A flavorful and dark cascade for low-scale leptogenesis

Thursday 19 June 2025 16:04 (17 minutes)

I will discuss a novel low-scale leptogenesis mechanism involving CP-asymmetric (but lepton-number-conserving) decays of sterile neutrinos, followed by a neutrino-generation-philic dark-sector cascade that generates a surplus of visible baryon number. Relevant model-building considerations and constraints will be discussed in detail.
