

LHC and HL-LHC Status

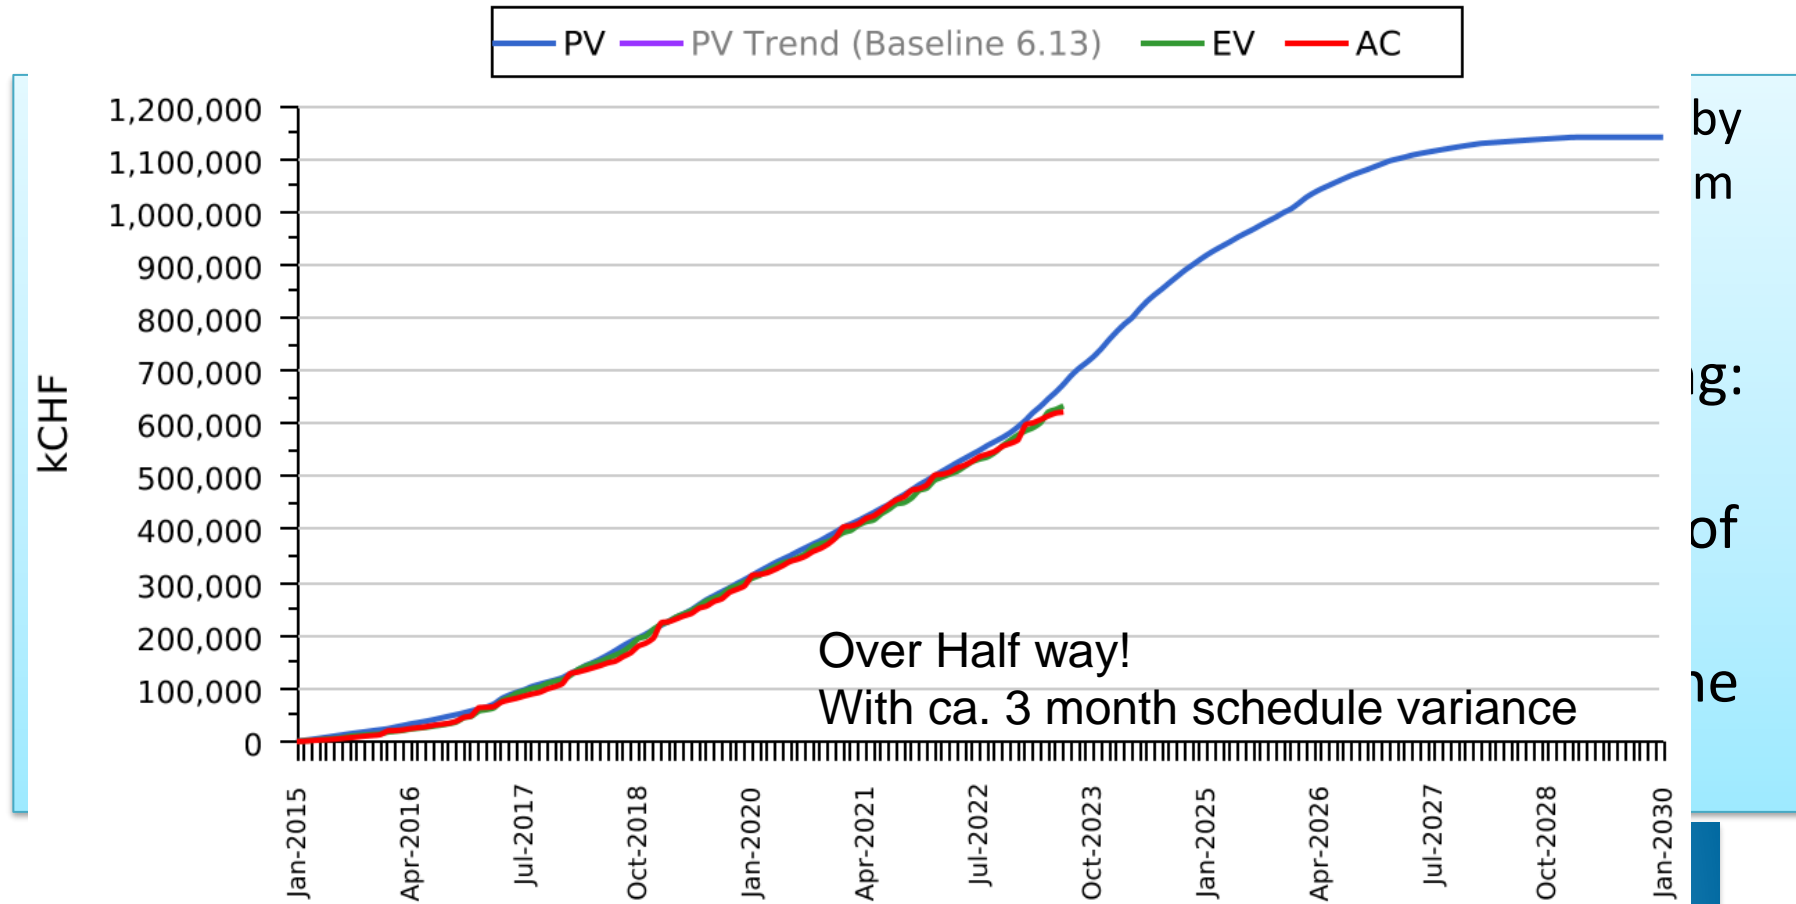

Y. Papaphilippou, CERN

On behalf of the HL-LHC project

Particular thanks to O. Brunning and R. Tomas for the material

Corfu2024 Workshop on the Standard Model and Beyond – 03/09/2024

