Introduction: History of Anti-matter Discovery

Science 328, 58 (2010)

Nature 473, 353 (2011)

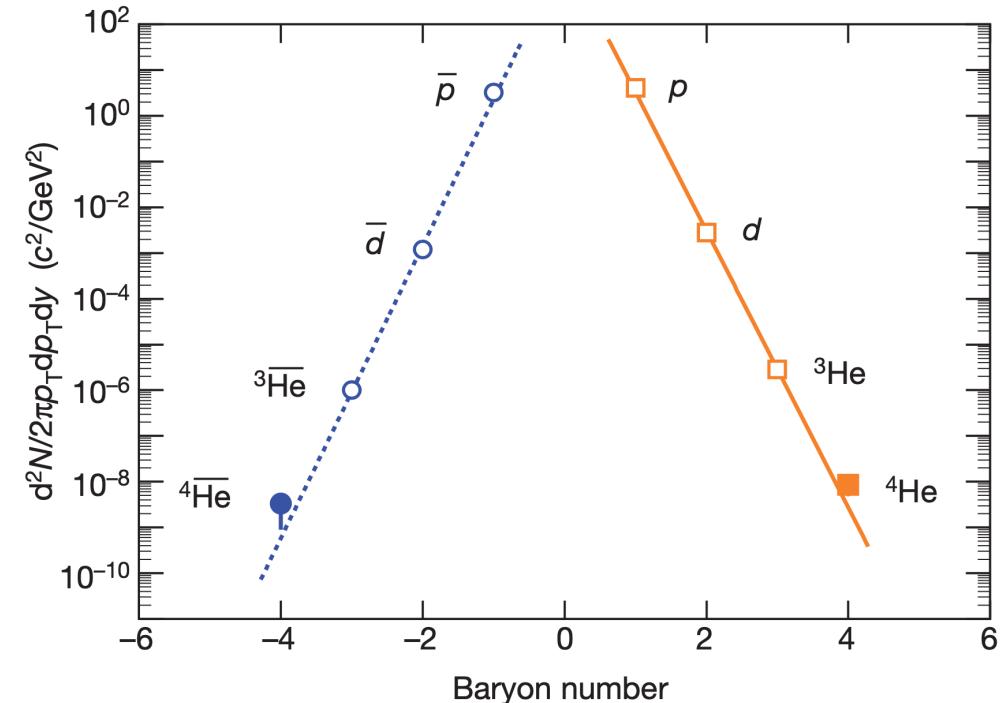

Introduction: Anti(hyper)nucleus Production

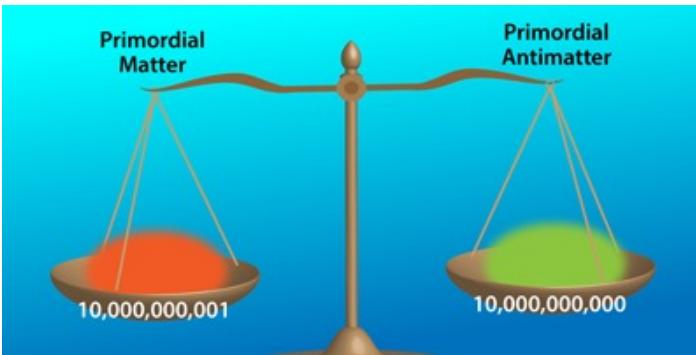

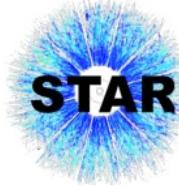

Nature 473, 353 (2011)

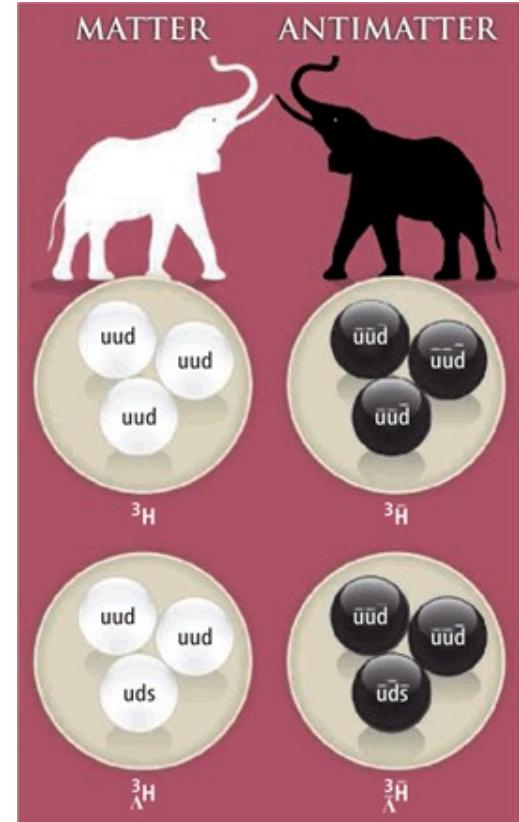

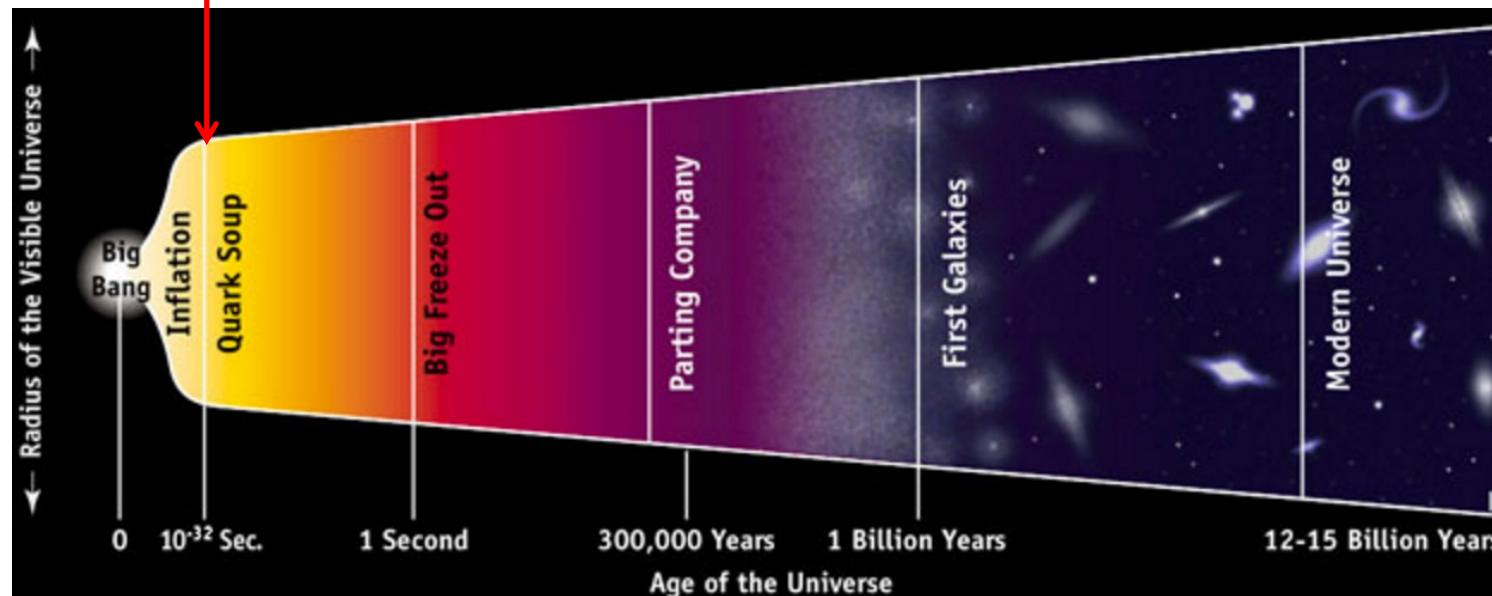

- Anti(hyper)nuclei binding energy \sim several MeV / nucleon
- QGP temperature \sim several hundred MeV
- \Rightarrow They are produced by coalescence of antibaryons in the last stage of the collision

