

# Opportunities of strong-field physics in intermediate-energy heavy-ion collisions

**Hidetoshi Taya**  
( Keio University )

[\[HT, Nishimura, Ohnishi 2402.17136\]](#) [\[HT, Jinno, Kitazawa, Nara 2409.07685\]](#)

# Plan

**Intermediate-energy heavy-ion collisions  $\sqrt{s_{NN}} = O(2 - 10 \text{ GeV})$  is interesting not only to QCD/hadron but also to strong-field QED**

## **1. Introduction to strong-field QED**

## **2. Strong EM field in high-energy heavy-ion collisions**

Strong but too short-lived  $\Rightarrow$  affects “non-perturbativity” of strong-field processes

## **3. Strong EM field in intermediate-energy heavy-ion collisions**

Estimate EM field profile with a hadron transport model (JAM)

$\Rightarrow$  “strong”  $O(50 \text{ MeV})$  and long-lived  $O(10 \text{ fm}/c)$

$\Rightarrow$  a nice setup to study strong-field QED; non-negligible to QCD/hadron processes as well

## **4. Summary**

# **1. Introduction to strong-field QED**

2. Strong EM field in high-energy HIC

3. Strong EM field in intermediate-energy HIC

4. Summary

# Strong-field QED

**Vacuum**  
(= No EM field)

# Strong-field QED

**Vacuum**  
(= No EM field)

**Weak EM field**  
( $eF/m^2 \lesssim 1$ )

**Strong EM field**  
( $eF/m^2 \gtrsim 1$ )

# Strong-field QED

**Vacuum**  
(= No EM field)

**Weak EM field**  
( $eF/m^2 \lesssim 1$ )

**Strong EM field**  
( $eF/m^2 \gtrsim 1$ )

Almost the same

⇒ Perturbative

⇒ Understood

ex) Electron anomalous magnetic moment  $a := \frac{g-2}{2}$

$$\begin{aligned} a(\text{theor.}) &= 1159652182.03 \dots \times 10^{-12} \\ a(\text{exp.}) &= 1159652180.73 \dots \times 10^{-12} \end{aligned} \quad [\text{Aoyama, Kinoshita, Nio (2017)}]$$

# Strong-field QED

**Vacuum**  
(= No EM field)

**Weak EM field**  
( $eF/m^2 \lesssim 1$ )

**Strong EM field**  
( $eF/m^2 \gtrsim 1$ )

Almost the same  
⇒ Perturbative  
⇒ Understood

Completely different  
⇒ Non-perturbative  
⇒ Not understood

ex) Electron anomalous magnetic moment  $a := \frac{g-2}{2}$

$$\begin{aligned} a(\text{theor.}) &= 1159652182.03 \dots \times 10^{-12} \\ a(\text{exp.}) &= 1159652180.73 \dots \times 10^{-12} \end{aligned} \quad [\text{Aoyama, Kinoshita, Nio (2017)}]$$

# Examples of strong-field phenomena

## Novel QED processes ( $eF/m_e^2 \gtrsim 1$ )

Review: [Fedotov, Ilderton, Karbstein, King, Seipt, HI, Torgrimsson (2022)]

ex) Schwinger effect

Photon splitting

Vacuum birefringence  
(= Polarization dep. of reflective index)

## Impacts on QCD/hadron physics ( $eF/\Lambda_{\text{QCD}}^2 \gtrsim 1$ )

ex. 1) Hadron properties:

e.g., mass, charge dist., decay mode, ...

ex. 2) QCD phase diagram

e.g., (inverse) magnetic catalysis, new phase, ...

ex. 3) Others: Anomalous transport,

(for color EM field) Glasma, string breaking, ...