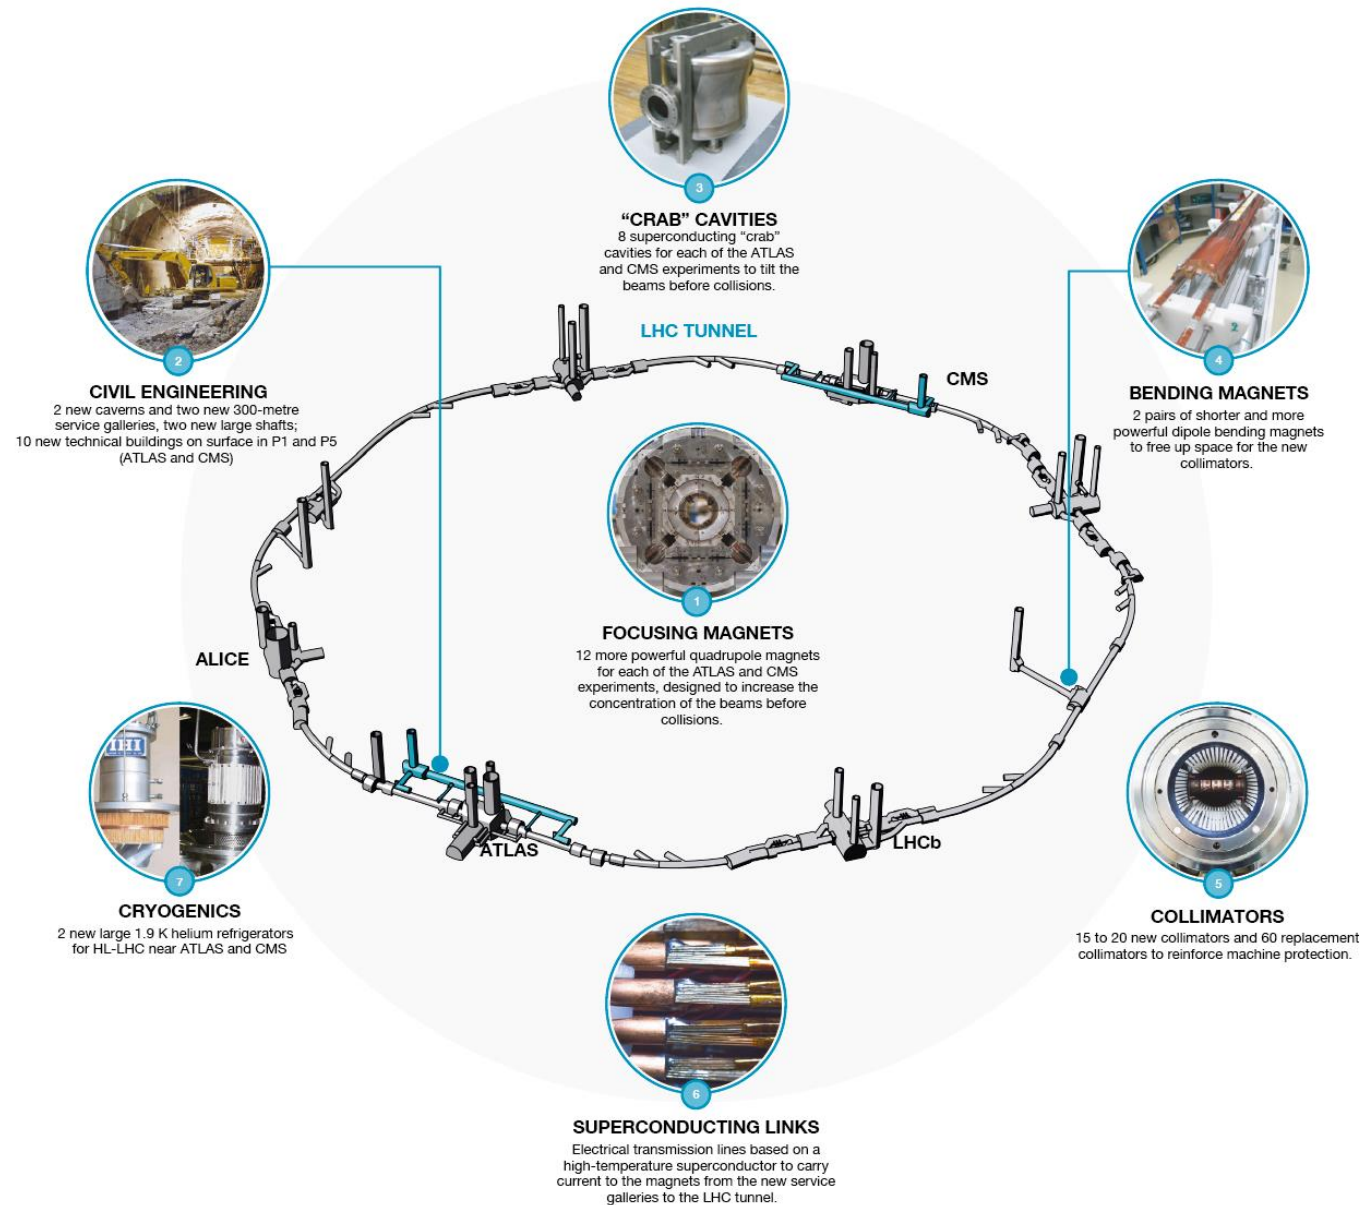

Reminder of the HL-LHC Goals

Project: LRD-PRJ
Baseline: Baseline 6.7

01-Sep-2023 10:07

HiLumi LHC landmarks: a project for Physics and Technology leap

LHC upgrade goals: Performance optimisation

Luminosity recipe (round beams):