Introduction: Matter-antimatter Asymmetry in the Universe

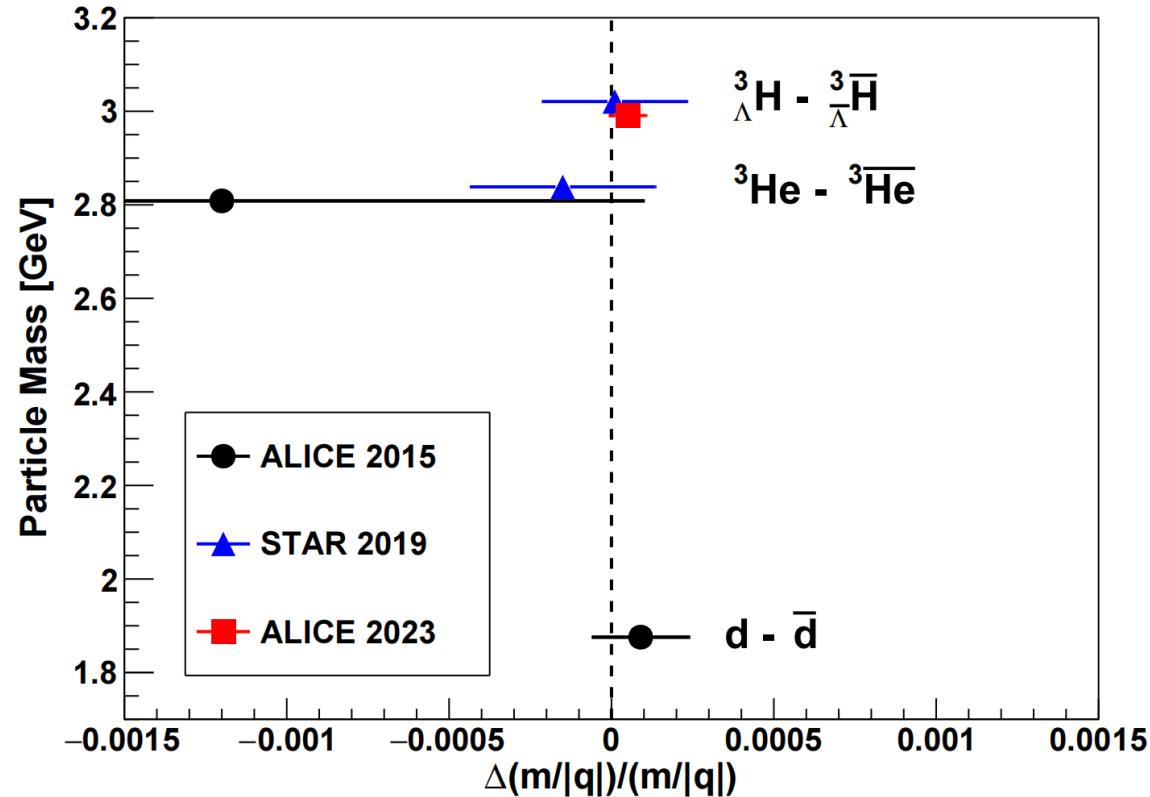

- Matter-antimatter asymmetry in early universe is the precondition for the existence of the matter world today
- The source of this asymmetry is still not clear

CPT theorem \Rightarrow
Symmetry of matter-
antimatter properties

Introduction: CPT symmetry test with heavy-ion collisions

$$\frac{\tau_{^3\Lambda\text{H}} - \tau_{^3\bar{\Lambda}\text{H}}}{\tau_{^3\Lambda\text{H}}} = [3 \pm 7(\text{stat}) \pm 4(\text{syst})] \times 10^{-2}$$

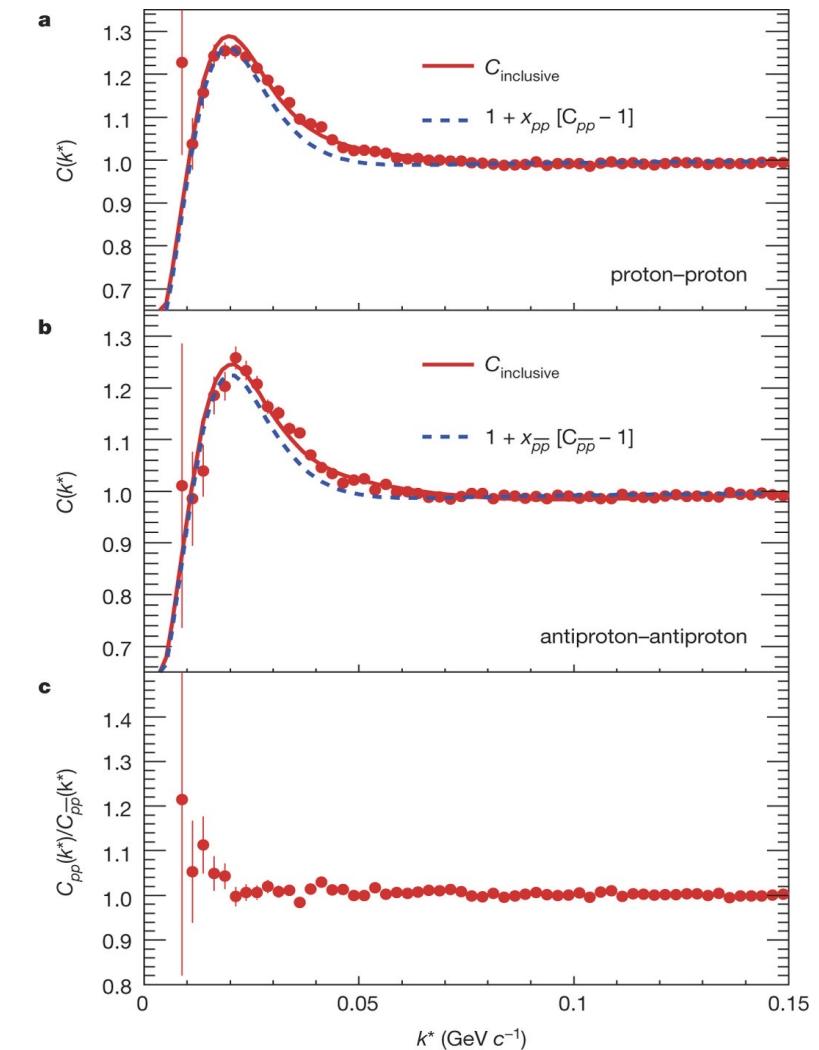

Nature Phys. 11 (2015) 10, 811-814
Nature Phys. VOL 16, April 2020, 409–412
PHYSICAL REVIEW LETTERS 131, 102302 (2023)

- No significant mass or binding energy difference between d & \bar{d} , ^3He & $^3\bar{\text{He}}$, $^3\Lambda\text{H}$ and $^3\bar{\Lambda}\text{H}$
- No significant lifetime difference between $^3\Lambda\text{H}$ and $^3\bar{\Lambda}\text{H}$

Introduction: CPT symmetry test with heavy-ion collisions

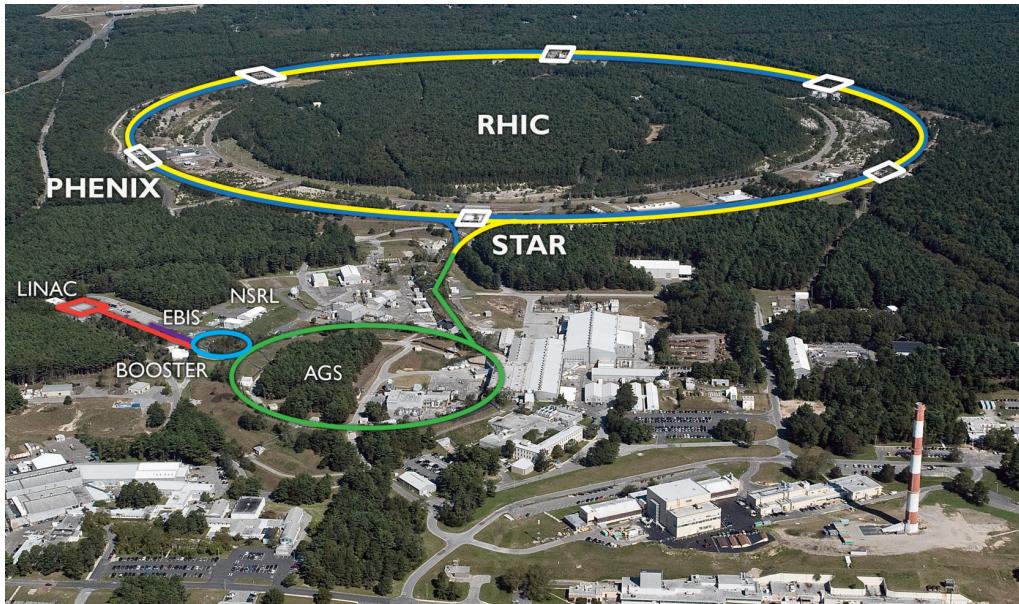

- No difference between p-p and $\bar{p}-\bar{p}$ correlation functions
 - \Rightarrow No difference between p-p and $\bar{p}-\bar{p}$ interactions

