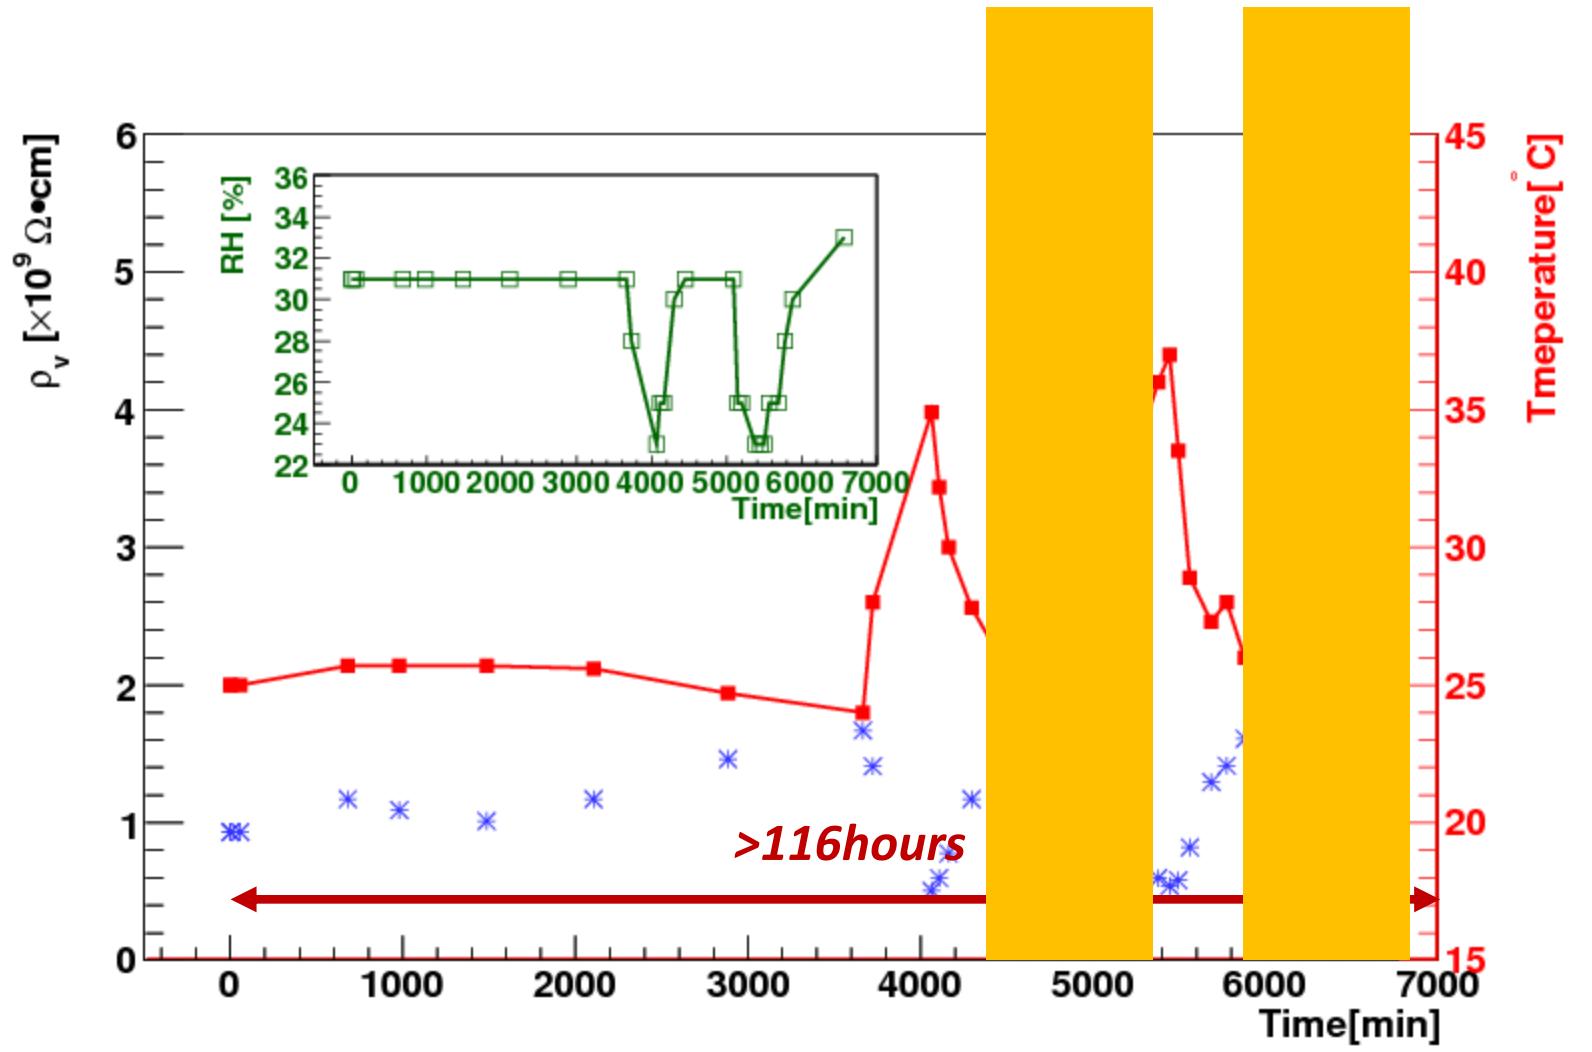

Logbook

- Specify the sample ID, charging time, RH, Temperature etc.

Preliminary

Sample ID	Test Point	HV[V]	Aeff[cm^2]	Thickness[cm]	Current[A]	Comment	Tester	TestDate	TestTime	Charging Time[min]	ρ	Temp[C]	RH[%]

Bulk resistivity of Batch 4-T1 sample

Bulk resistivity of Batch 4-T1 sample

- Measured resistivity is **on the order of 10^9 Ohm.cm** at Room temperature → similar to the value measured 2 weeks ago but still a factor of two higher than the value measured 2 months ago when the sample just arrived.
- Bulk resistivity value of the sample Batch4-T1 shows some correlation with the temperature
 - lower temperature results in higher resistivity
 - resistivity value @ ~25C slightly increasing during one week test (RH<40%)

Material study - Prof. Changguo Lu's study

- Surface condition: defects such as pins, hole, ridge etc. present on the inner surface of Bakelite will make shape electric field thus increasing the noise rate
- UV absorption
- Ageing: HF acid *chemical active*

ATLAS RPC

C4H10 5% SF6 0.3%
C2H2F2 94.7%

CMS RPC

C4H10 3.5% SF6 0.3%
C2H2F2 96.2%

- Significantly reduce resistivity
- surface smoothness

- Water : Help to slow down the decrease of resistivity but also help to form HF