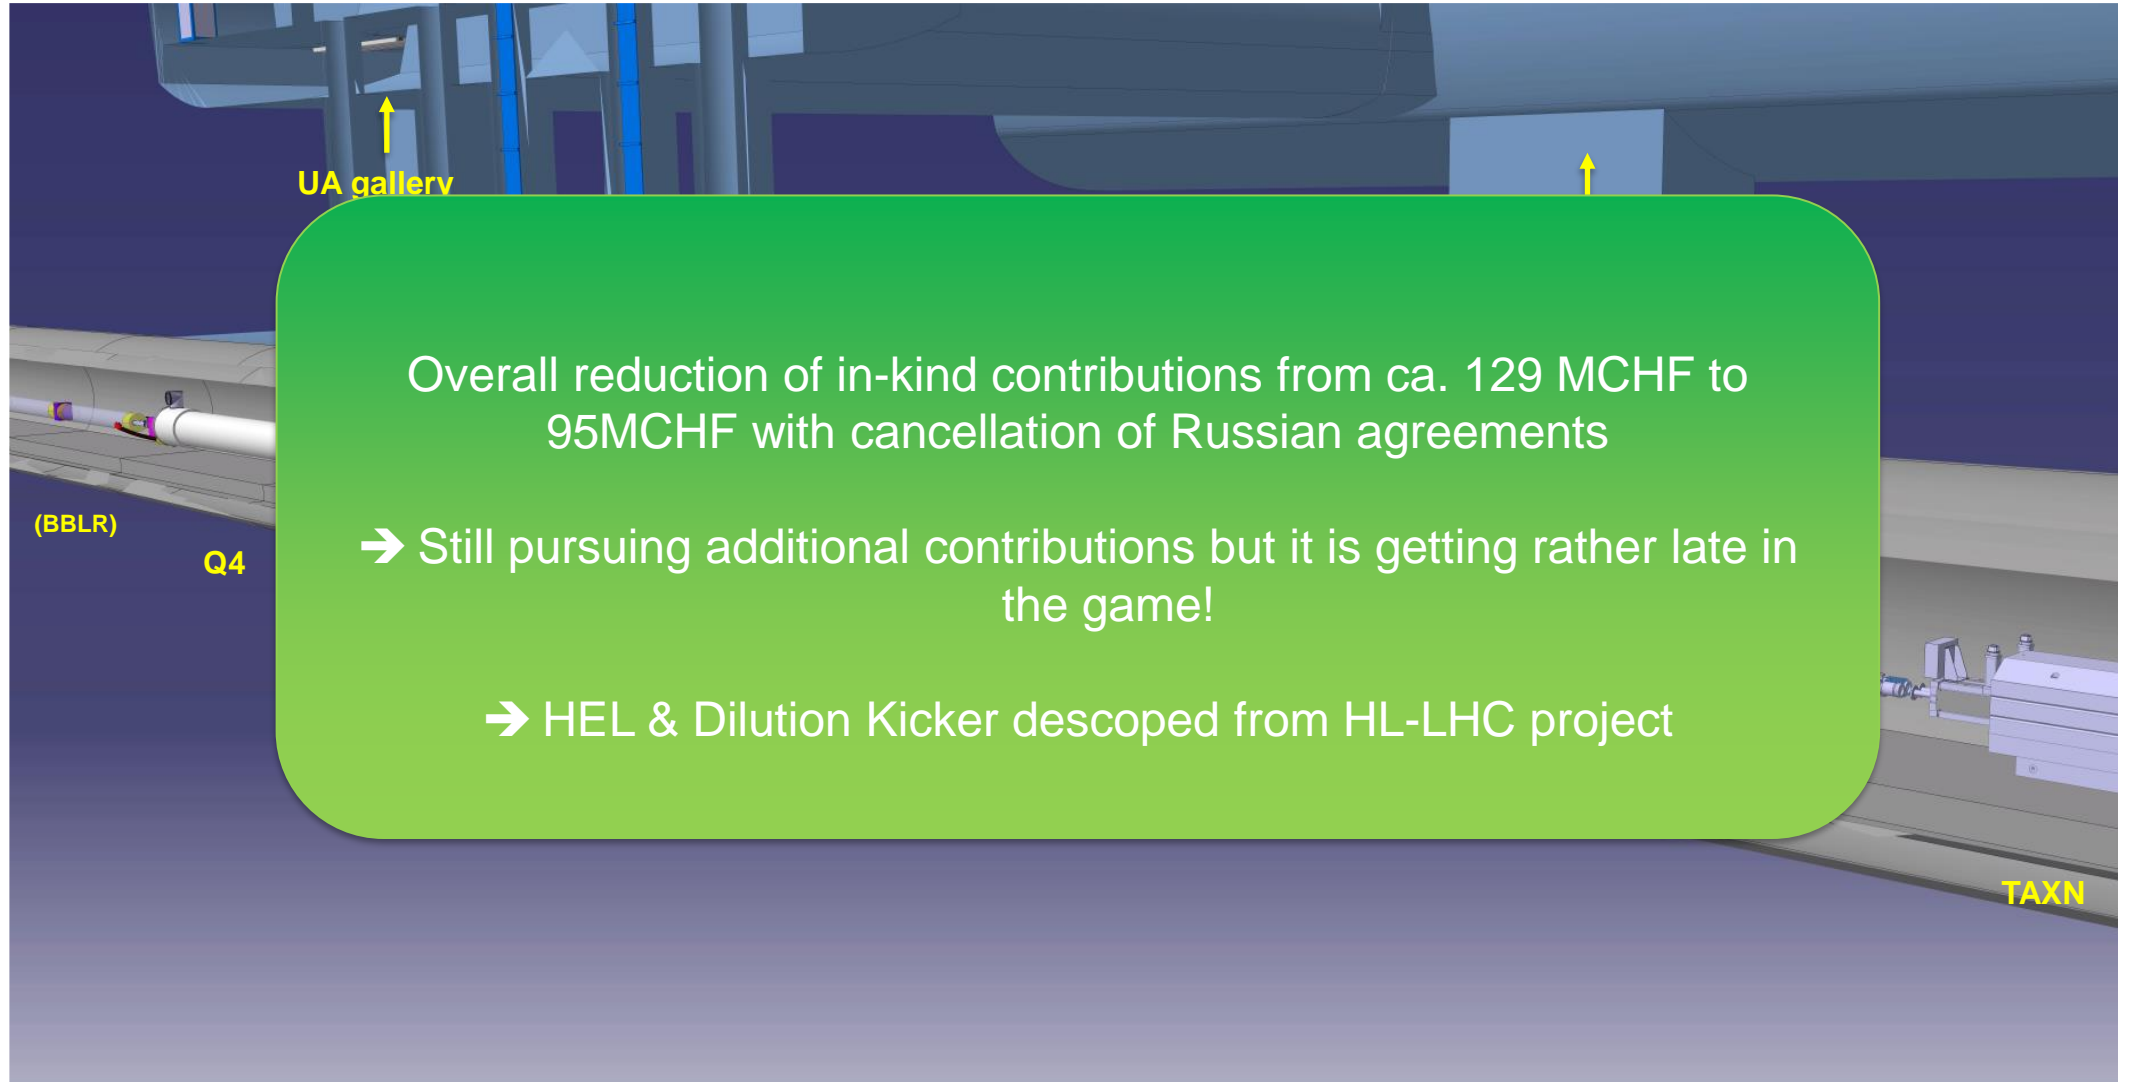

$$L = \frac{n_b \times N_1 \times N_2 \times g \times f_{rev}}{4\rho \times b^* \times e_n} \times F(f, b^*, e, S_s)$$

- 1) maximize bunch intensities
 - 2) minimize the beam emittance
 - 3) minimize beam size (constant beam power); → triplet aperture
 - 4) maximize number of bunches (beam power); → 25ns
 - 5) compensate for 'F'; → Crab Cavities
 - 6) Improve machine 'Efficiency' → minimize number of unscheduled beam aborts
- Injector complex
Upgrade LIU

International Collaboration

The MS region with in-kind contributions

Overall reduction of in-kind contributions from ca. 129 MCHF to 95MCHF with cancellation of Russian agreements

→ Still pursuing additional contributions but it is getting rather late in the game!