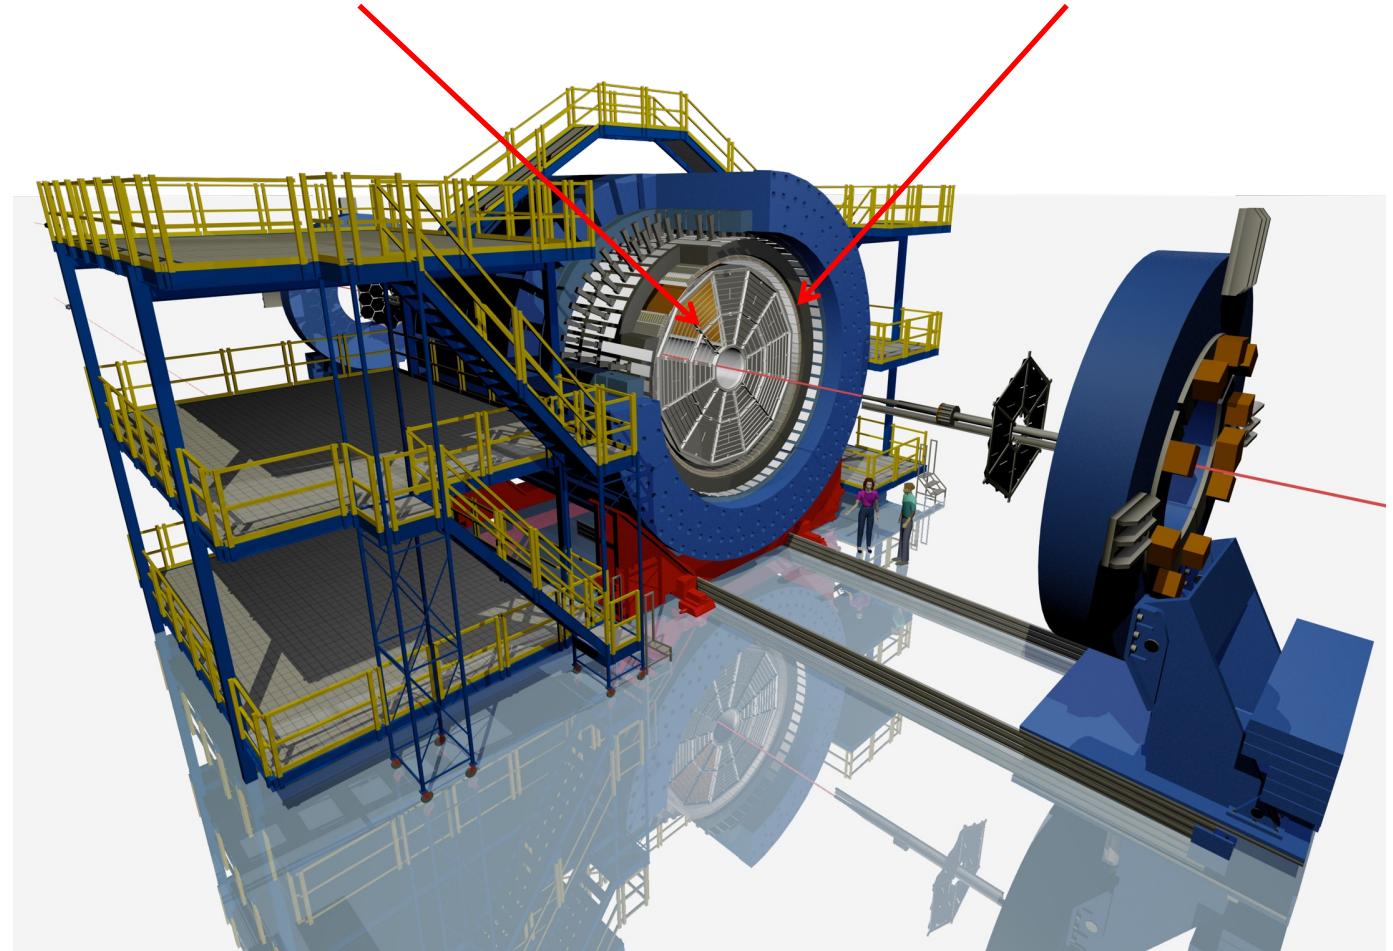

Nature volume 527, pages 345–348 (2015)

RHIC-STAR

Time Projection Chamber

- tracking $\Rightarrow p/Z, dE/dx$

Time-Of-Flight detector

- TOF + $p/Z + L \Rightarrow m^2/Z^2$

Data Sets

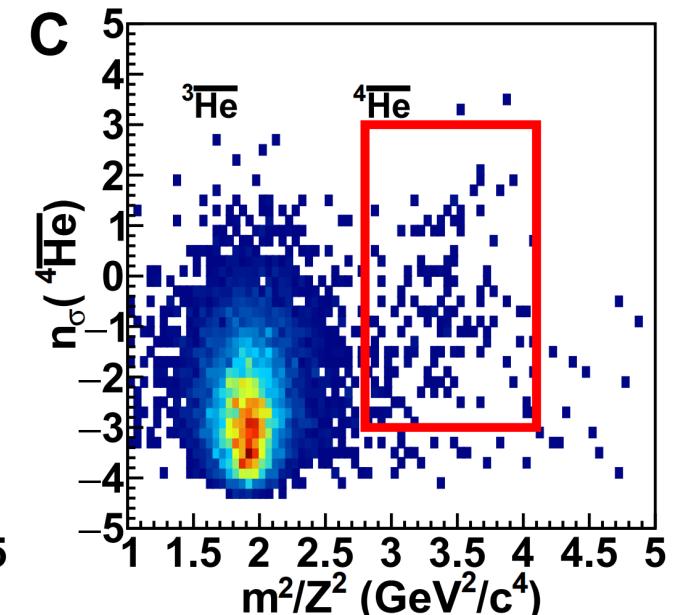

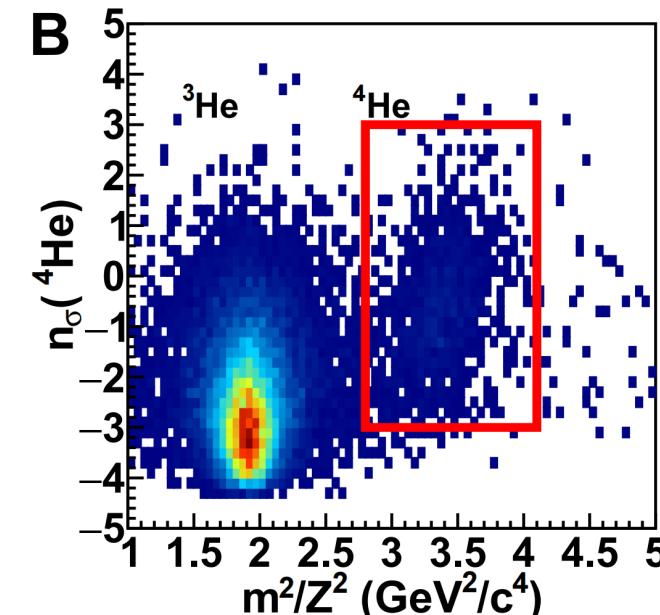

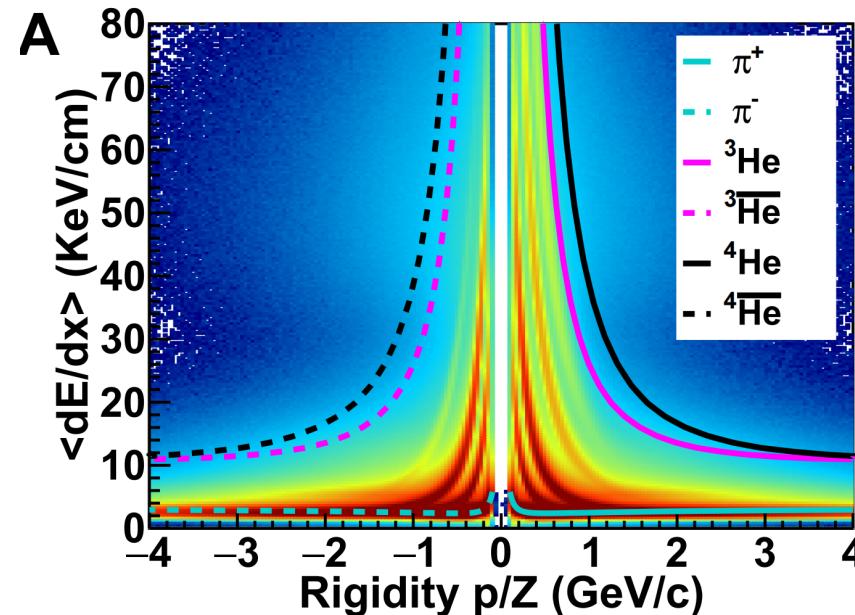

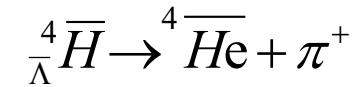

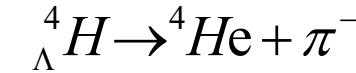

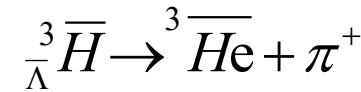

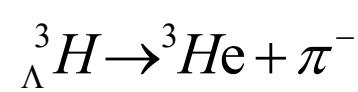

data set	year	N events
AuAu@200 GeV	2010	~606 M
AuAu@200 GeV	2011	~626 M
UU@193GeV	2012	~512 M
ZrZr+RuRu(Isobar)@200GeV	2018	~4.7 B

Trigger:

- Minimum bias trigger
- Central trigger
- Electromagnetic and hadronic triggers
-

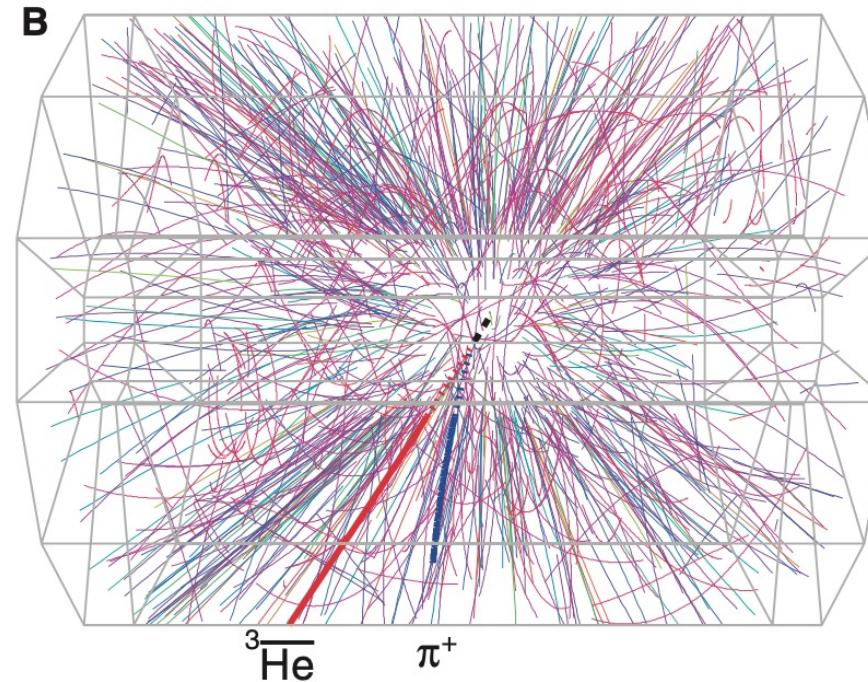

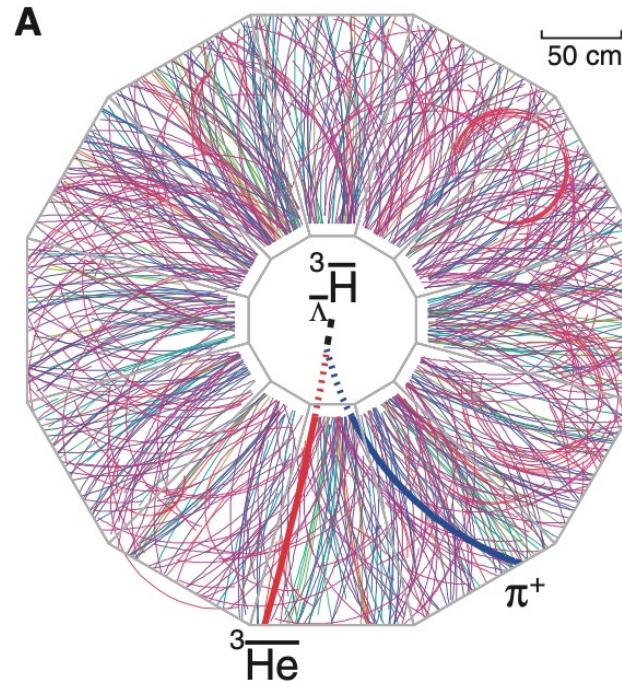

- Use as many triggers as possible to find signal and measure lifetime
- Use minimum bias trigger for production yield ratios measurement