**Many theoretical predictions, but NEVER observed in experiments**

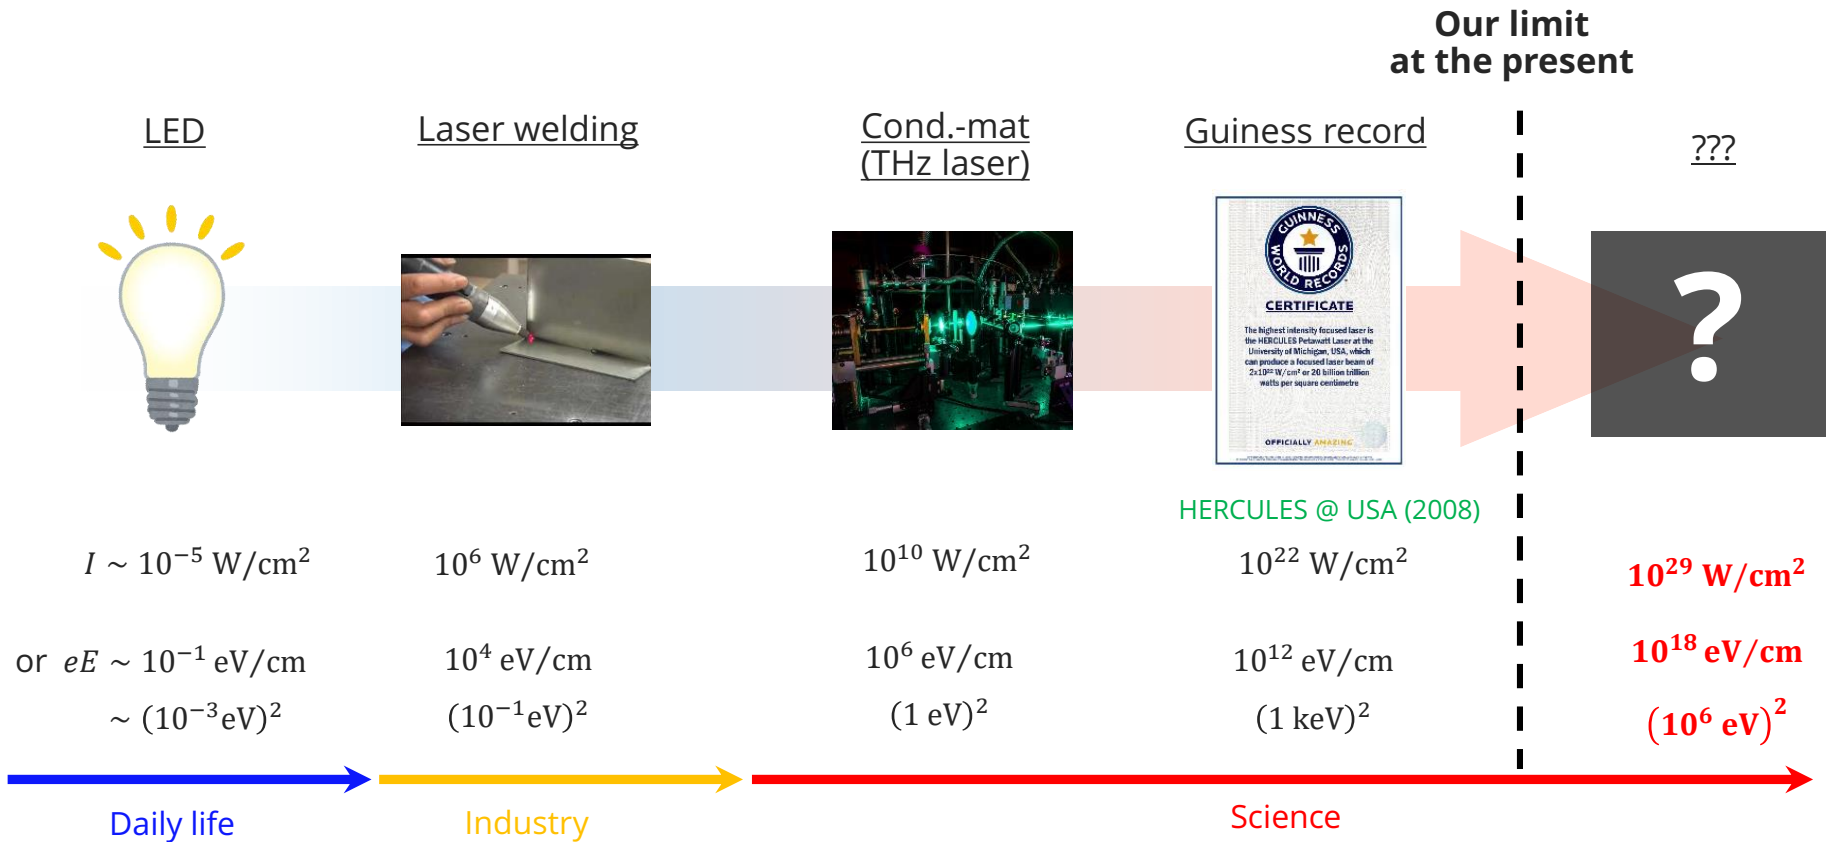

# Need of EXTREMELY strong EM field

## Order of the magnitude:

QED:  $eE, eB > m_e^2 = (0.511 \text{ MeV})^2 \approx O(10^{29} \text{ W/cm}^2)$

QCD:  $> \Lambda_{\text{QCD}}^2 = (200 \text{ MeV})^2 \approx O(10^{39} \text{ W/cm}^2)$