→ HEL & Dilution Kicker descope from HL-LHC project

HL-LHC Scope in 1R and 5R

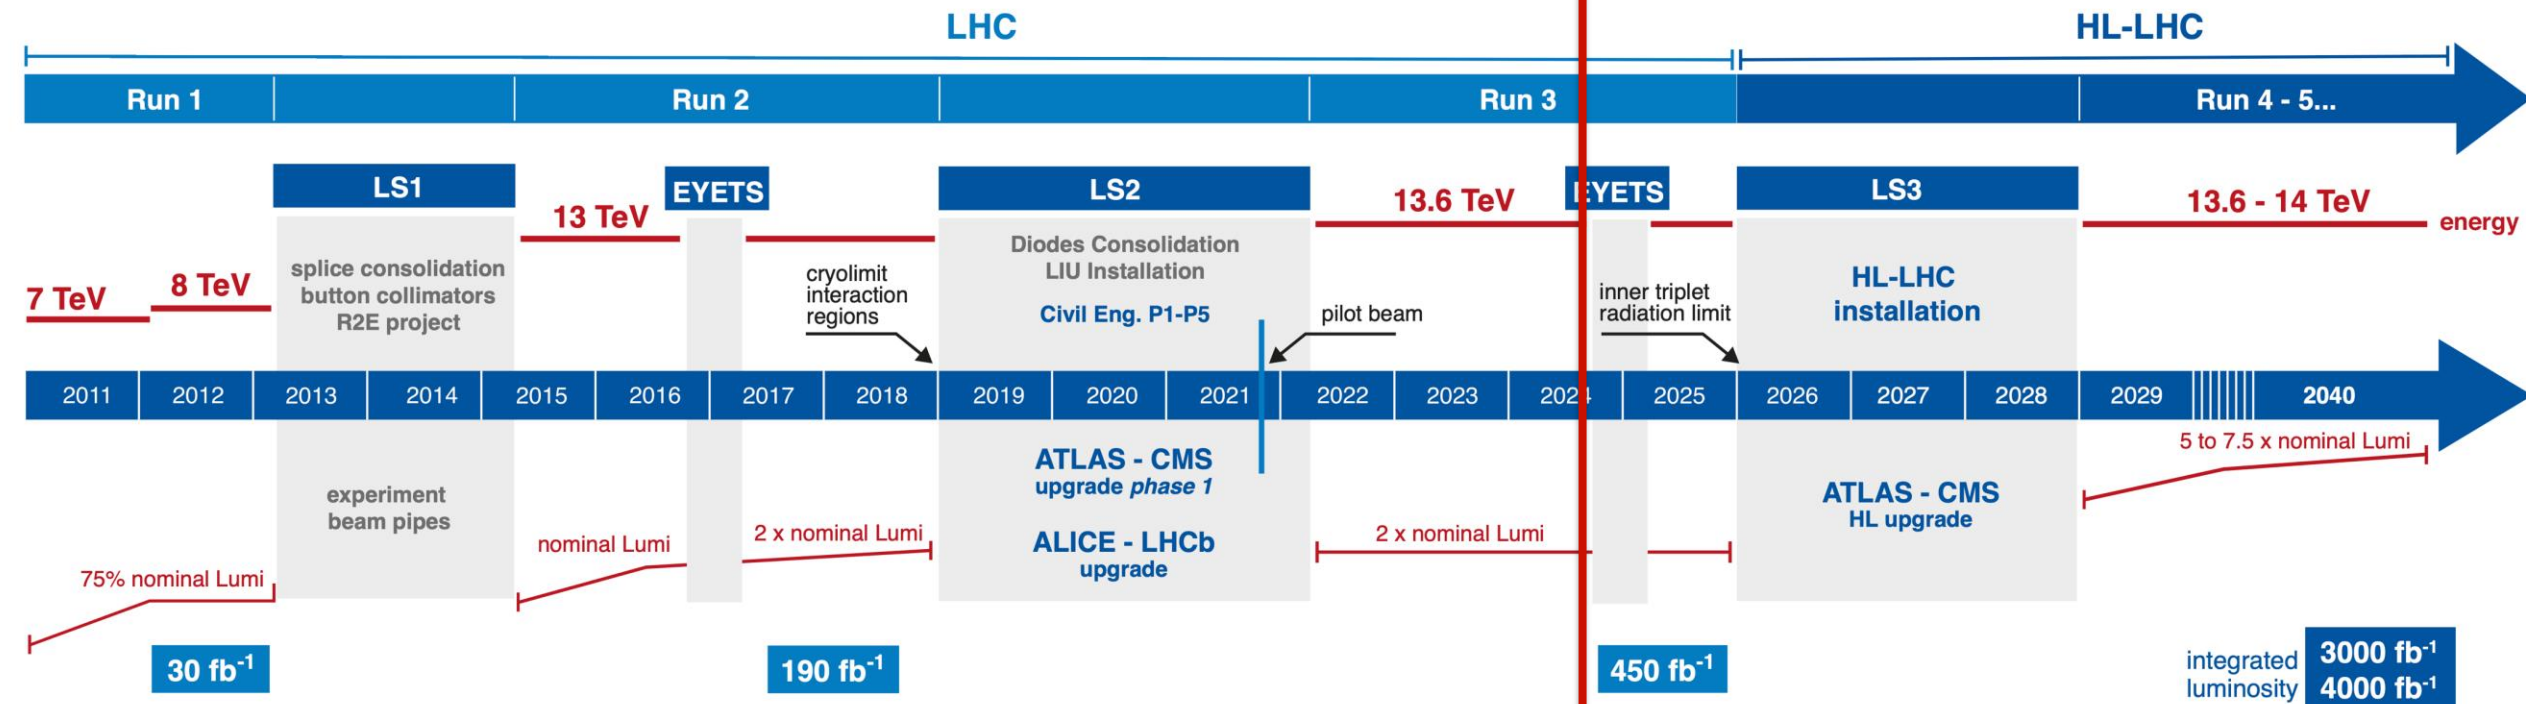

M. Modena and M. Mendes

Underground Civil Engineering Excavation work was completed during LS2!

LHC / HL-LHC Plan

Run3 started with excellent performance in July 2022

Second Year of Run3 cut short due to leak in Pt8 Triplet magnet bellow

2024 run has started with new partial RP optics (triplet irradiation mitigation)

E-cloud still major limitation for allowing maximum number of bunches (cryo capacity)

Electron Cloud: Persisting into HL-LHC period

- Dealing with electron cloud

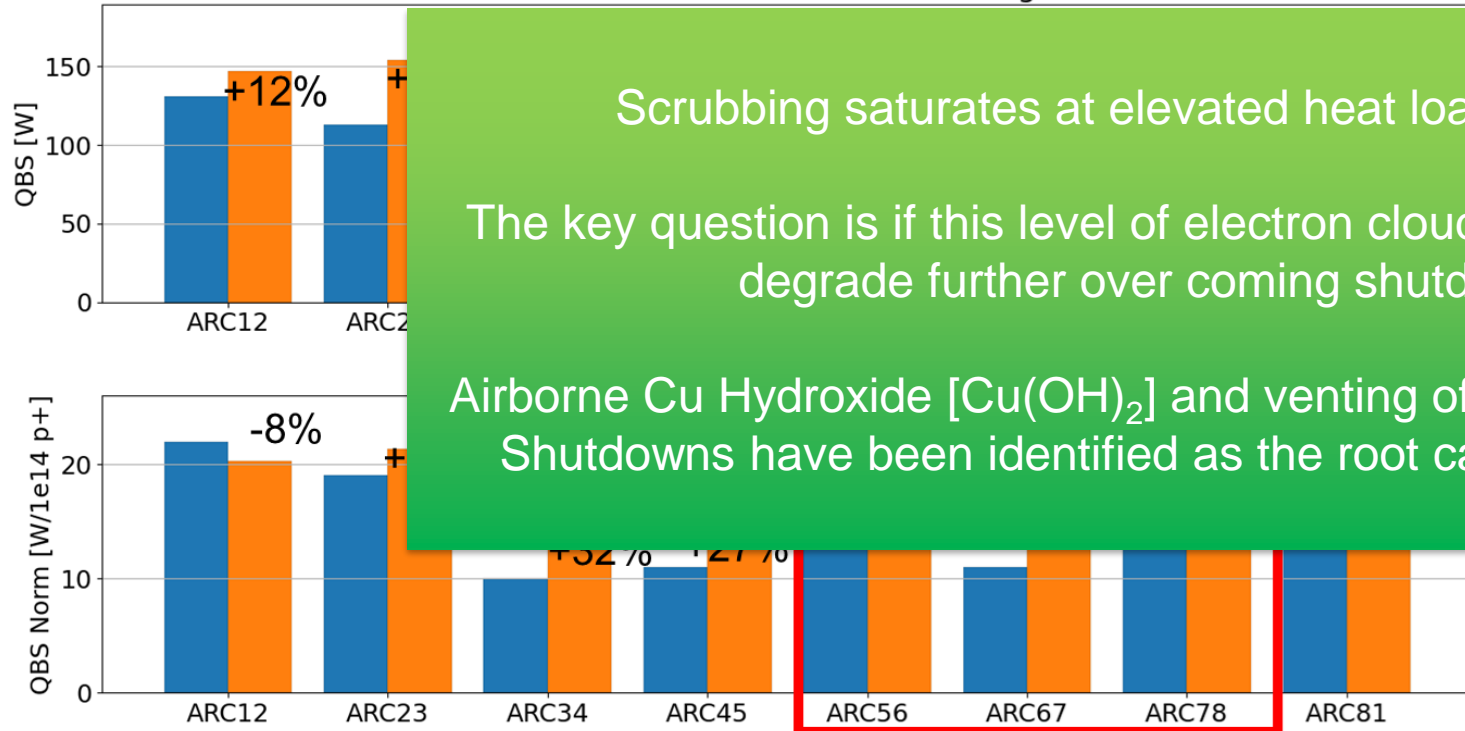

- Sector 7-8 emerged degraded from LS2, determining heat load limitation of LHC

Fill #6675 (2018)

Fill #8471 (2022)

ARC BS half-cell Heat Load average

Scrubbing saturates at elevated heat load levels [e.g. S78]!

The key question is if this level of electron cloud remains stable or if it will degrade further over coming shutdown period?!

Airborne Cu Hydroxide [Cu(OH)₂] and venting of the apertures during Long Shutdowns have been identified as the root cause for this degradation