Decay Channels & Daughter Particle Identification

- 3He PID: $(Z < 0 \parallel p > 2.) \text{ && } |n\sigma^{^3He}| < 3 \text{ && } (\text{if TOF matched}, 1 < M^2/Z^2 < 3);$
- 4He PID: $(Z < 0 \parallel p > 2.) \text{ && } |n\sigma^{^4He}| < 3 \text{ && } (|n\sigma^{^3He}| > 3.5 \parallel 2.8 < M^2/Z^2 < 4.1));$
- π PID: $|n\sigma_\pi| < 3;$

Decay Vertex Reconstruction

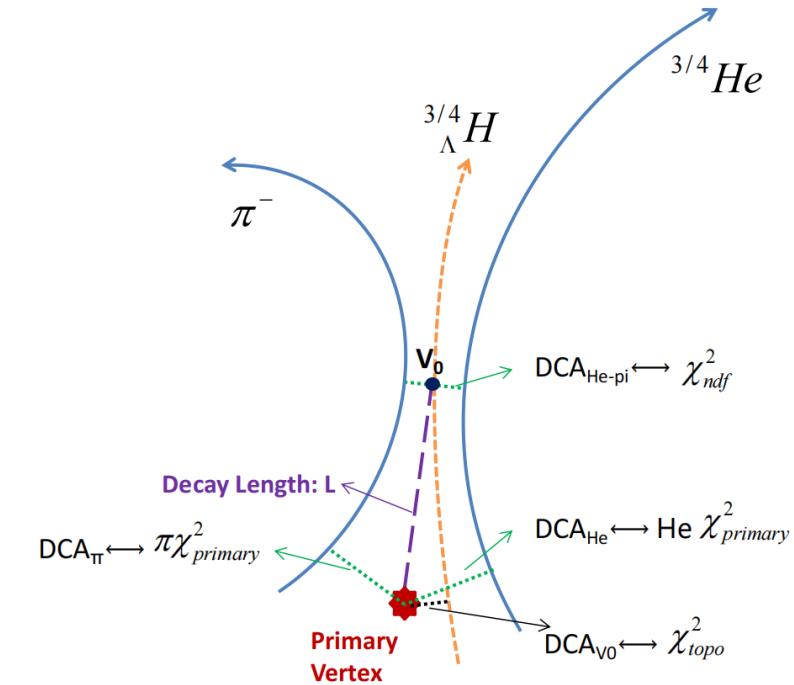

Science 328, 58 (2010)

- KF(Kalman Filter) Particle package for decay vertex reconstruction
- Topology cuts obtained by optimizing $^{3/4}\bar{H}$ significance
 - blind for $^{4}\bar{H}$ and $^{4}\bar{H}$

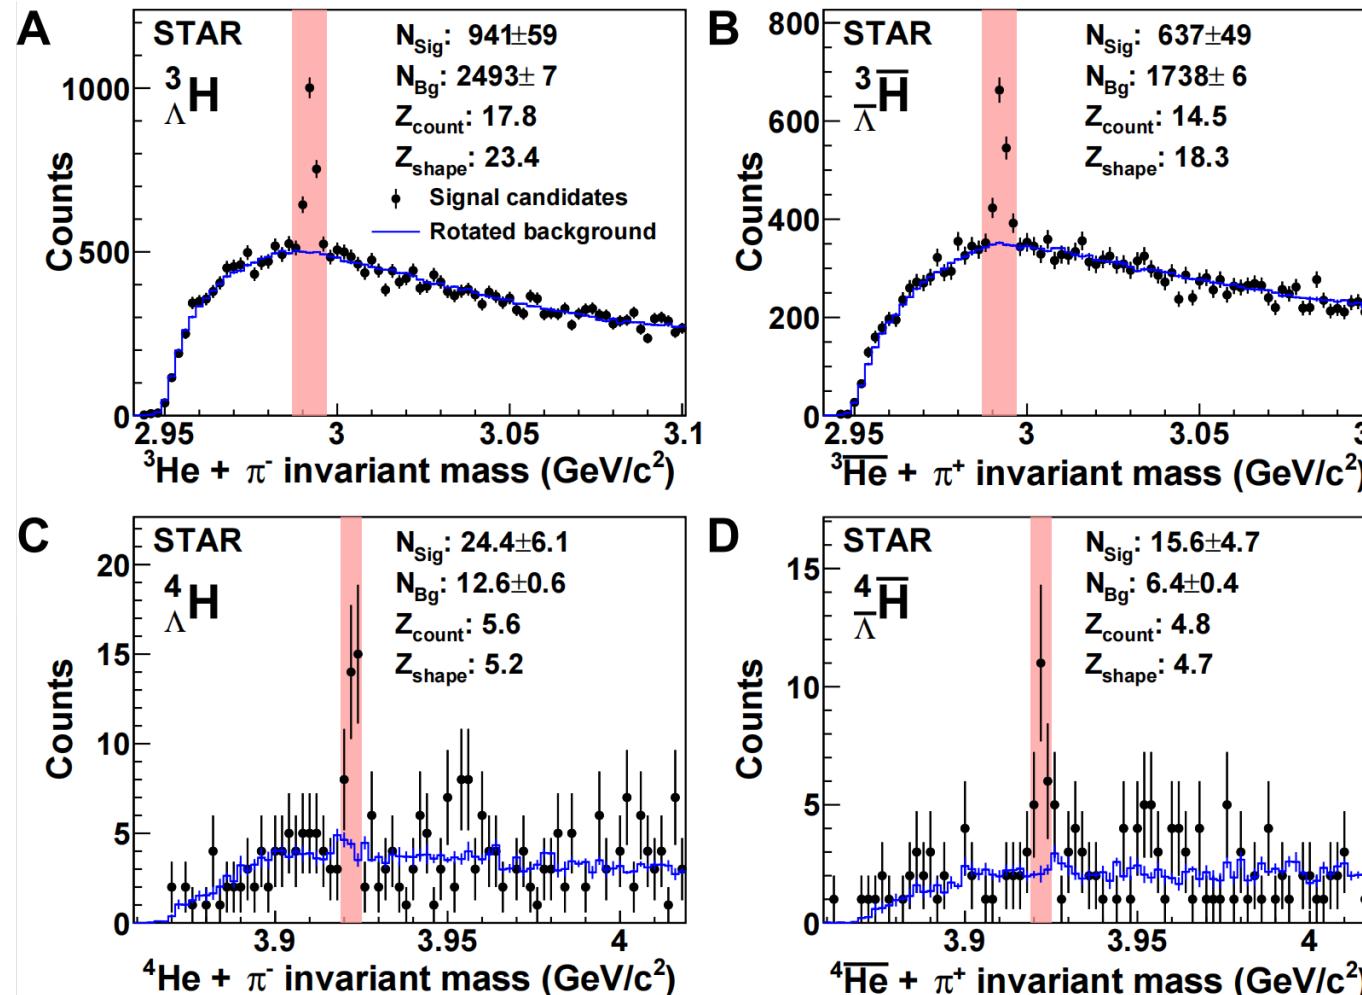

S. Gorbunov and I. Kisiel, CBM-SOFT-note-2007-003, 7 May 2007

M. Zyzak, "Online selection of short-lived particles on many-core computer architectures in the CBM experiment at FAIR," Dissertation thesis, Goethe University of Frankfurt, 2016

Particle	$\chi^2_{\text{prim He}}$	$\chi^2_{\text{prim }\pi}$	χ^2_{ndf}	χ^2_{topo}	L/dL	L	He DCA
$^{3}\bar{H}$ & $^{4}\bar{H}$	<2000	>10	<5	<2	>3.5	>3.4cm	<1cm
$^{3}\bar{H}$ & $^{4}\bar{H}$	<2000	>10	<5	<3	>3.5	>3.4cm	-