**Impossible within the current tech.  $\Rightarrow$  New idea needed  $\Rightarrow$  HIC ?**

1. Introduction to strong-field QED

**2. Strong EM field in high-energy HIC**

3. Strong EM field in intermediate-energy HIC

4. Summary

# Strong EM field at high-energy HIC

- ✓ Strong magnetic field is created

# Strong EM field at high-energy HIC

[Deng, Huang (2012)]

See also [Bzdak, Skokov (2012)] [Hattori, Huang (2016)]

✓ Strong magnetic field is created

**Pro:** Super strong  $eB \gg \Lambda_{\text{QCD}}^2$

**Cons:** Extremely short-lived ( $\tau \ll 1$  fm/c)

⇒ Affects “non-perturbativity” of strong-field physics

# Shorter lifetime $\Rightarrow$ less non-perturbative

Intuition: No time for multiple interactions

# Shorter lifetime $\Rightarrow$ less non-perturbative

## “Phase diagram” of strong-field physics

- As example: Vacuum particle prod. by E field w/ finite lifetime
- Three dimensional parameters in the system:  $eE, \tau, m$   
 $\Rightarrow$  Two dim.-less parameters determine the physics

$$\gamma = \frac{m}{eE \tau} = \frac{\text{(Typical energy)}}{\text{(Work by field)}} \Rightarrow \text{Characterize the magnitude of work}$$

$$\nu = \frac{eE \tau}{1/\tau} = \frac{\text{(Work by field)}}{\text{(Photon energy)}} \Rightarrow \text{Characterize the number of photons}$$

- $\gamma \ll 1, \nu \gg 1 \Rightarrow$  Non-perturbative v.s.  $\gamma \gg 1, \nu \ll 1 \Rightarrow$  perturbative

- High-energy HIC:  $eF \sim (1 \text{ GeV})^2, \tau \sim 0.1 \text{ fm}/c \Rightarrow \gamma \sim \begin{cases} 10^{-3} (m = \Lambda_{\text{QCD}}) \\ 10^{-5} (m = m_e) \end{cases}, \nu \sim 0.1$

[HT, Fujii, Itakura (2014)]  
[HT, Fujimori, Misumi, Nitta, Sakai (2021)]

# Shorter lifetime $\Rightarrow$ less non-perturbative

## “Phase diagram” of strong-field physics

- As example: Vacuum particle prod. by E field w/ finite lifetime

[HT, Fujii, Itakura (2014)]  
[HT, Fujimori, Misumi, Nitta, Sakai (2021)]

- Three dimensional parameters in the system:  $eE, \tau, m$

$\Rightarrow$  Two dim.-less parameters determine the physics

$$\gamma = \frac{m}{eE \tau} = \frac{\text{(Typical energy)}}{\text{(Work by field)}} \Rightarrow \text{Characterize the magnitude of work}$$

$$\nu = \frac{eE \tau}{1/\tau} = \frac{\text{(Work by field)}}{\text{(Photon energy)}} \Rightarrow \text{Characterize the number of photons}$$

- $\gamma \ll 1, \nu \gg 1 \Rightarrow$  Non-perturbative v.s.  $\gamma \gg 1, \nu \ll 1 \Rightarrow$  perturbative

- High-energy HIC:  $eF \sim (1 \text{ GeV})^2, \tau \sim 0.1 \text{ fm}/c \Rightarrow \gamma \sim \begin{cases} 10^{-3} (m = \Lambda_{\text{QCD}}) \\ 10^{-5} (m = m_e) \end{cases}, \nu \sim 0.1$

**High-energy heavy-ion collision is short-lived**

**$\Rightarrow$  NOT useful for strong-field phys. in non-perturbative regime**

Actually, only NLO processes such as Breit-Wheeler have been observed in exp.; no signals of higher-order effects

1. Introduction to strong-field QED
2. Strong EM field in high-energy HIC
- 3. Strong EM field in intermediate-energy HIC**
4. Summary

# Intermediate-energy HIC

Heavy-ion collisions at  $\sqrt{s_{NN}} = O(2 - 10)$

[AGS, SPS, RHIC BES, FAIR, NICA, HIAF, J-PARC-HI, ...]