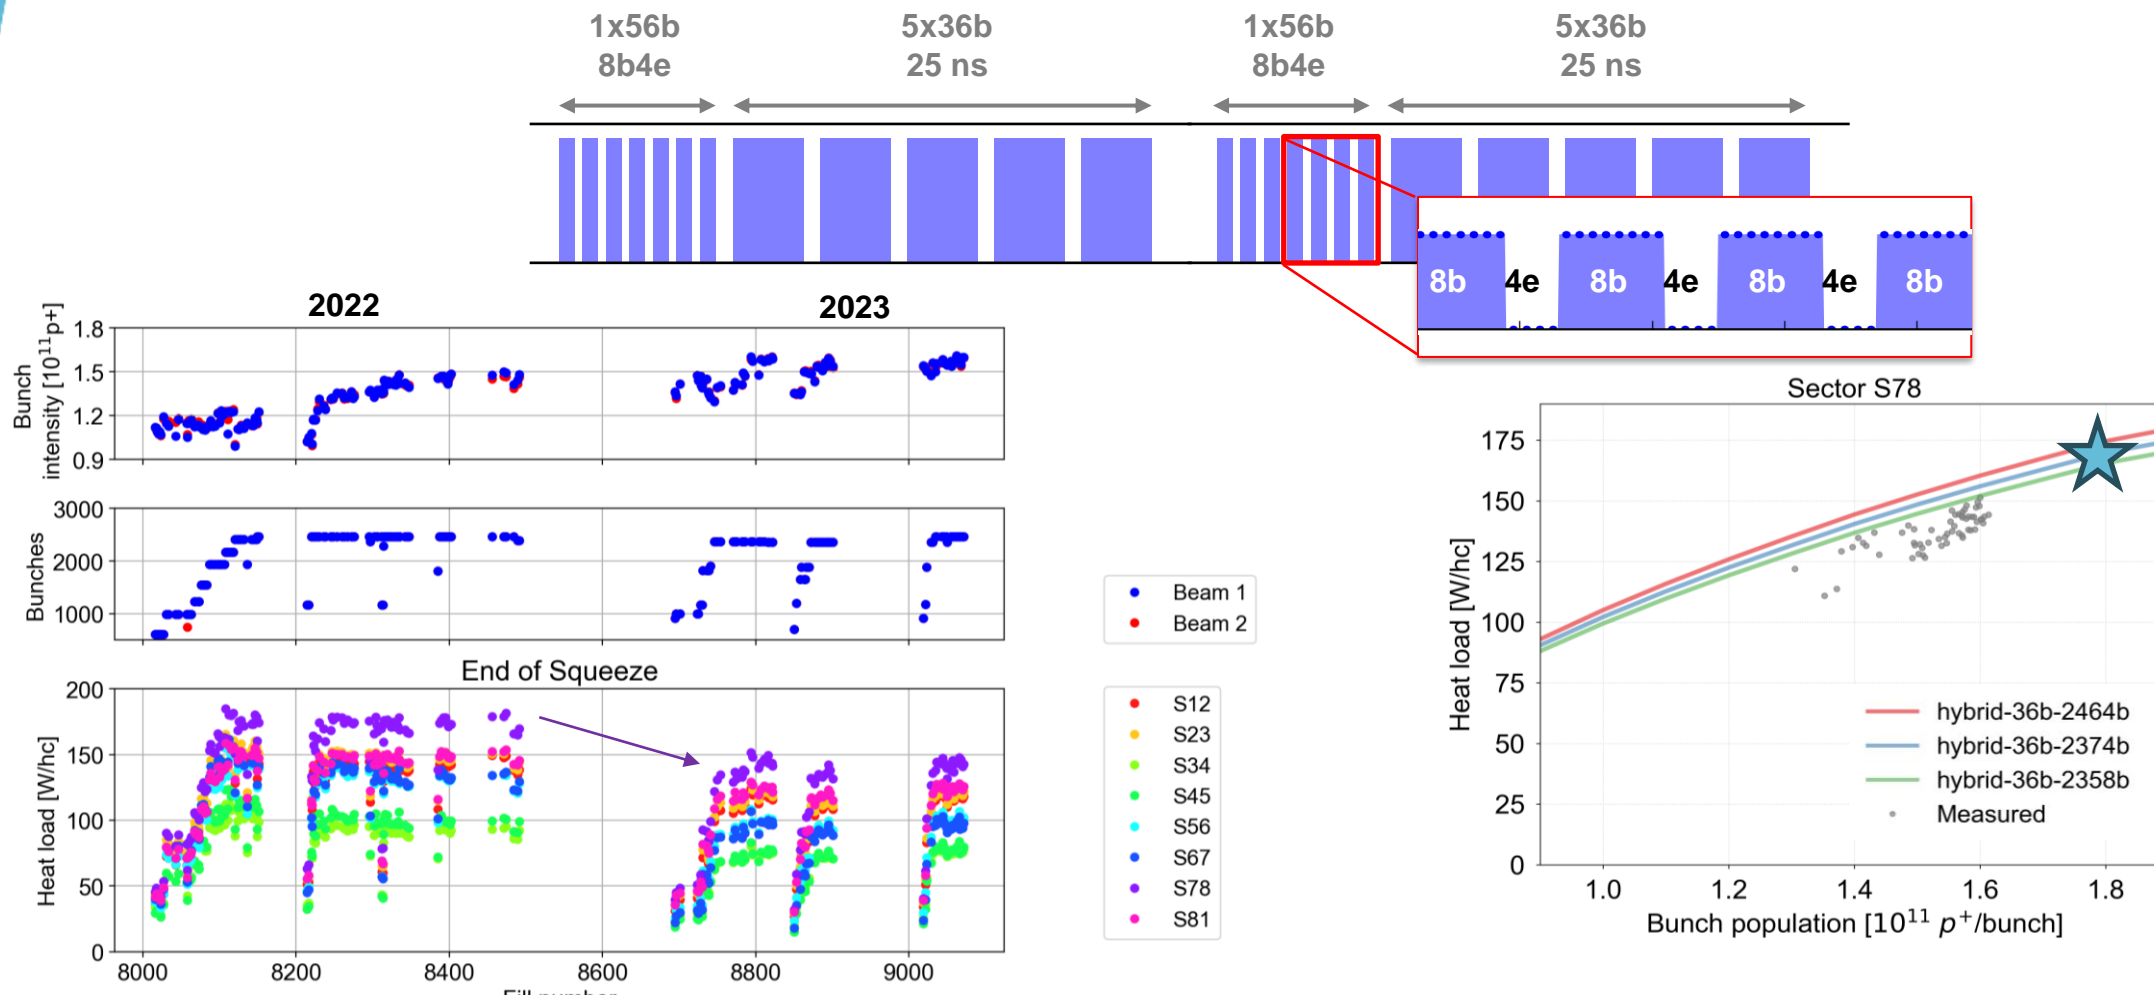

typical e⁻ densities ~10¹² e⁻/m⁻³

(2013-2015)
degradation of S23 & S78 & S81
(2019-2022)

- Provoked significant degradation of heat loads in S56 & S67 & S78

Heat load reduction in LHC with hybrid scheme

- Hybrid filling scheme for e-cloud suppression for proton physics in 2023 (first time!). Reduced number of 25 ns bunches in 2024
 - Total intensity vs heat load optimised with trains mixing 8b4e and 25 ns (5x36b)
 - ~20% reduction in heat load per bunch allowed smooth operation with up to 1.6×10^{11} p/b
 - Sufficient margin in heat load for increasing intensity to 1.8×10^{11} p/b (limited by other devices)

e-cloud: Mitigation Options for HL-LHC

- **Beam stability** is also degraded
→ one needs to address the root cause and not only the heat load with e.g. cryogenics upgrade.
- Ideal cure: **in situ surface treatment** (see *V. Petit*, [LHC Chamonix workshop](#), 23/01/2023)
 - Plasma-assisted CuO reduction and carbon recovery (PE-CVD)
 - Carbon coating (10-20 nm) by sputtering (PVD)

P. Costa Pinto

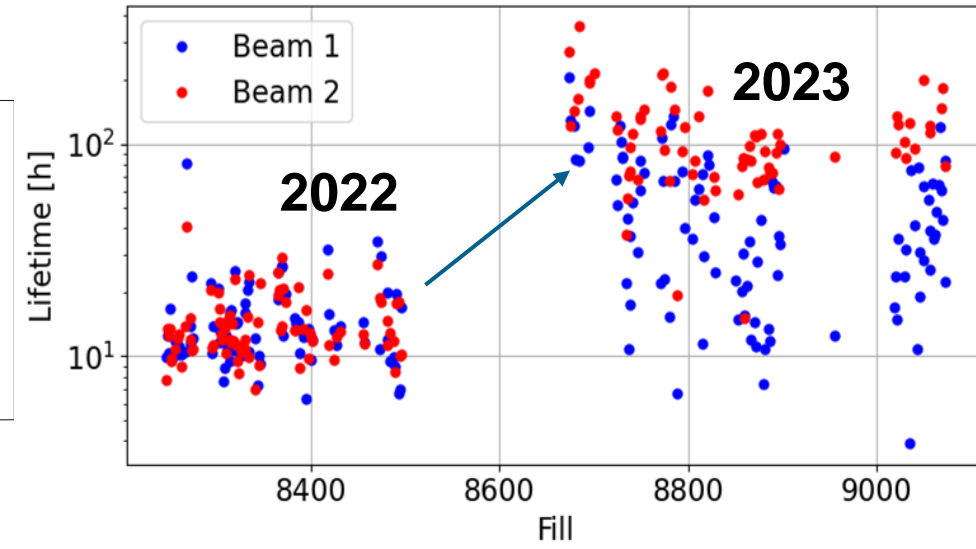

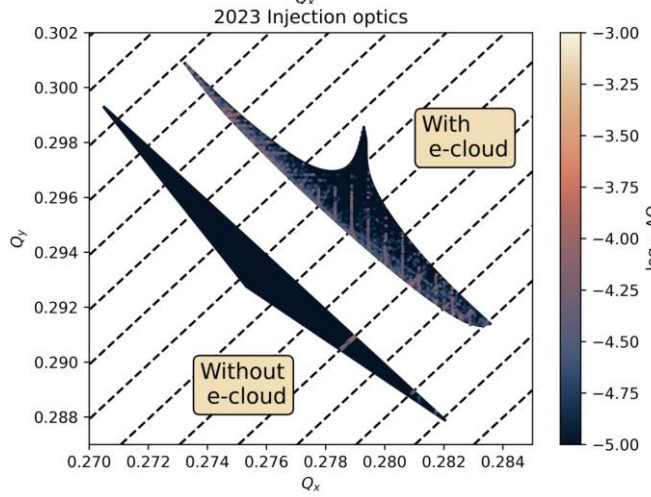

In-situ treatment tool testing and
personnel training on mockup

Consolidation Project proposed
(see *M. Lamont*, [LHC “Chamonix” workshop
summary](#), 25/03/2023)

