Motivation: Hadronization

Hadronization: Partons \rightarrow Hadrons

Particle Colliders (LHC)

Proton content

Partons: quarks and gluons

color particles QCD

Motivation: Fragmentation functions (FFs)

➤ **What** are FFs?

$$D_i^h(z, Q) \propto \text{Prob}(\text{parton}(i) \rightarrow \text{hadron}(h))$$

$z \equiv$ momentum fraction $Q \equiv$ energy scale

➤ **Why** are important?

Compute integrals \rightarrow predictions of observables (cross-sections)

$$\frac{d\sigma}{dz}(z, Q) \propto D_i^h(z, Q)$$

➤ **How** are determined?

- Statistical and ML methods to **learn** FFs from data

$$D_i^h(z, Q_0) \propto z^\alpha (1 - z)^\beta$$

- **Caveat:** Interpolation for Q solving DGLAP evolution equations

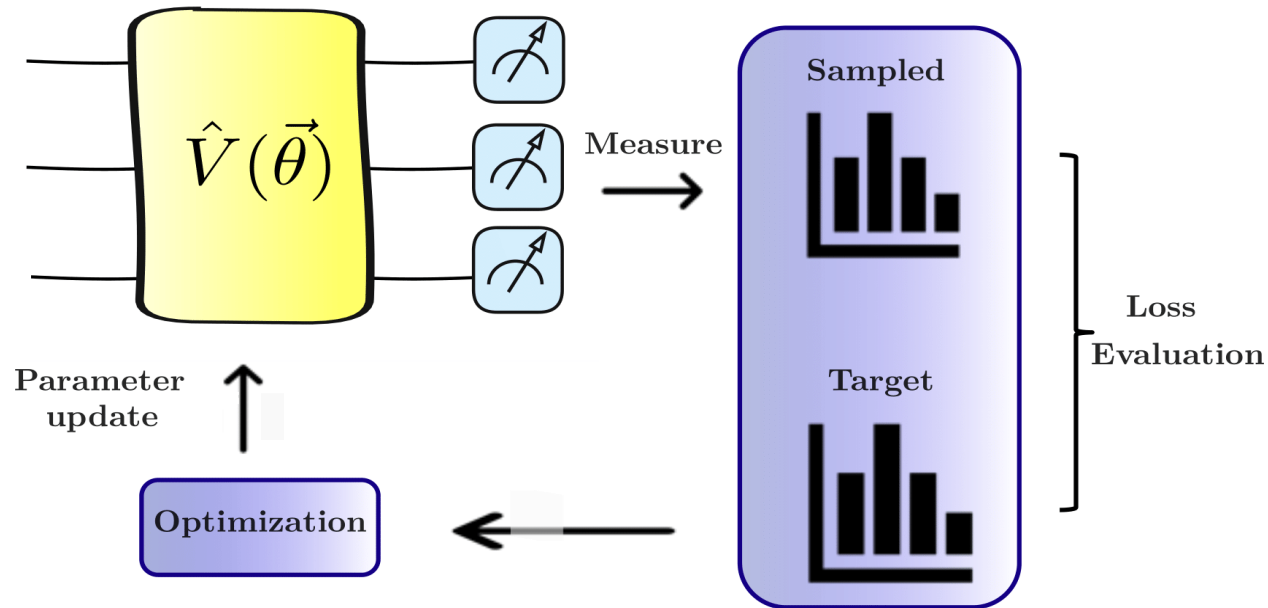

Motivation: Quantum Generative Models (QGM)

1. **Learn** target distributions

2. Generate new **samples**

3. Potentially more **efficient**

QGM

4. Examples: QGANs, QCBM, QAE, **QChGM**

Quantum Chebyshev Generative Models

➤ Chebyshev Feature map:

- Chebyshev polynomials:

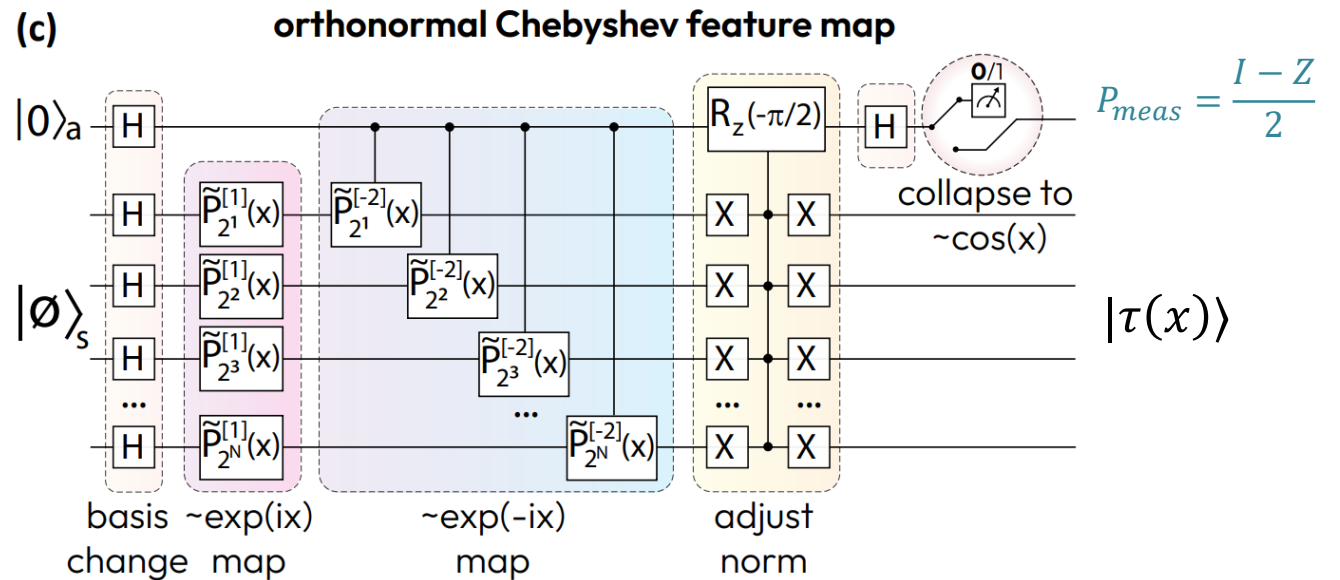

$$T_k(x) \equiv \cos(k \arccos(x))$$

- Quantum state with Cheb. poly. as **amplitudes**

$$|\tau(x)\rangle = \frac{1}{2^{N/2}} T_0(x)|0\rangle + \frac{1}{2^{(N-1)/2}} \sum_{k=1}^{2^N-1} T_k(x)|k\rangle$$

- The feature map such $\hat{U}_\tau(x)|0\rangle = |\tau(x)\rangle$

Orthogonal at the nodes
 $x_j^{\text{Ch}} := \cos(\pi/2(2j + 1)/2^N)$

Quantum Chebyshev Generative Models

➤ Quantum Chebyshev Transform:

➤ Need a **map** between Cheb ↔ Computational basis

➤ One can **go back** to computational basis (f):