$t = 0.0 \text{ fm}/c$  at  $x = 0.0 \text{ fm}$

[HT, Jinno, Kitazawa, Nara (2024)]

$\sqrt{s_{NN}} = 2.4 \text{ GeV}$

3.9 GeV

7.2 GeV

11.5 GeV

Stopping  
(Landau)

Penetration  
(Bjorken)

- Idea: baryon stopping at lower energies  $\Rightarrow$  dense matter w/ long lifetime
- The lifetime can reach  $O(10 \text{ fm}/c)$

# Dense $\Rightarrow$ Strong Coulomb field

**Strong Coulomb electric field should be produced due to large  $Z_{\text{tot}} = 2Z \sim 200 > \alpha^{-1}$**

- Very rough order estimate

$$\text{Strength: } eE \sim \frac{Z\alpha}{r^2} \sim \Lambda_{\text{QCD}}^2 \sim (100 \text{ MeV})^2$$

$$\text{Lifetime: } \tau \sim 10 \text{ fm}/c$$

$$\Rightarrow \gamma = \frac{m}{eE\tau} \lesssim \begin{cases} 10^{-1} (m = \Lambda_{\text{QCD}}) \\ 10^{-4} (m = m_e) \end{cases} \sim 0.1, \nu = eE\tau^2 \gtrsim 10$$

**$\Rightarrow$  Non-perturbative  $\begin{cases} \gamma \ll 1 \\ \nu \gg 1 \end{cases}$  both for QED & QCD !**

- If this is true, it's super interesting, since this is the very first physical system where we can study strong-field physics in the non.-pert regime
- But, of course, it's too rough, so let's do a realistic estimate

# Approach: Hadronic transport model JAM

[Nara, Otsuka, Ohnishi, Nitta, Chiba (2000)]

- A successful model to simulate the realtime dynamics of heavy-ion collisions, reproducing various data (v1, yields, ...)
- Basic idea: superposition of collisions of individual hadrons (incl. inelastic channels such as resonance, string breaking, mini-jet)
- JAM returns the distribution of charged hadrons at each spacetime pt.

⇒ EM fields can be obtained as

$$A^\mu(x^0, \mathbf{x}) = \frac{1}{4\pi} \int_{-\infty}^{+\infty} d^3\mathbf{x}' \frac{J^\mu(x^0 - |\mathbf{x} - \mathbf{x}'|, \mathbf{x}')}{|\mathbf{x} - \mathbf{x}'|}$$