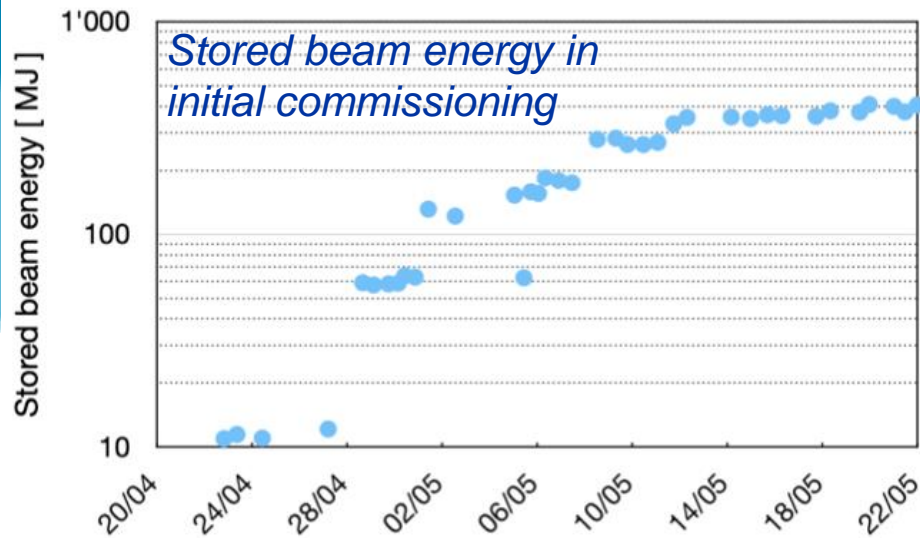

LHC optics corrections for incoherent e-cloud effects

- LHC 2023 Injection optics modified to suppress **synchro-betatron resonances** excited by arc octupoles and e-cloud in quadrupoles – improving beam lifetime!

LHC proton Run 2023: collimation performance

- LHC stored beam energy in 2023 exceed **400MJ** at 6.8 TeV – new **record!**
- Excellent performance of collimation cleaning systems
 - Ensured safe operation and high availability in all operational phases
 - In particular, during **complex 2023 β^* levelling scheme!**
 - **Cleaning inefficiencies** often below the 10^{-4} level
- **New HL-LHC collimators** fully deployed in operation: low-impedance collimators, TCLD dispersion suppressor collimators (ions), crystal collimation scheme for high- β^* run, ...
- **Big effort** to ensure system commissioning, including all special runs, and to validate/monitor performance.

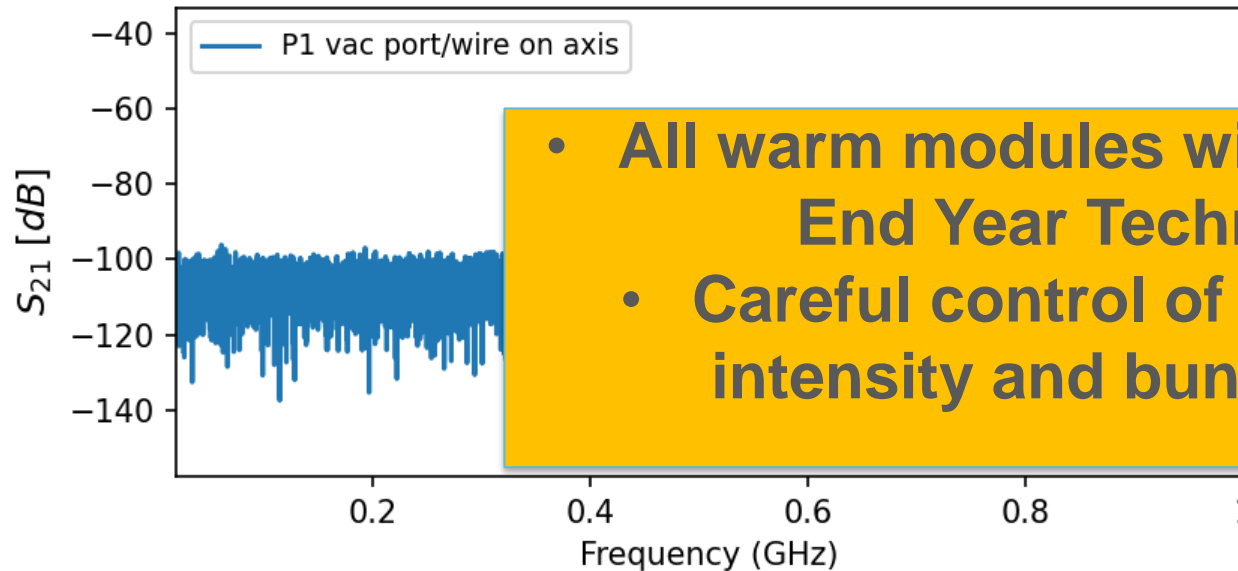

Example: B2H cleaning performance along the cycle

Studies on LHC RF fingers

Identification of the possible mechanism of failure: beam impedance induced heating due to field leakage from RF fingers

Wire measurements

Field leakage measured and confirmed by simulations

- All warm modules will be consolidated during End Year Technical Stops of Run3
- Careful control of bunch length for given intensity and bunch pattern is essential

More critical situation for larger module diameter, the (resonances driven at lower frequencies and induce higher power loss)

Simulations also suggest that beam offset and defects in RF finger production can magnify leaked modes

RP optics

The IT lifetime does not only depend on integrated performance, but also on

(i) X-angle plane and polarity (& magnitude)

→ peak dose at 0°, 90°, 180° or 270°

(ii) Beam-screen orientation

→ H & V planes “shielded” differently

(iii) IT polarity since most debris positively charged

→ exported onto H or V plane

Optics with Reversed Polarity (RP) of the triplet do exist, e.g. with Q4 switched off, and nominal quad polarity restored as of Q5

→ Enabling an increase of triplet longevity by 25%

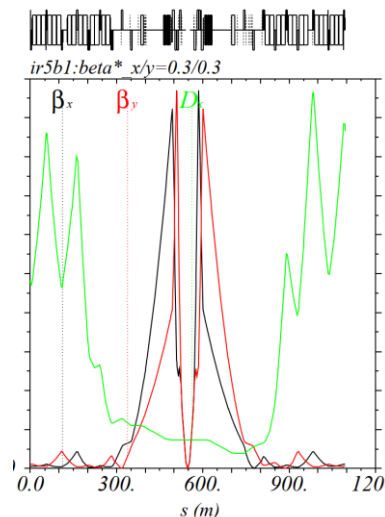

Peak dose after 300 fb⁻¹
(ATLAS X-angle polarity reversal not included).

