What is AdaptivePerf

AdaptivePerf

Open-source profiler
Developed at **CERN** for
various architectures

SYCLOPS

EU funded - Open-source platform, and application tools for **AI/data mining acceleration with extremely large and diverse data.**

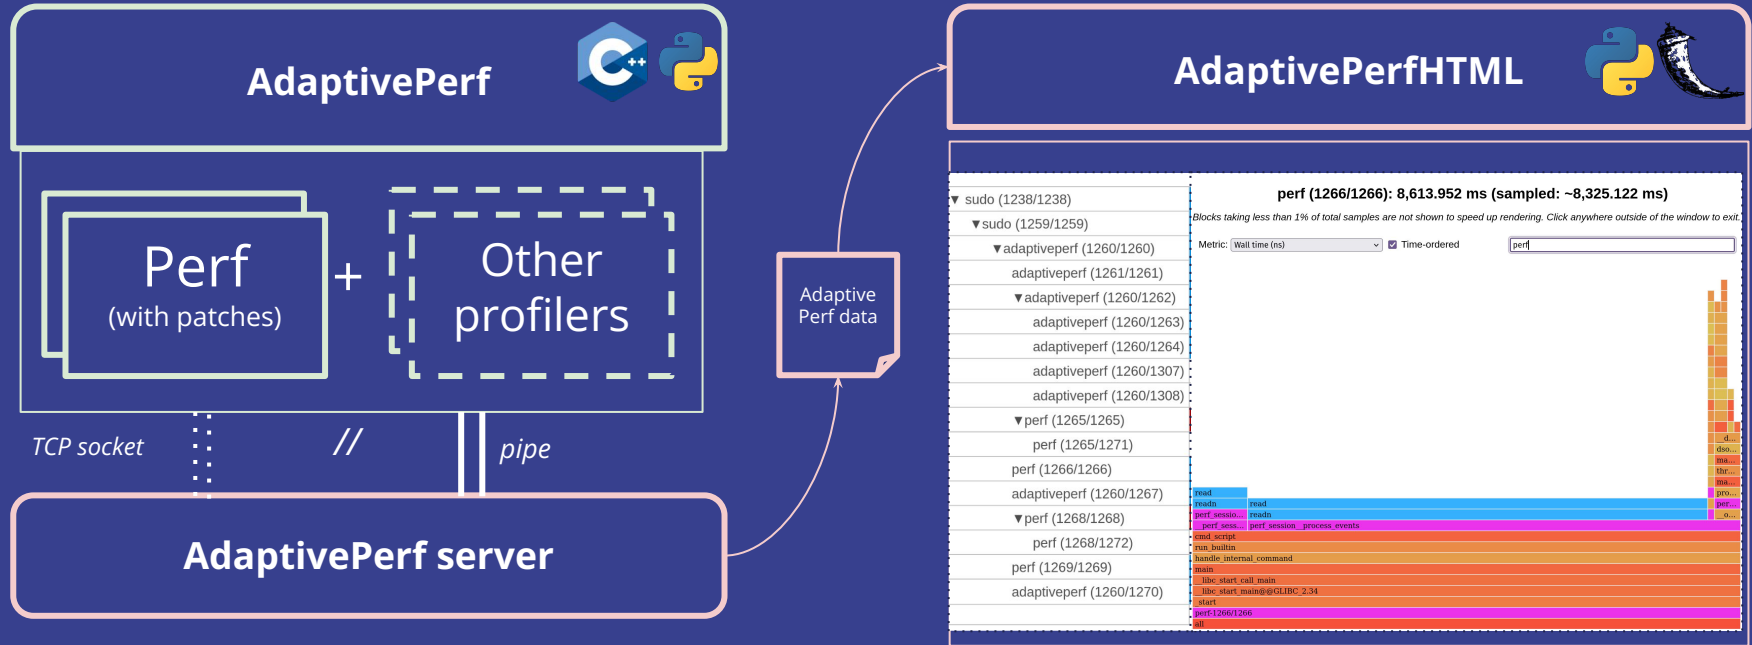

Consortium Members

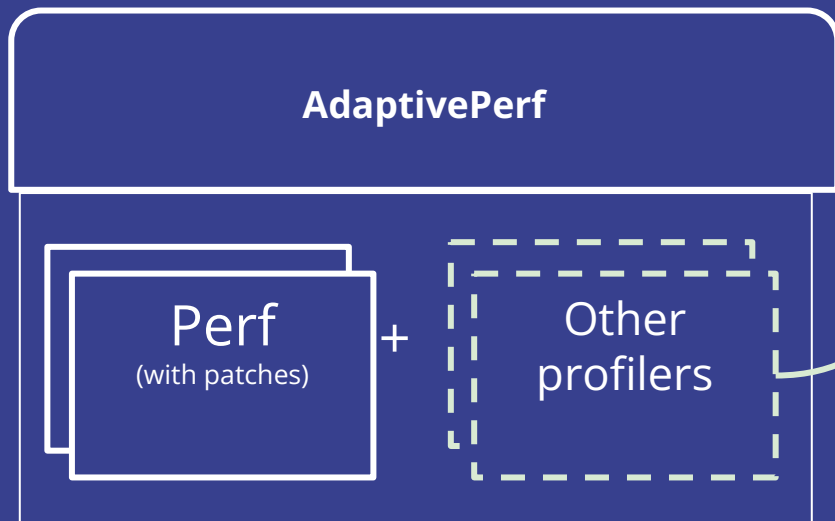

UNIVERSITÄT
HEIDELBERG
ZUKUNFT
SEIT 1386

What is AdaptivePerf

Perf: Linux profiling with performance counters 

Purpose of the metric profiler

TURBOSTAT

```
# powerstat
```

Support for continuous (non-integer) metrics.