From JAM

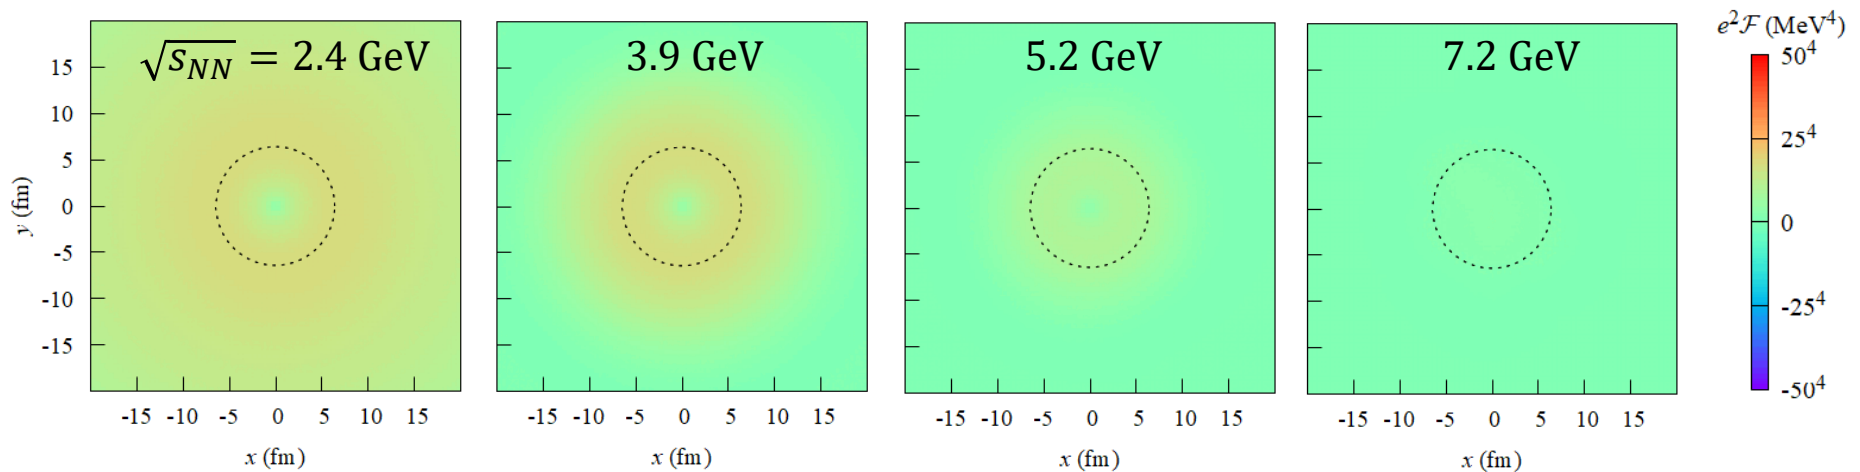

- NB: Just one of the models, not a first-principle calculation (e.g., no quark/gluon DoGs, no hydro, no phase transition, ...)
  - ⇒ should be regarded as a “baseline”, before incl. non-trivial physics
  - ⇒ worth to compare w/ other models: UrQMD, HIJING, SMASH, ...

# Result (1/5): Spacetime profile at central coll.

✓ Event-averaged  $F := E^2 - B^2$  ( $F > 0$ : Electric,  $F < 0$ : Magnetic)

$t = 0.0 \text{ fm}/c$  at  $z = 0.0 \text{ fm}$

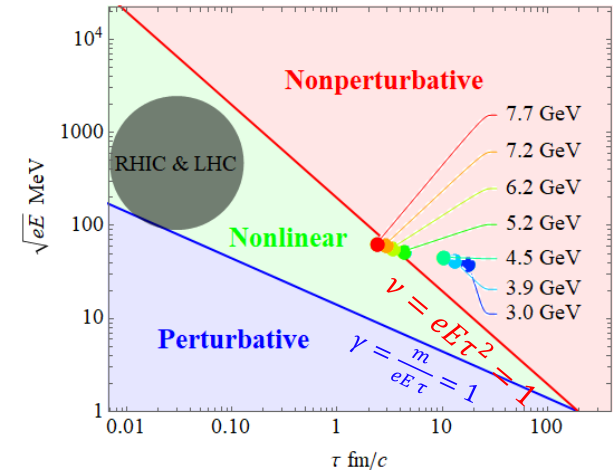

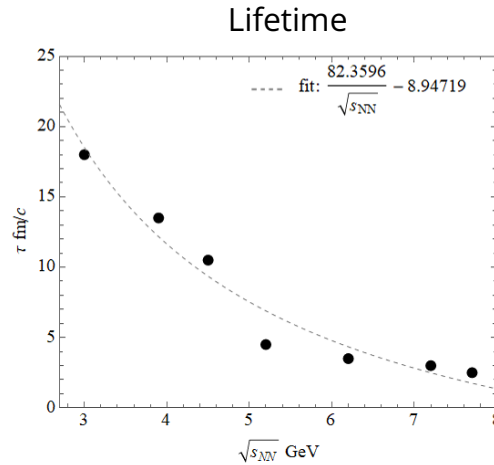

[HT, Nishimura, Ohnishi (2024)]

- $F$  is positive  $\Rightarrow$  E field dominates over B field
- Donuts shaped  $\Leftarrow$  Gauss law  $E \propto \int d^3x \rho$
- "strong"  $O(50 \text{ MeV})$  and long-lived  $O(10 \text{ fm}/c)$

↖ much stronger than  $m_e$ , current quark mass; non-negligible to  $m_\pi, \Lambda_{\text{QCD}}$