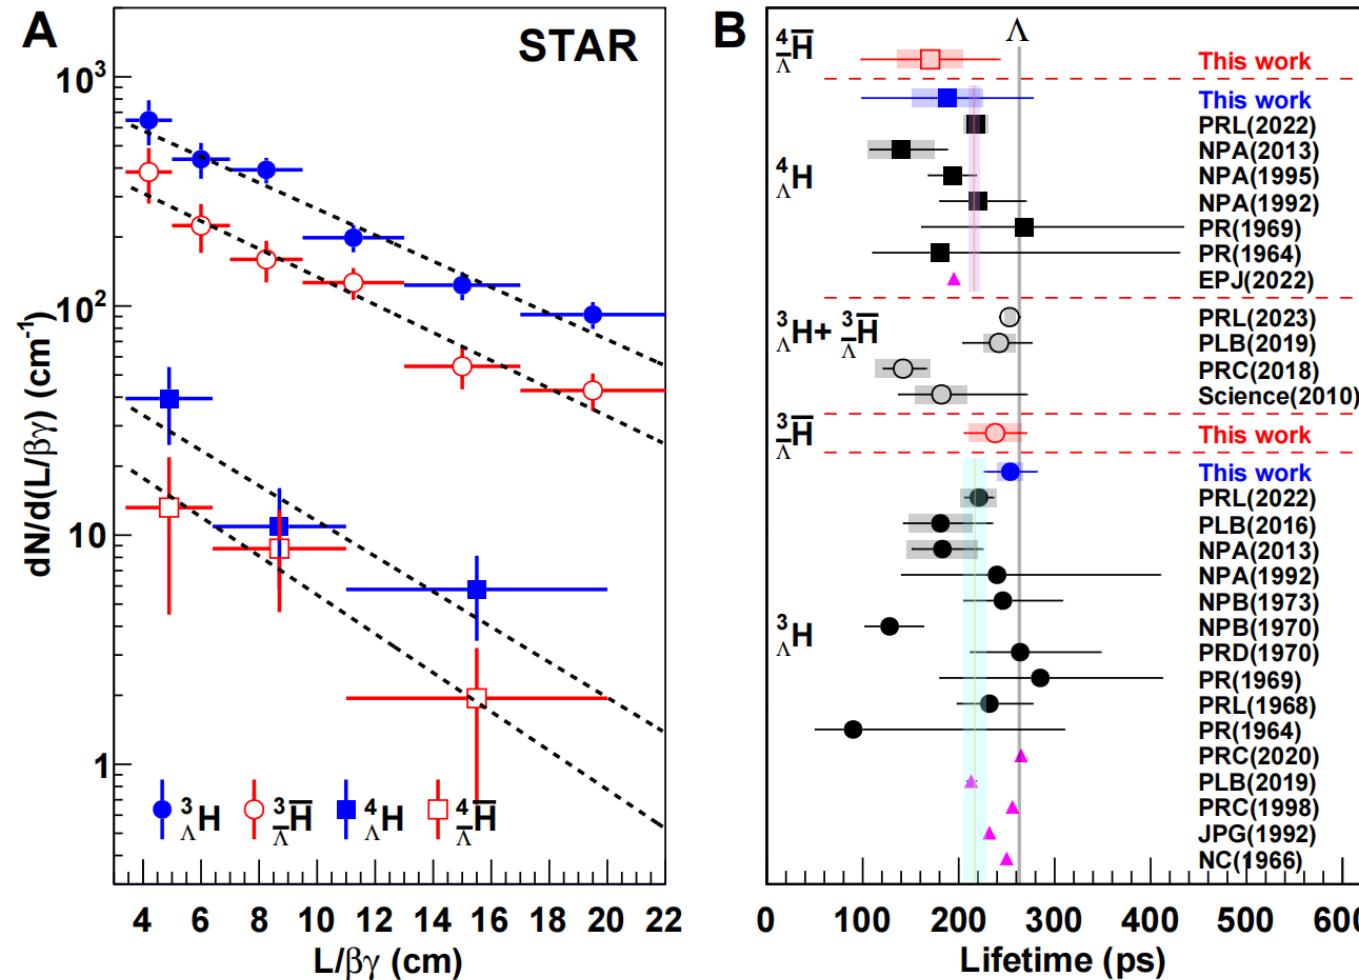

Signals

- Background invariant-mass distributions obtained by rotating the (anti)He daughter track before reconstructing the decay vertex
- $$Z_{\text{count}} = \sqrt{2 \left[(N_{\text{Sig}} + N_{\text{Bg}}) \ln \left(1 + \frac{N_{\text{Sig}}}{N_{\text{Bg}}} \right) - N_{\text{Sig}} \right]}$$
- Z_{shape} obtained with `RooStats()::AsymptoticCalculator()` assuming pure background vs. background + Gaussian signal
- 15.6 ${}^4\bar{\Lambda}$ signal candidates
- Significances $Z_{\text{count}} = 4.8$, $Z_{\text{shape}} = 4.7$

The heaviest antihypernucleus observed

Lifetime Measurements & CPT Symmetry Test

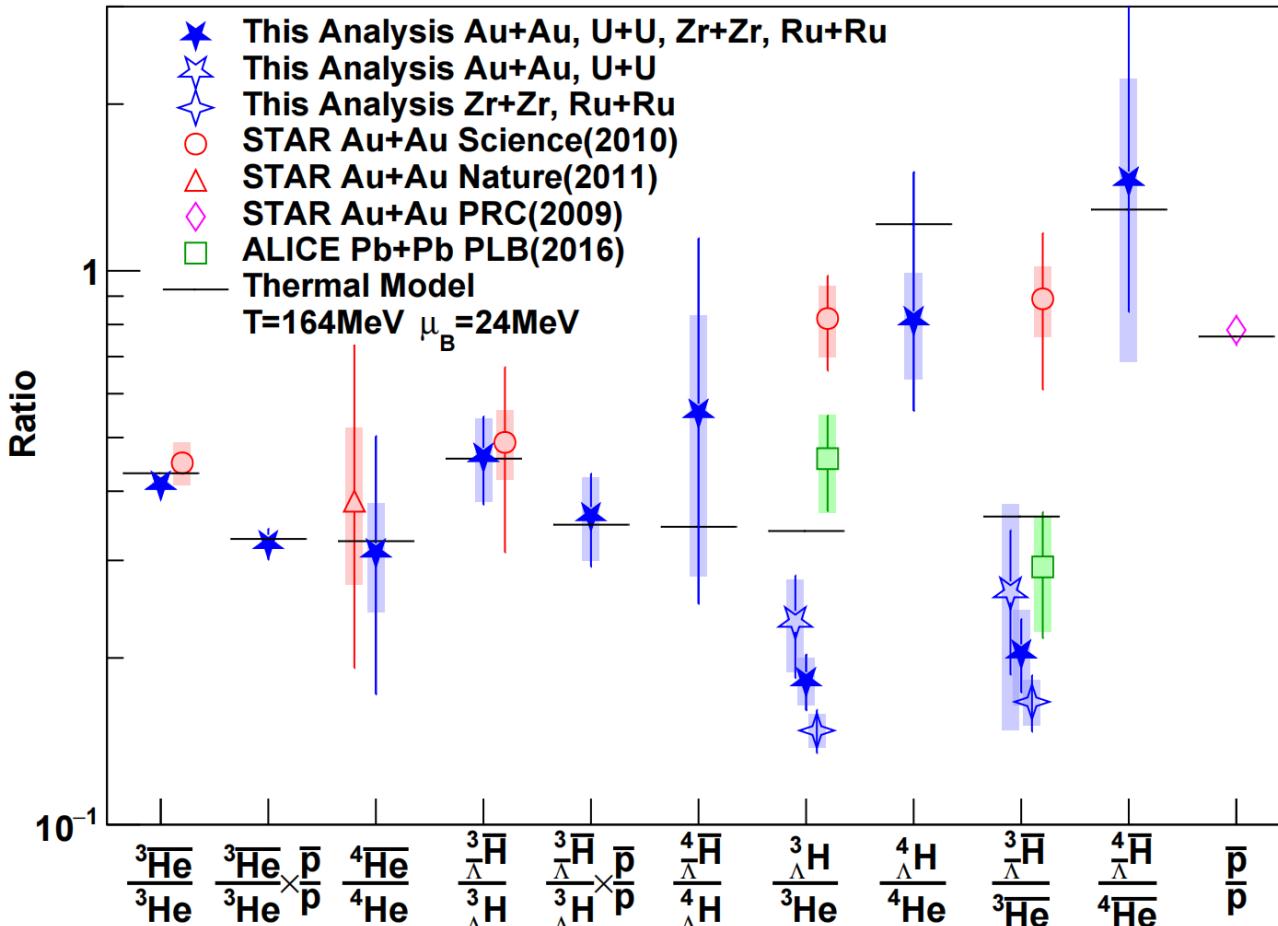

- Efficiency corrected
- Fit with exponential function: $N(t)=N_0 e^{-t/\beta\gamma\tau}$
- Our results consistent with previous average

$$\tau_{^3\Lambda H} - \tau_{^3\bar{\Lambda} H} = 16 \pm 43(\text{stat.}) \pm 20(\text{sys.}) \text{ ps}$$

$$\tau_{^4\Lambda H} - \tau_{^4\bar{\Lambda} H} = 18 \pm 115(\text{stat.}) \pm 46(\text{sys.}) \text{ ps}$$

- No lifetime difference between antihypernuclei and their corresponding hypernuclei within uncertainties