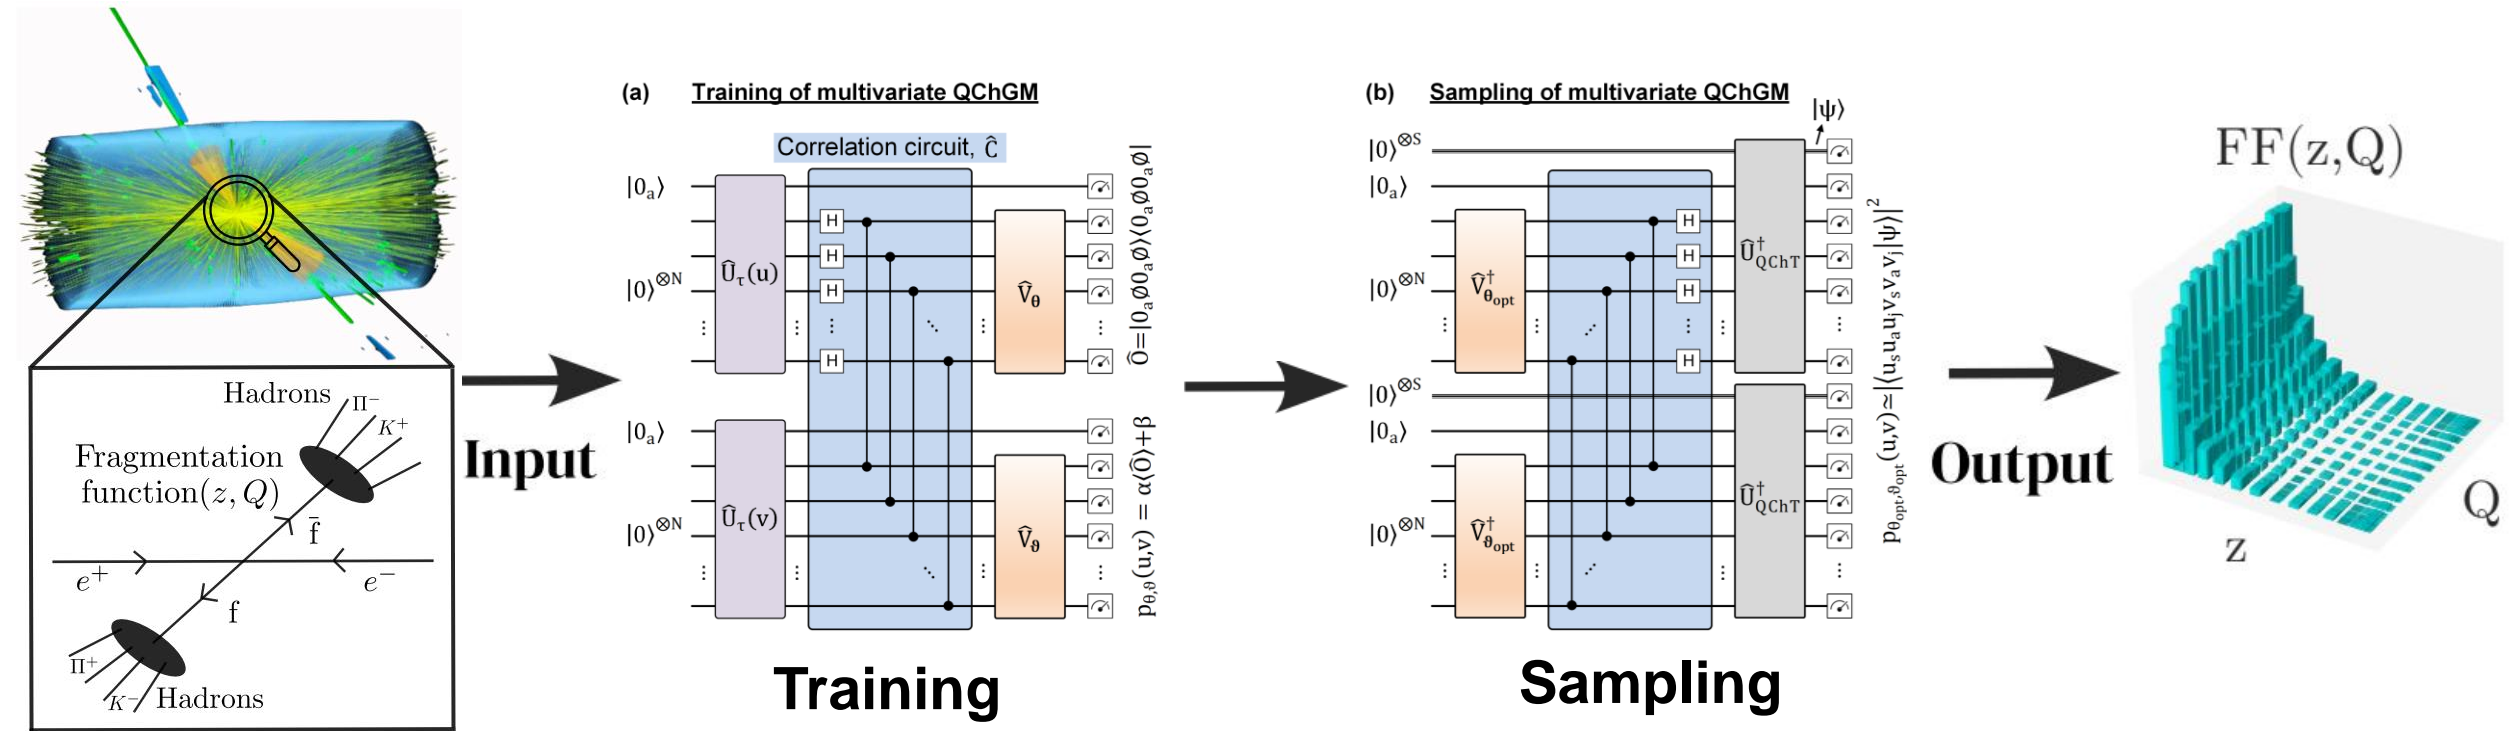

$$\hat{u}_f = \hat{u}^\dagger_{\text{QChT}} \hat{u}_\tau(x)$$

$$\hat{u}_{\text{QChT}} = \sum_{j=0}^{2^N-1} |\tau(x_j^{\text{Ch}})\rangle \langle x_j|$$

Quantum Chebyshev Generative Models

➤ Workflow of the model:

Results: QChGM for FF

➤ Simulation setup:

- Analyze FF data: $D_{u^+}^h, D_{d^++s^+}^h, D_{c^+}^h, D_{b^+}^h, D_g^h$ $\left\{ \begin{array}{l} \text{with } h = \pi^\pm, K^\pm \\ \text{for } z \in [0.01, 1], Q \in [1, 10000] \end{array} \right.$
- Quantum simulation: → per **variable**:
4 qubits, 3 ansatz layers=16 parameters
- Optimizer: ADAM, iterations=10000, learning rate $\in [0.1, 1]$
- Data from: <http://lhpdf.hepforge.org/>
 - NNF10_Plsum_nnlo
 - NNF10_KAsum_nnlo

LHAPDF6: parton density access in the LHC precision era: Andy Buckley, James Ferrando, Stephen Lloyd, Karl Nordstrom, Ben Page, Martin Ruefenacht, Marek Schoenherr, Graeme Watt, *Eur.Phys.J.C* 75 (2015) 132

Results: QChGM for FF

➤ Training and sampling:

➤ Example $D_g^{K^\pm}$:

Target:

Predictions: $R^2 = 0.99$

Results: QChGM for FF

➤ Training and sampling:

➤ Example $D_g^{K^\pm}$:

Target:

Sampling:

Extended sampling (more qubits)