Ex: power consumption, CPU temperature

How to use the metric profiler

Program the user
wants to profile

command that will
output a metric value

sampling frequency
(optional)

```
$ sudo adaptiveperf "myprogram" -m c:"powerstat",n:"power",f:"100",r:"[0-9]+"
```

metric option

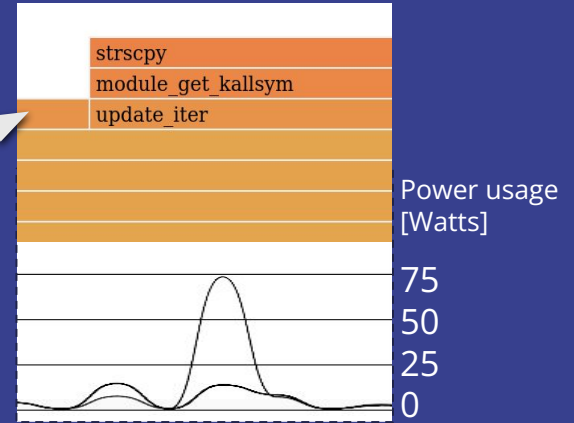

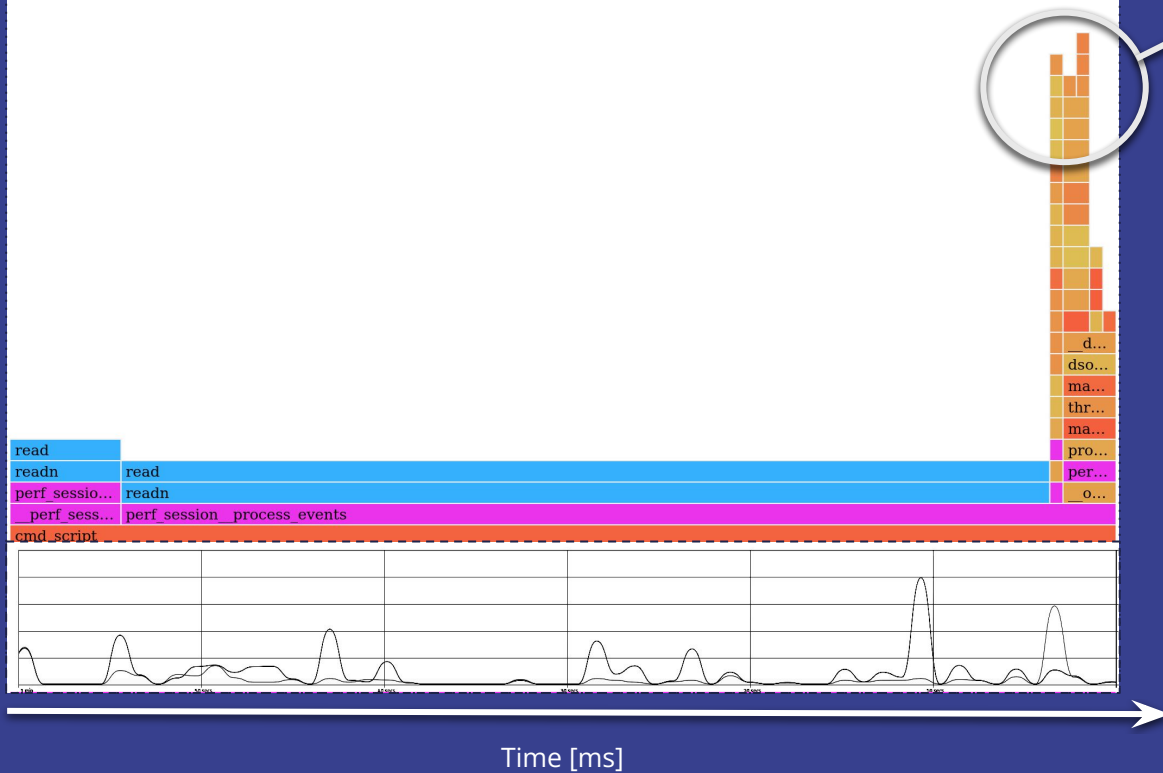

name/alias for
the metric

regular expression to
parse the metric
command (optional)

perf (1266/1266): 8,613.952 ms (sampled: ~8,325.122 ms)

Blocks taking less than 1% of total samples are not shown to speed up rendering. Click anywhere outside of the window to exit.

Metric: Time-ordered

Challenges

Challenges	(Possible) Solutions
Reducing profiling overhead	Process as much as you can in parallel
Synchronizing data from different profilers	Add timestamps to each sample
Finding the right tools for measuring power usage / CPU temp / GPU temp	Survey Existing Tools and APIs. Other tools might include lm-sensors, nvidia-smi
Displaying data in an intuitive manner	Try to map metrics to specific instructions

Future work & Conclusions

Enhanced Visualization Options:

- **Heatmaps or dynamic graphs** to provide a more intuitive understanding of performance bottlenecks and signal fluctuations over time.
- **Combine different visualization types (flame graphs, histograms, etc.)** and metrics for more tailored analysis.

Thank you!