Yield Ratios

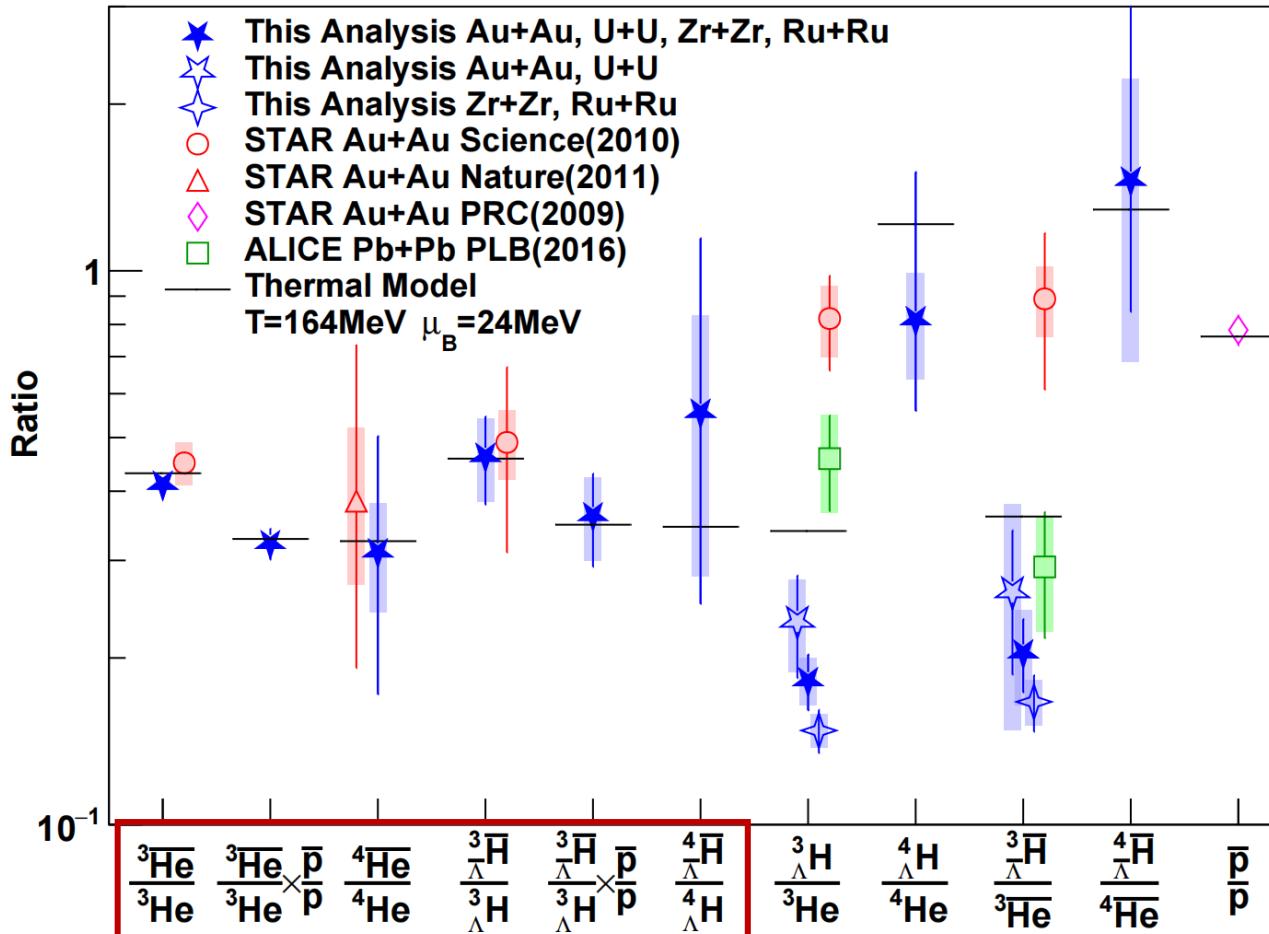

Nature 2024, DOI: 10.1038/s41586-024-07823-0
Science 328, 58 (2010)
Nature 473, 353–356 (2011)

Phys. Rev. Lett. 97, 152301
Phys. Lett. B 754 (2016) 360
Phys. Lett. B 697.3 (2011)

- Branch fraction assumed:
 - 25% for ${}^3_\Lambda H \rightarrow {}^3 He + \pi^-$
 - 50% for ${}^4_\Lambda H \rightarrow {}^4 He + \pi^-$
- Phase space: $0.7 < p_T/M < 1.5$, $|y| < 0.7$
- $\frac{{}^3_\Lambda H}{{}^3 He}$ & $\frac{{}^4_\Lambda H}{{}^3 He}$ ratios measured in large and small collision systems separately to have a fair comparison with previous measurements
- Our results are consistent with previous results, except that the $\frac{{}^3_\Lambda H}{{}^3 He}$ & $\frac{{}^4_\Lambda H}{{}^3 He}$ ratios are lower than Science 2010 results by 2.8 & 1.9σ

Yield Ratios

Nature 2024, DOI: 10.1038/s41586-024-07823-0
Science 328, 58 (2010)
Nature 473, 353–356 (2011)

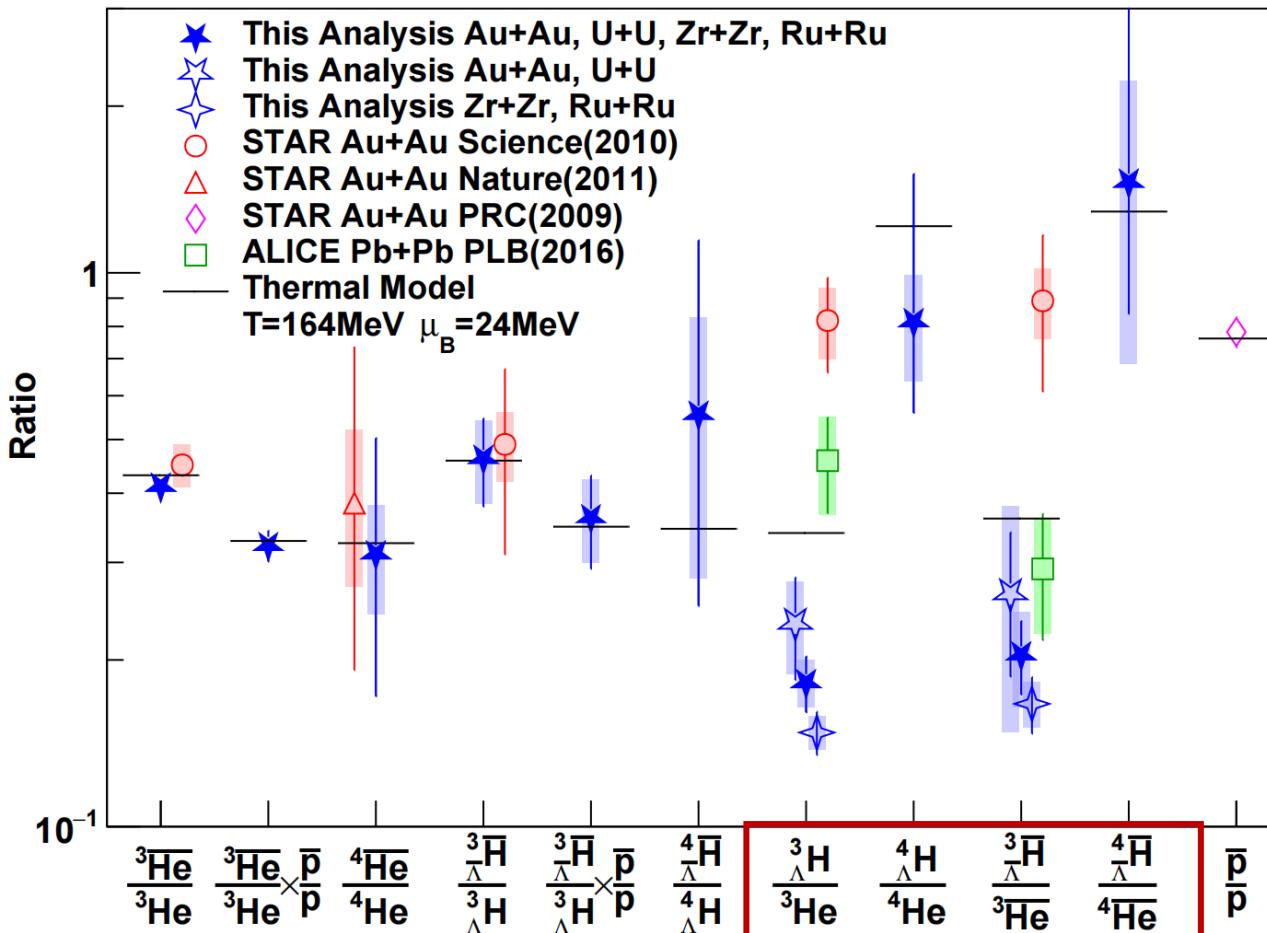

Phys. Rev. Lett. 97, 152301
Phys. Lett. B 754 (2016) 360
Phys. Lett. B 697.3 (2011)

$${}^4\bar{\text{He}}/{}^4\text{He} \sim {}^3\bar{\text{He}}/{}^3\text{He} \times \bar{p}/p$$

$${}^4\bar{\Lambda}/{}^4\Lambda \sim {}^3\bar{\Lambda}/{}^3\Lambda \times \bar{p}/p$$

- Consistent with expectation of coalescence picture
- Consistent with thermal model predictions

Yield Ratios

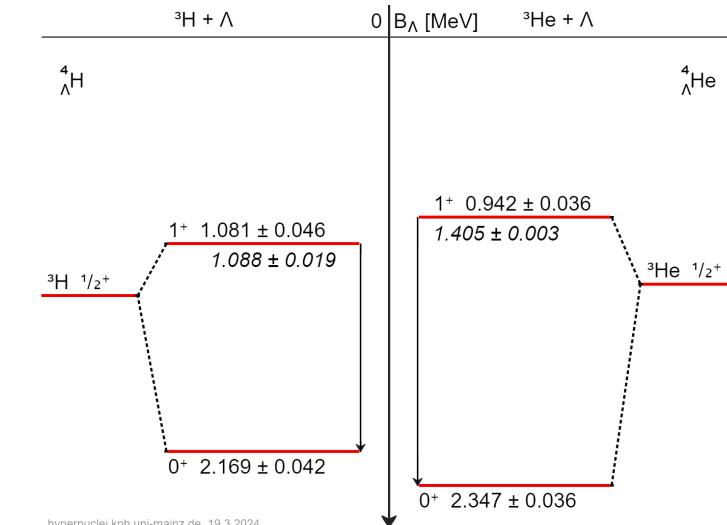

Nature 2024, DOI: 10.1038/s41586-024-07823-0
 Science 328, 58 (2010)
 Nature 473, 353–356 (2011)

