## Data preservation in OPAL

*Wednesday 2 October 2024 15:15 (15 minutes)*

OPAL has always envisioned to keep its software stack working on recent operating systems.

At the last DP workshop the main risks for this approach were

- non availability of CERNLIB for recent OS versions
- the future of 32 bit compilers
- Uncertainty about the compatibility of the full software stack with 64 bit compilers

I will report about the current status of these issues, recent developments and the foreseen next steps.

### Summary

**Presenter:** SCHROEDER, Matthias

**Session Classification:** Experiments and sites