Courtesy of F. Cerutti

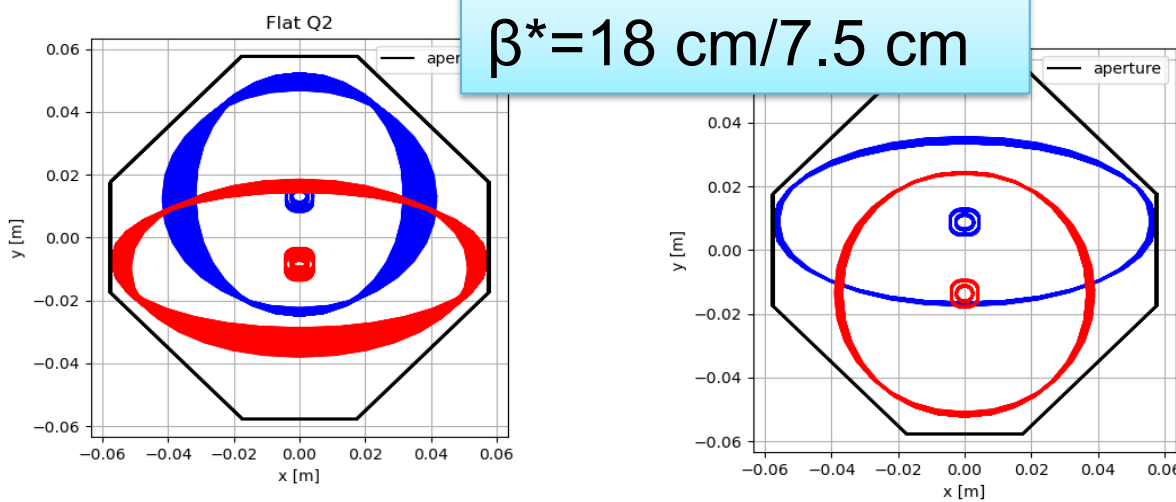

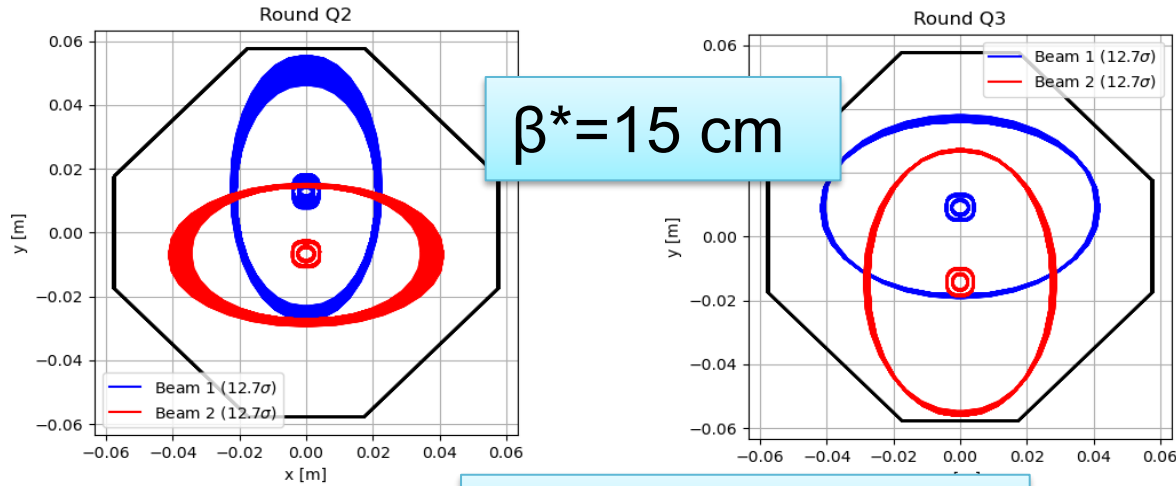

Nominal 30 cm
(FDF triplet + Q4 ON)

RP 30 cm
(DFD triplet + Q4 OFF)

HL-LHC flat optics

$$L_{lev.} = 5 \times 10^{34} \text{ cm}^{-2}/\text{s}$$

# of bunches	$\beta^*_{x,y}$ [cm]	$L_{int} [\text{fb}^{-1}]$ (Δ [%])	ppb _{end} Leveling ppb _{end} [10 ⁻¹¹]	Pile-up	Fill length [h]

Gain of flexibility helps to optimize involved configurations:
e.g. comparing round/flat optics DA octupoles vs. tune in HL-LHC in ADJUST with 8b4e filling scheme

ROUND OPTICS

HL-LHC v1.6. E=7.0 TeV. $N_b \approx 2.3 \times 10^{11}$ ppb,
 $L_{1/5} = 2.63 \times 10^{34} \text{cm}^{-2}\text{s}^{-1}$, $L_2 = 1.56 \times 10^{30} \text{cm}^{-2}\text{s}^{-1}$, $L_8 = 1.51 \times 10^{33} \text{cm}^{-2}\text{s}^{-1}$
 $\beta_{x,1}^* = 1 \text{ m}$, $\beta_{y,1}^* = 1 \text{ m}$, polarity $IP_{2/8} = 1/1$
 $\Phi/2_{(10)} = 250 \mu\text{rad}$, $\Phi/2_{S(V)} = 250 \mu\text{rad}$, $\Phi/2_{2,V} = -170 \mu\text{rad}$, $\Phi/2_{8,V} = 170 \mu\text{rad}$
 $\sigma_z = 7.61 \text{ cm}$, $\epsilon_n = 2.0 \mu\text{m}$, $Q = 15$, $C^- = 0.001$
 8b4e_1972b_1960_1178_1886_224bpi_12inj. Bunch 89.

FLAT OPTICS

HL-LHC v1.6. E=7.0 TeV. $N_b \approx 2.3 \times 10^{11}$ ppb,
 $L_{1/5} = 2.43 \times 10^{34} \text{cm}^{-2}\text{s}^{-1}$, $L_2 = 1.55 \times 10^{30} \text{cm}^{-2}\text{s}^{-1}$, $L_8 = 1.55 \times 10^{33} \text{cm}^{-2}\text{s}^{-1}$
 $\beta_{y,1}^* = 0.7 \text{ m}$, $\beta_{x,1}^* = 2.8 \text{ m}$, polarity $IP_{2/8} = 1/1$
 $\Phi/2_{(10)} = 250 \mu\text{rad}$, $\Phi/2_{S(V)} = 250 \mu\text{rad}$, $\Phi/2_{2,V} = -170 \mu\text{rad}$, $\Phi/2_{8,V} = 170 \mu\text{rad}$
 $\sigma_z = 7.61 \text{ cm}$, $\epsilon_n = 2.0 \mu\text{m}$, $Q = 15$, $C^- = 0.001$
 8b4e_1972b_1960_1178_1886_224bpi_12inj. Bunch 89.

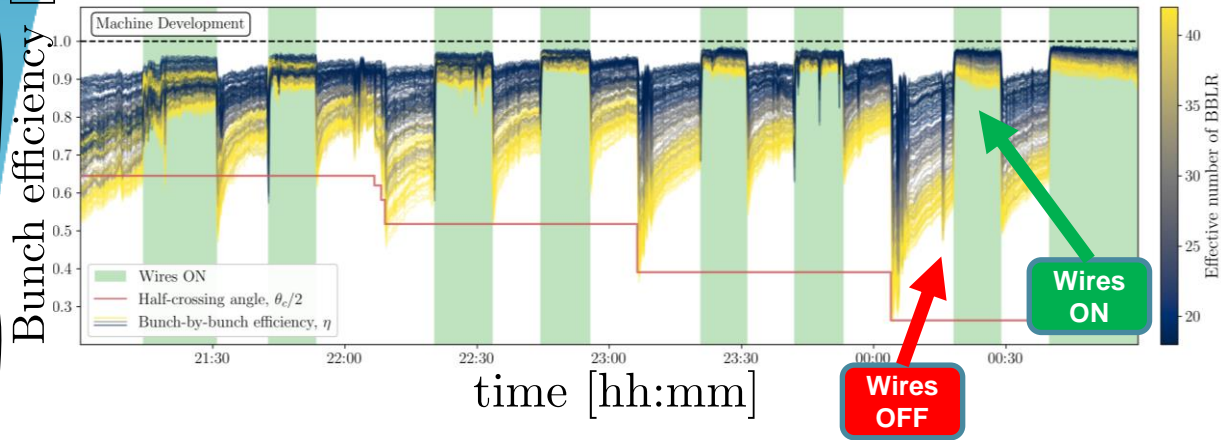

Improving toolbox with more advanced predictions:
e.g. studies of bunch-by-bunch DA
 → important for hybrid filling schemes

Beam-beam compensation using DC wires

From MD...