Phys. Rev. Lett. 97, 152301
 Phys. Lett. B 754 (2016) 360
 Phys. Lett. B 697.3 (2011)

$${}^4_{\Lambda}\text{H} / {}^4_{\Lambda}\text{He} \sim 4 \times {}^3_{\Lambda}\text{H} / {}^3_{\Lambda}\text{He}$$

$${}^4_{\bar{\Lambda}}\text{H} / {}^4_{\bar{\Lambda}}\text{He} \sim 4 \times {}^3_{\bar{\Lambda}}\text{H} / {}^3_{\bar{\Lambda}}\text{He}$$

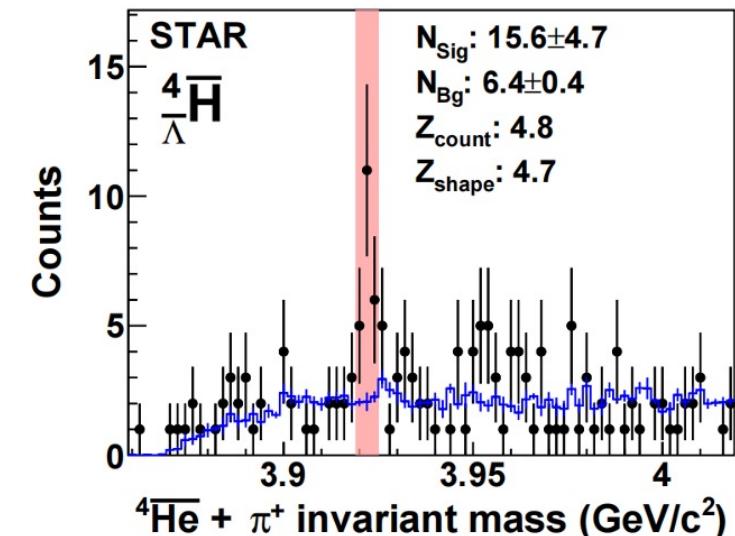

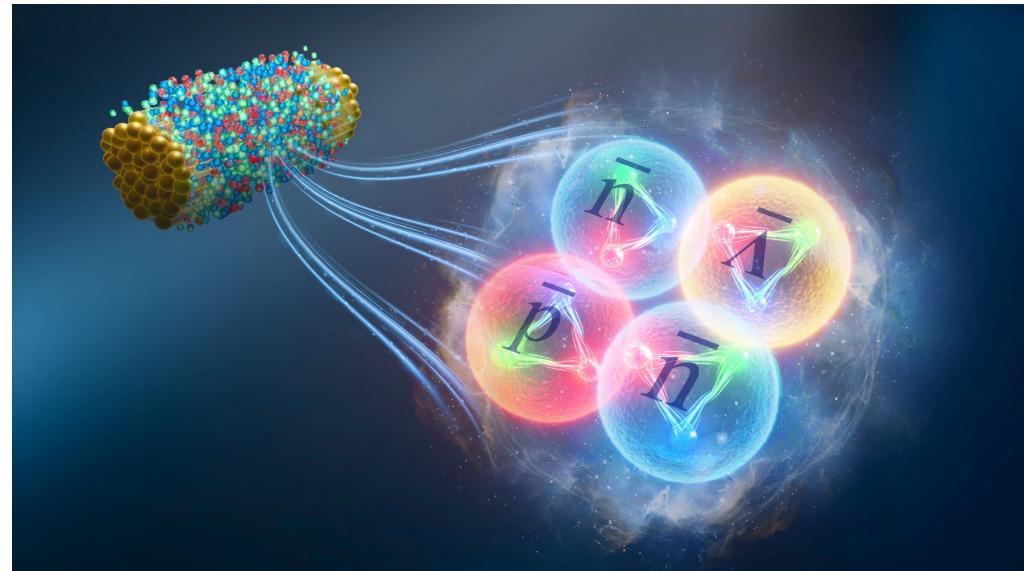

- Factor 4 due to spin-1 excited states of ${}^4_{\Lambda}\text{H}$ & ${}^4_{\bar{\Lambda}}\text{H}$

- Consistent with expectation of coalescence picture
- Consistent with thermal model predictions