Quantum interpolation

1 extra qubit for variable $s = 1$

2 extra qubits for variable $s = 2$

Results: QChGM for FF

➤ All the results: Fragmentation Functions of K^\pm

Target $D_g^{K^\pm}(z, Q)$

(a) Target $D_g^{K^\pm}$

Extended sampling $D_g^{K^\pm}(z, Q), s = 1$

(f) Sampling $D_g^{K^\pm}$

Target $D_b^{K^\pm}(z, Q)$

(b) Target $D_b^{K^\pm}$

Extended sampling $D_b^{K^\pm}(z, Q), s = 1$

(g) Sampling $D_b^{K^\pm}$

Target $D_c^{K^\pm}(z, Q)$

(c) Target $D_c^{K^\pm}$

Extended sampling $D_c^{K^\pm}(z, Q), s = 1$

(h) Sampling $D_c^{K^\pm}$

Target $D_{d^{++}+s^+}^{K^\pm}(z, Q)$

(d) Target $D_{d^{++}+s^+}^{K^\pm}$

Extended sampling $D_{d^{++}+s^+}^{K^\pm}(z, Q), s = 1$

(i) Sampling $D_{d^{++}+s^+}^{K^\pm}$

Target $D_u^{K^\pm}(z, Q)$

(e) Target $D_u^{K^\pm}$

Extended sampling $D_u^{K^\pm}(z, Q), s = 1$

(j) Sampling $D_u^{K^\pm}$

Results: QChGM for FF

➤ **All the results:** Fragmentation Functions of π^\pm

Target $D_g^{\Pi^\pm}(z, Q)$

(a) Target $D_g^{\Pi^\pm}$

Target $D_b^{\Pi^\pm}(z, Q)$

(b) Target $D_b^{\Pi^\pm}$

Target $D_c^{\Pi^\pm}(z, Q)$

(c) Target $D_c^{\Pi^\pm}$

Target $D_{d+s}^{\Pi^\pm}(z, Q)$

(d) Target $D_{d+s}^{\Pi^\pm}$

Target $D_u^{\Pi^\pm}(z, Q)$

(e) Target $D_u^{\Pi^\pm}$

Extended sampling $D_g^{\Pi^\pm}(z, Q), s = 1$

(f) Sampling $D_g^{\Pi^\pm}$

Extended sampling $D_b^{\Pi^\pm}(z, Q), s = 1$

(g) Sampling $D_b^{\Pi^\pm}$

Extended sampling $D_c^{\Pi^\pm}(z, Q), s = 1$

(h) Sampling $D_c^{\Pi^\pm}$

Extended sampling $D_{d+s}^{\Pi^\pm}(z, Q), s = 1$

(i) Sampling $D_{d+s}^{\Pi^\pm}$

Extended sampling $D_u^{\Pi^\pm}(z, Q), s = 1$

(j) Sampling $D_u^{\Pi^\pm}$

Results: QChGM for FF

➤ Study of correlations:

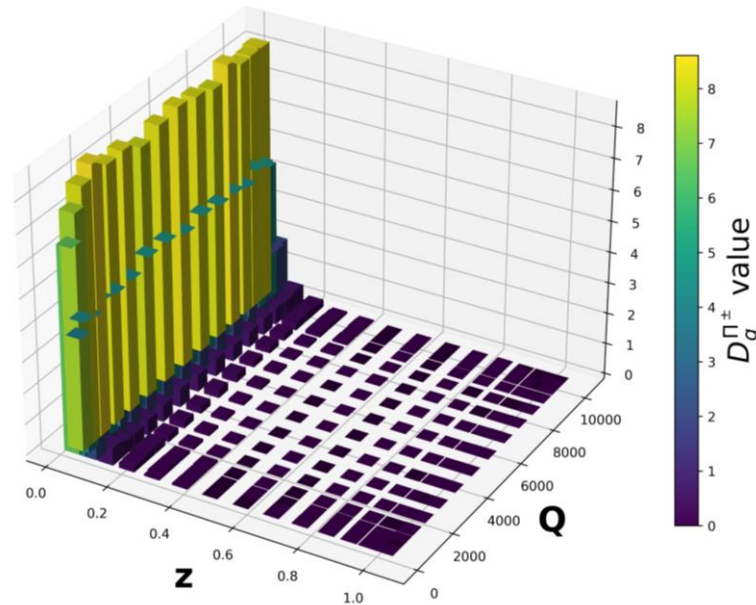

Correlations circuit

Example $D_g^{\pi^\pm}$: 4 qubits, 3 layers, 10000 iter., learning rate $\in [0.1,1]$

W/ CC: $R^2 = 0.99$

W/o CC: $R^2 = 0.85$

Results: QChGM for FF

Extending findings of:

Better than classical? The subtle art of benchmarking quantum machine learning models:
Joseph Bowles, Shahnawaz Ahmed, Maria Schuld, arXiv:2403.07059