...to 2023 operation

From Run 3 to Run 4

≈9 m space between Q5-Q4 reserved for HL wires for both sides of IR1/5

First Run 4 Design

More on [HL-LHC Satellite Meeting, Vancouver, 2023](#)

Advanced beam dynamics studies: halos in LHC

Spread of halo content across bunches

- Continued effort to understand potential halo limitations to LHC and HL-LHC performance
 - In 2023, severely jeopardized by MD available time with proton beam.
- Characterization bunch-by-bunch could be achieved**
- Improved understanding of the effect from long-range wires
- Investigation on novel chaos indicators tools for accelerator physics
 - Initial GPU studies for Xsuite

First deployment of crystal collimation

Crystal collimation scheme (illustrative)

Built as a part of the HL-LHC upgrade (WP5) and installed in LS2 + YETS2022

4mm-long LHC crystal

First ion beams with crystals on Sep. 23rd.

LHC Page1	Fill: 9192	E: 6799 Z GeV	t(SB): 00:11:12	26-09-23 19:58:10
ION PHYSICS: STABLE BEAMS				
Energy:	6799 GeV	I B1: 1.63e+12	I B2: 1.60e+12	
Beta* IP1:	0.50 m	Beta* IP2: 0.50 m	Beta* IP5: 0.50 m	Beta* IP8: 1.50 m

- First operational deployment of crystal collimation scheme
 - Completed upgrade of IR7 system, 4 new crystals (after some hiccups)
 - Special run at high- β^* also profited for low backgrounds at $\beta^* = 3\text{km} / 6\text{km}$!
- **Excellent cleaning performance achieved with lead beams at 6.8 Z TeV !**
 - Standard collimation **improved by more than a factor 5**
- Some issues with **stability of the optimal angular position** to be addressed for future lead ion runs

LIU beams arrived in 2023!!!! (almost)

See H. Bartosik's slides in [216th HL WP2 meeting](#)

year	Intensity at FT [p/b]	# of bunches	Batch spacing [ns]	Bunch length [ns]	Beam type	Date
2023	2.2e11	4 x 72	200	1.6	Standard	13.06.
2023	2.0e11	2 x 56	250	1.6	8b4e	05.04.
2023	1.8e11	56 + 5 x 36	200	1.6	hybrid	19.05.

LHC Integrated Luminosity 2024

[Generated at: 2024-09-02 06:27:21]

On Sunday 1 September, the LHC's integrated luminosity for Run 3, that started in 2022, so far equalled that of Run 2 (2015 – 2018).

Year	Average Integrated Luminosity ATLAS-CMS [fb ⁻¹]
Run 1 total:	29.2
Run 2 total:	159.8
Run 3 total (so far):	160.1
Total:	349.1

Latest Run 4 baseline

CERN-ACC-2022-0001

Run length of 3.5 years, $\beta^*=20$ cm, with HEL, no MS10, primary coll. at 8.5σ ,

integrated luminosity: $550 \text{ fb}^{-1} = 21 + 85 + 205 + 242 \text{ fb}^{-1}$ (3% below HL target: 250)

Scenarios to be refined according to new possible schedule (LS3 shift/extension, Run4 start

Towards an update of Run 4 scenario (protons)

- e-cloud is likely to limit the number of bunches in Run 4 → **8b+4e** or hybrid scheme needed, plus **flat optics** (~ +5% luminosity, and help with crab cavity impedance):

Assumptions:
 $\beta^*_{x,y} = 18, 9$ cm
 Half crossing angle = 250 μ rad
 160 days,
 eff.=50%

# of bunches	PU	Integrated Lumi [1/fb] (Δ [%])		Feasibility from		
				e-cloud	Beam Dynamics	Experiments
2748 (25ns)	132	257	(0%)	No	Yes	Yes
	200	318	(+23%)	No	To be studied	Yes
2200 (hybrid)	140	217	(-16%)	Maybe	Yes	Yes
	200	257	(0%)	Maybe	Studies ongoing	Yes
1972 (8b+4e)	140	194	(-24%)	Yes	Yes	Yes
	200	230	(-10%)	Yes	Yes for DA	Yes
1972 2.5x10 ¹¹	200	253	(-1%)	Exceeding LIU and HL-LHC goals, but worth investigating if possible		

Preliminary input from various teams rather positive, but many studies still needed.

Filling schemes for Run 4 under consideration

1. **2760 bunches:** Nominal, but not fully guaranteed even by fixing 100 half cells
2. **2X00 bunches:** Alternative in case of further degradation of SEY (under study).
3. **1972 bunches:** Pure 8b4e, very robust.

Integrated and leveled luminosity versus # of bunches & PU

- PU=200
- PU=180
- PU=160
- PU=140

Nominal PU is between 131-140.

If number of bunches is limited detectors could request larger PU to integrate more luminosity.

Assuming for now Flat optics 18,9cm for all cases

LHCb upgrade II (in Run 5)

LHCb upgrade II, $L_{\text{lev}} = 1.5 \times 10^{34} \text{ cm}^{-2} \text{ s}^{-1}$ would reduce ATLAS/CMS integrated luminosity by 2% for both Nominal and Ultimate.

Reduced lifetime from increased beam-beam not included here → **Need to develop a fully new operational scenario with LHCb II.**

Increased burn-off in IP8 causes bunch-by-bunch variations, under study.

Collaborations: MQXFA - CA01

- **First cold mass reaching performance** – no retraining after thermal cycle (not shown in the plot)
- Welded before Welding Parameter Specification approval – derogation with CERN Safety Unit
- Issues (2) with QH and V-tap – acceptable for IT-string ([EDMS 2769128](#)) ([EDMS 2883868](#)) → will require repair later
- Issue with leaks tightness test – Instrumentation ([EDMS 2905753](#))

Quench performance of LQXFA01 (Test eng. B. Yahia, WPE: G. Ambrosio, S. Feher, et al.)

Recent Milestones

- MQXFB02 reached nominal + 300A @ 1.9K but limited @ 4.5K

Status MQXFB – Q2: Cryo-Module Assembly at CERN - 03

- MQXFBP3 test at CERN
 - Nominal +300A @ 1.9K and TC ✓
- MQXFB02 test at CERN
 - nominal +300A @ 1.9K and TC ✓
- Limitation @ 4.5K, but temp margins compatible with ultimate operation energy @ 1.9K
- Both P3 and B02 went through thermal cycles without degradation
- MQXFB03 reached nominal 4.5K!
- On Track for Series Production of Nb₃Sn HL-LHC Triplet Quadrupole Magnets

D1 Series Production Validation @ KEK

Successful upgrade of the KEK test station ✓

Production of MQXF5 Ongoing @ Hitachi

Half of the coil production is completed

THE STRING INGREDIENTS ARE GETTING READY

- Dates given in schedule change request, [EDMS 2898265](#)
 - Q1: magnet cold mass being welded → Available in **September 2024**
 - Q2a: MQXFBP2b completed → **On SM18 Testbench** → Available April 2024
 - Q2b: MQXFBP3b completed → **Available for Testbench Jan.** → April 2024
 - Q3: magnet being prepared for shipment to CERN → Available July 2024
 - CP cryostating Phase II **ongoing** → Available August 2024
 - D1 cryostating completed → **Available for Testbench** → Available March 2024

Recent Milestones

- February 2023: He Vessel welding for 1st Series DQW Crab Cavity

3rd test beyond the specification with 100 μm additional chemistry of HOMs & 120⁰deg vacuum bake

Industrial DQW Series (RI)

- 1st pre-series jacketed cavity with excellent results, metrology to be finalized before acceptance
- 2nd cavity in metrology and cold tests soon