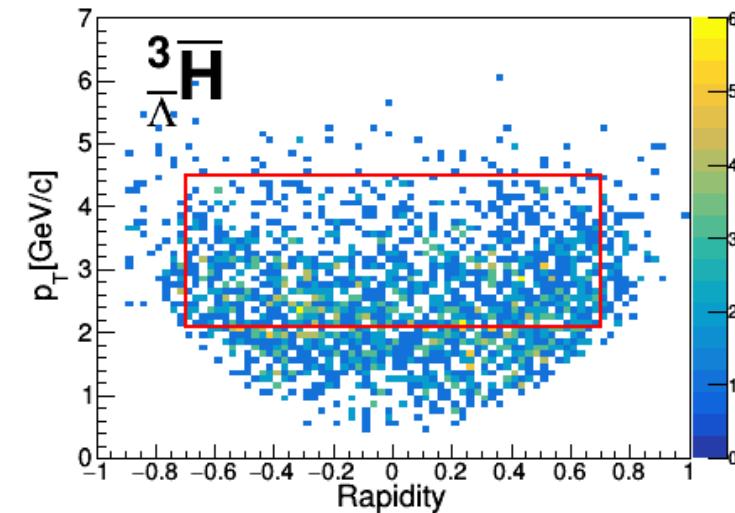

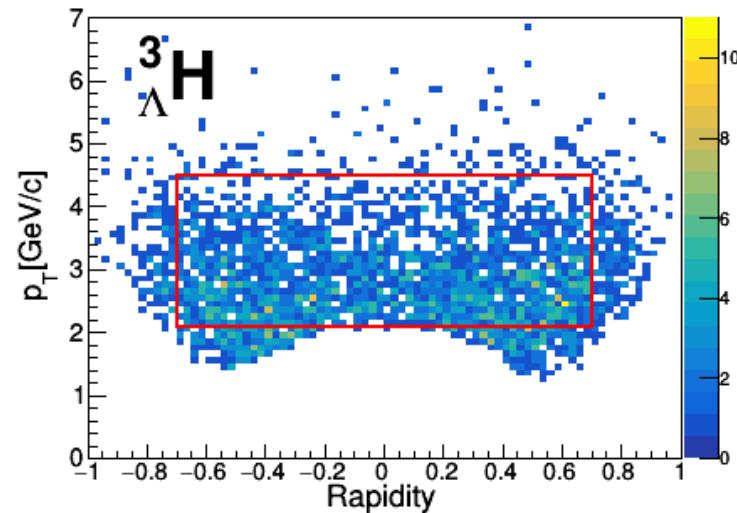

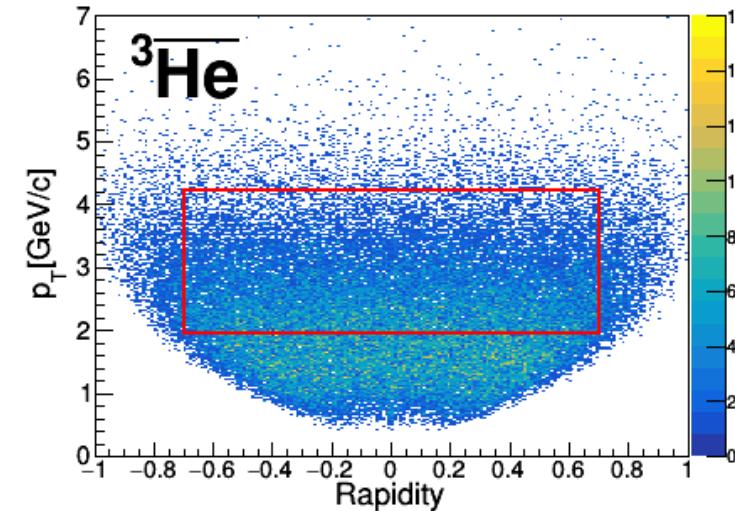

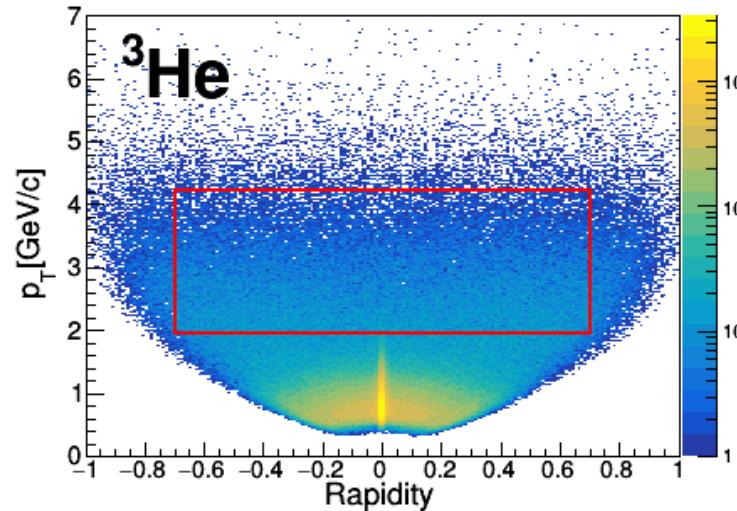

Summary

- 15.6 ${}^4\bar{\Lambda}$ signal candidates observed, with a significance of 4.7σ
- Lifetimes of (anti)hypernuclei compared
 - $\tau_{\Lambda^3H} \approx \tau_{\bar{\Lambda}^3\bar{H}}$, $\tau_{\Lambda^4H} \approx \tau_{\bar{\Lambda}^4\bar{H}}$
 - Confirming CPT symmetry
- Various (anti)particle production yield ratios presented
 - ${}^4\bar{\text{He}}/{}^4\text{He} \sim {}^3\bar{\text{He}}/{}^3\text{He} \times \bar{p}/p$
 - ${}^4\bar{\Lambda}/{}^4\bar{\Lambda}\text{H} \sim {}^3\bar{\Lambda}/{}^3\Lambda\text{H} \times \bar{p}/p$
 - ${}^4\bar{\Lambda}\text{H}/{}^4\text{He} \sim 4 \times {}^3\bar{\Lambda}\text{H}/{}^3\text{He}$
 - ${}^4\bar{\Lambda}/{}^4\bar{\text{He}} \sim 4 \times {}^3\bar{\Lambda}/{}^3\bar{\text{He}}$
 - Consistent with coalescence picture and thermal model

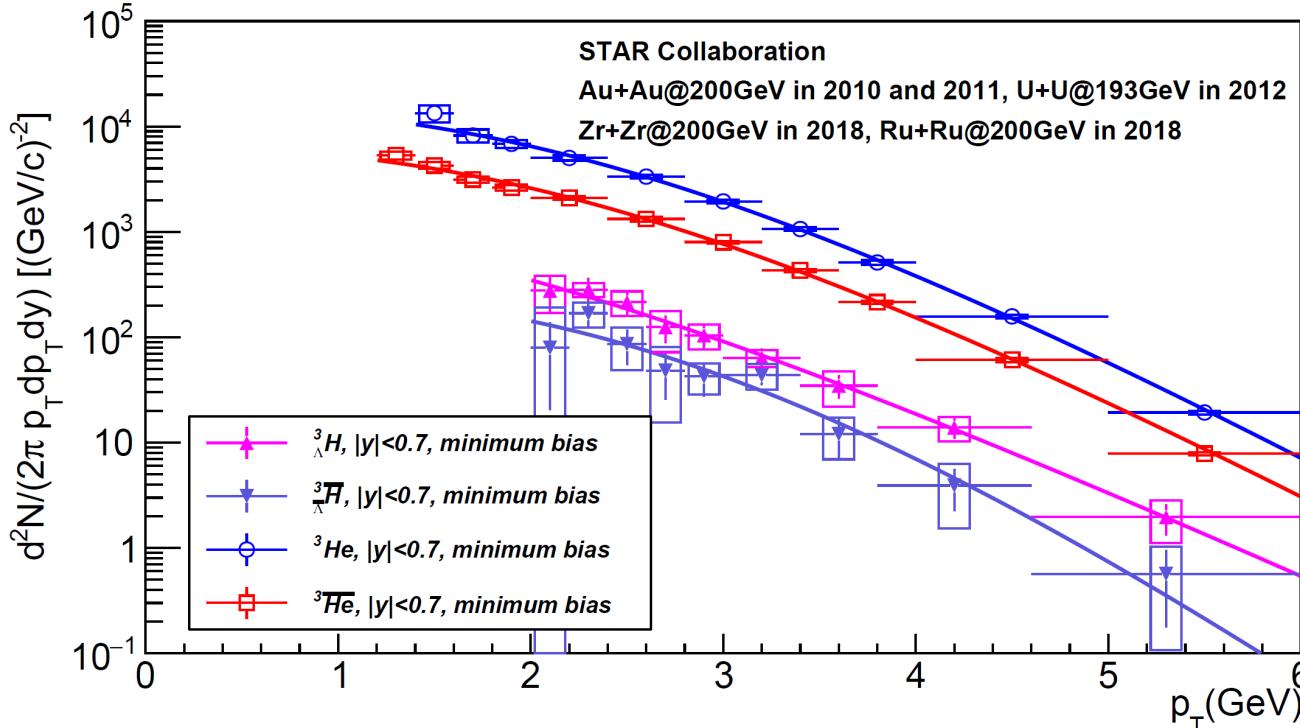

Thanks ☺

Back Up: Yield Ratios Measurement - Phase Space

- Yield measurement in phase space region : $0.7 < p_T/M < 1.5$, $|\text{rapidity}| < 0.7$

Back Up: Yield Ratios Measurement - A = 3 Particles

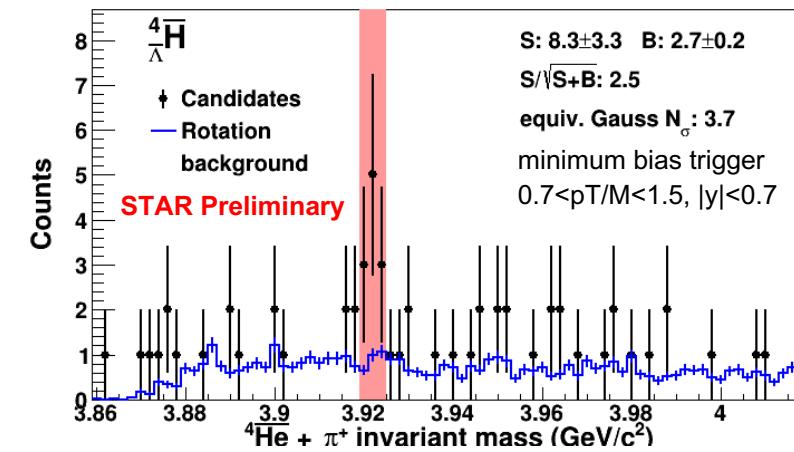

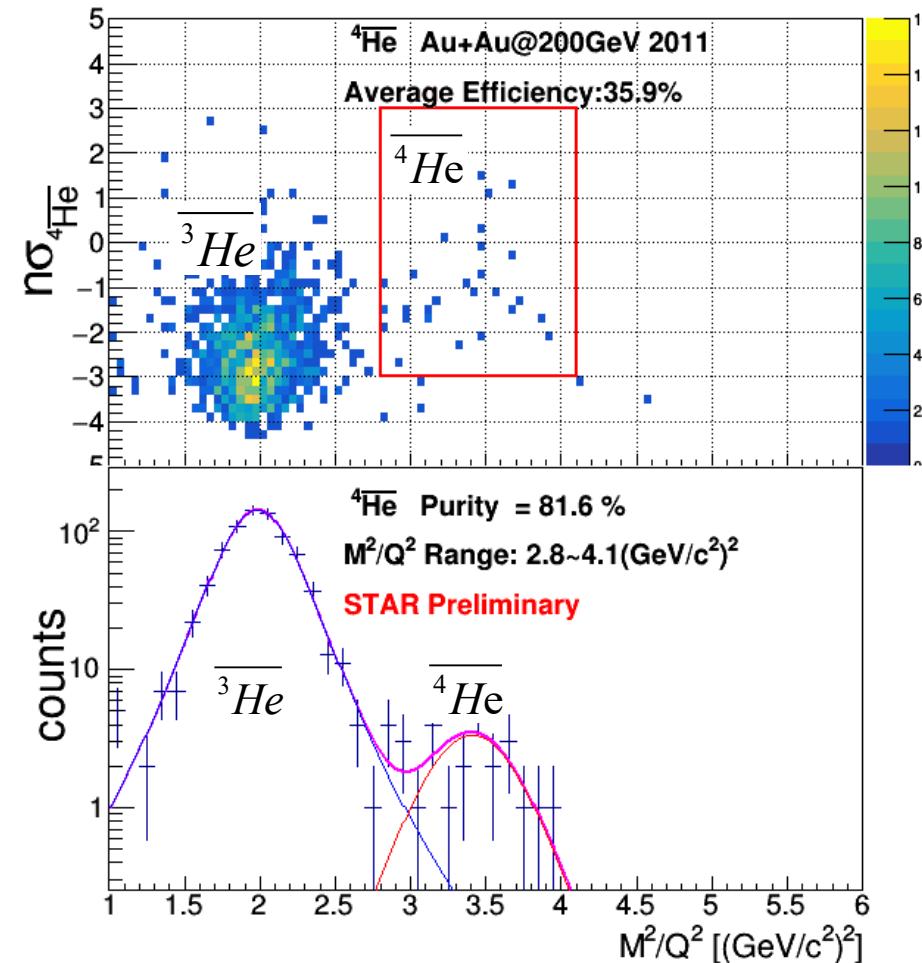

- 3He , ${}^3\Lambda \bar{He}$, 3H and ${}^3\Lambda \bar{H}$: Yields are obtained by integrating over the measured p_T spectrum.

Blast Wave function fit:

$$\frac{1}{2\pi p_T} \frac{d^2 N}{dp_T dy} \propto \int_0^R r dr m_0 I_0\left(\frac{p_T \sinh \rho}{T}\right) K_1\left(\frac{m_T \cosh \rho}{T}\right)$$

- *Physical Review C Volume 48, Number 5, 1993*

Back Up: Yield Ratios Measurement - A = 4 Particles

- For A = 4 particles, the yields are too low to obtain a p_T spectrum.
- An average efficiency is obtained for the whole measured p_T range, assuming Blast Wave functional shape with the same T and β as those of A = 3 particles.