# Result (2/5): Strength & lifetime at central coll.

## ✓ Peak field strength and lifetime (FWHM)

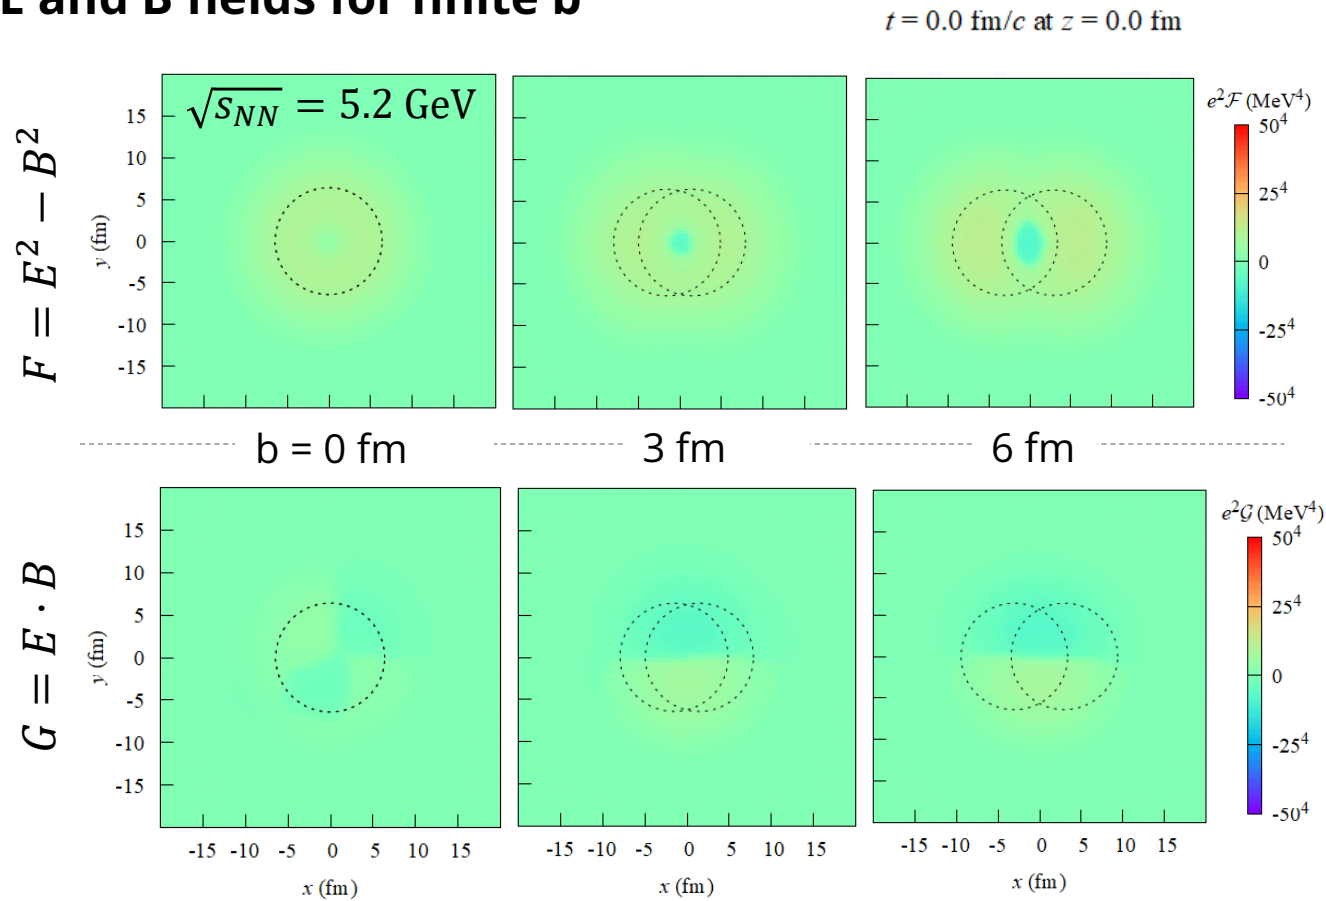

[HT, Nishimura, Ohnishi (2024)]

- Two basic physics: Lorentz contraction, Baryon stopping
- Intermediate energies can explore the non-perturbative regime
  - ⇐ Long lifetime compensates the weakness of the field

# Result (3/5): Spacetime profile at **non-central coll.**

## ✓ Interplay between E and B fields for finite b

- B field appears but E field is always larger in space

[HT, in progress]

⇒ E field would be more important than B field in intermediate energies

- Parallel EM configuration s.t.  $G = E \cdot B \neq 0$

⇒ can be a source of chiral physics  $\partial_\mu J_5^\mu \propto E \cdot B$

# Result (4/5): Strength & lifetime of **F** at **non-central coll.**

[HT, in progress]

- E field is always strong compared to B field

⇒ E field is important even at peripheral events for intermediate energies

- Lifetimes are roughly the same and less sensitive to impact parameter  $b$ .