They: classification

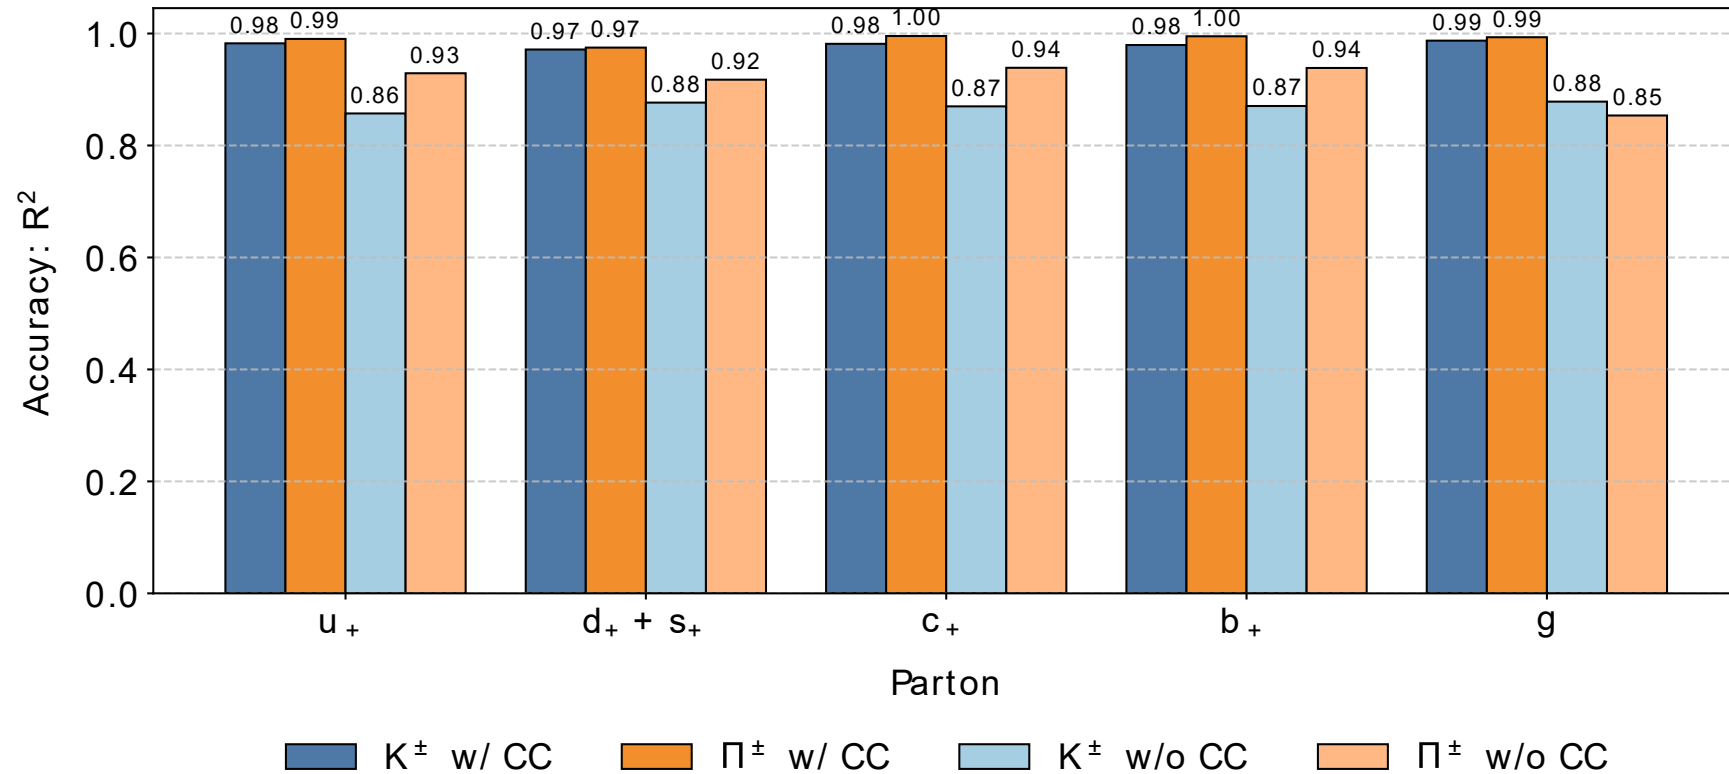

We: multivariate prob. distr.

"Quantumness" help the models to learn

Similar to: Yacine Haddad's poster

➤ Study of correlations:

Correlations circuit

Comparison all FF

Outlook

1. Successfully extended **QChGM** to **learn FFs**

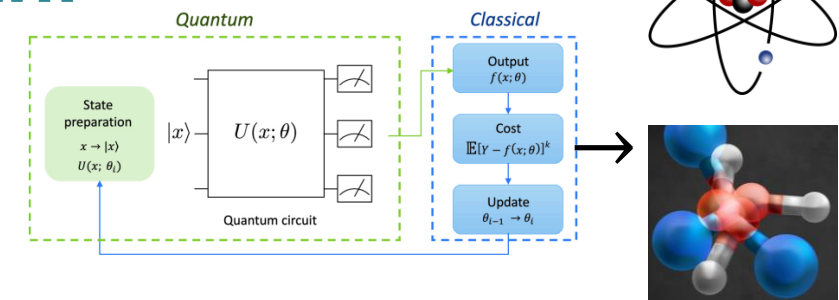

2. Efficient **sampling** with extended register

➤ Natural **quantum interpolation**

3. **Correlations** help the quantum model to **learn**

➤ Apply **QML** to analyze correlations in **physical processes**