⇒ E & B fields can be non-pert. even at peripheral events

**max F ~ E field**

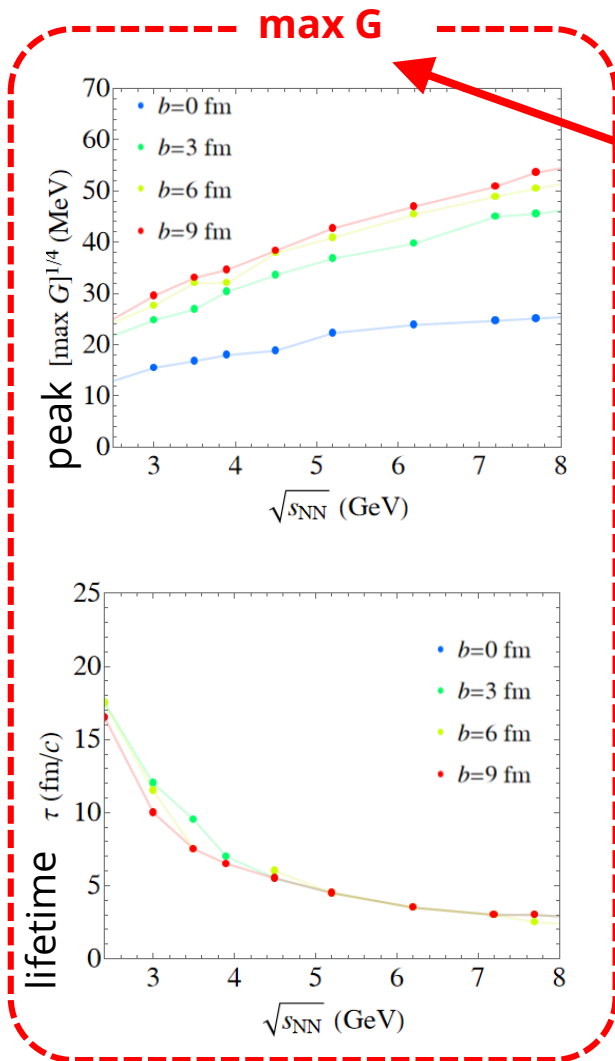

**min F ~ B field**

# Result (5/5): Strength & lifetime of **G** at **non-central coll.**

[HT, in progress]

- “Strong” as  $G \sim F = O(50 \text{ MeV})$
  - As long-lived as F as  $\tau = O(10 \text{ fm/c})$
- ⇒ Not a simple E or B field configuration, but need to think both F and G effects in intermediate energy heavy-ion collisions

(similar plot for max G  $\doteq$  — min G)

1. Introduction to strong-field QED
2. Strong EM field in high-energy HIC
3. Strong EM field in intermediate-energy HIC
- 4. Summary**

**Intermediate-energy heavy-ion collisions  $\sqrt{s_{NN}} = \mathcal{O}(2 - 10 \text{ GeV})$   
is interesting not only to QCD/hadron but also to strong-field QED**

## ✓ Strong EM field in high-energy heavy-ion collisions

- Strong but too short-lived  $\Rightarrow$  affects “non-perturbativity” of strong-field processes

## ✓ Strong EM field in intermediate-energy heavy-ion collisions

- Estimate EM field profile with a hadron transport model (JAM)
- Coulomb electric field is produced, which is “strong”  $\mathcal{O}(50 \text{ MeV})$  and long-lived  $\mathcal{O}(10 \text{ fm}/c)$   
 $\Rightarrow$  a novel opportunity to study strong-field QED; non-negligible to QCD/hadron as well
- E field is more important than B field
- “Chiral”  $E \cdot B \neq 0$  configuration in peripheral collisions
