Institute of Nuclear Medicine, U of Warsaw, Poland

Preclinical and clinical development: 25 year of research

Topics

- **How do we understand cancer today?**
- **Specific factors of malignant brain tumors (gliomas, glioblastomas)?**
- **Why do most solid tumors resist therapeutic efforts?**
- **How can radioactivity be used to treat cancer?**
- **How to apply a radiopharmaceutical to treat malignant gliomas**
- **How to produce therapeutic radionuclides, e.g. Actinium-225?**
- **How to apply targeted alpha therapy in malignant gliomas?**
- **How to overcome to impasse of clinical development in orphan disease?**

How do we understand cancer today?

- Cancer a genetic disease
- Gap between immense knowledge gain and therapeutic application

Cancer = genetic disease

Sporadic Cancers = acquired mutations

Syndromic = Hereditary Cancers

Sporadic : hereditary \approx 90% : 10%

**Tumor suppressor gene,
loss of function mutation**

- e.g. retinoblastoma gene

Cancer = genetic disease

Oncogene

Gene activating mutations

e.g. **Ras, EGFR**

Oncogenes and TSGs change signal transduction pathways

2 classes of cancer mutations

Tumor Oncogene: activating mutation

Tumor suppressor genes: recessive (2 hits for gene inactivation)

Functional Order in Mutant Cancer Pathways

Pathways

Proliferation

Genes/Mechanisms

RTKs/Oncogenes: EGFR, VEGFR etc

Apoptosis

p53/MDM/BCL-2 etc

Cell Cycle Regulation

CycD/CDKN2a/Rb etc

Migration/Invasion

FAK, CD44, PTEN etc

Angiogenesis

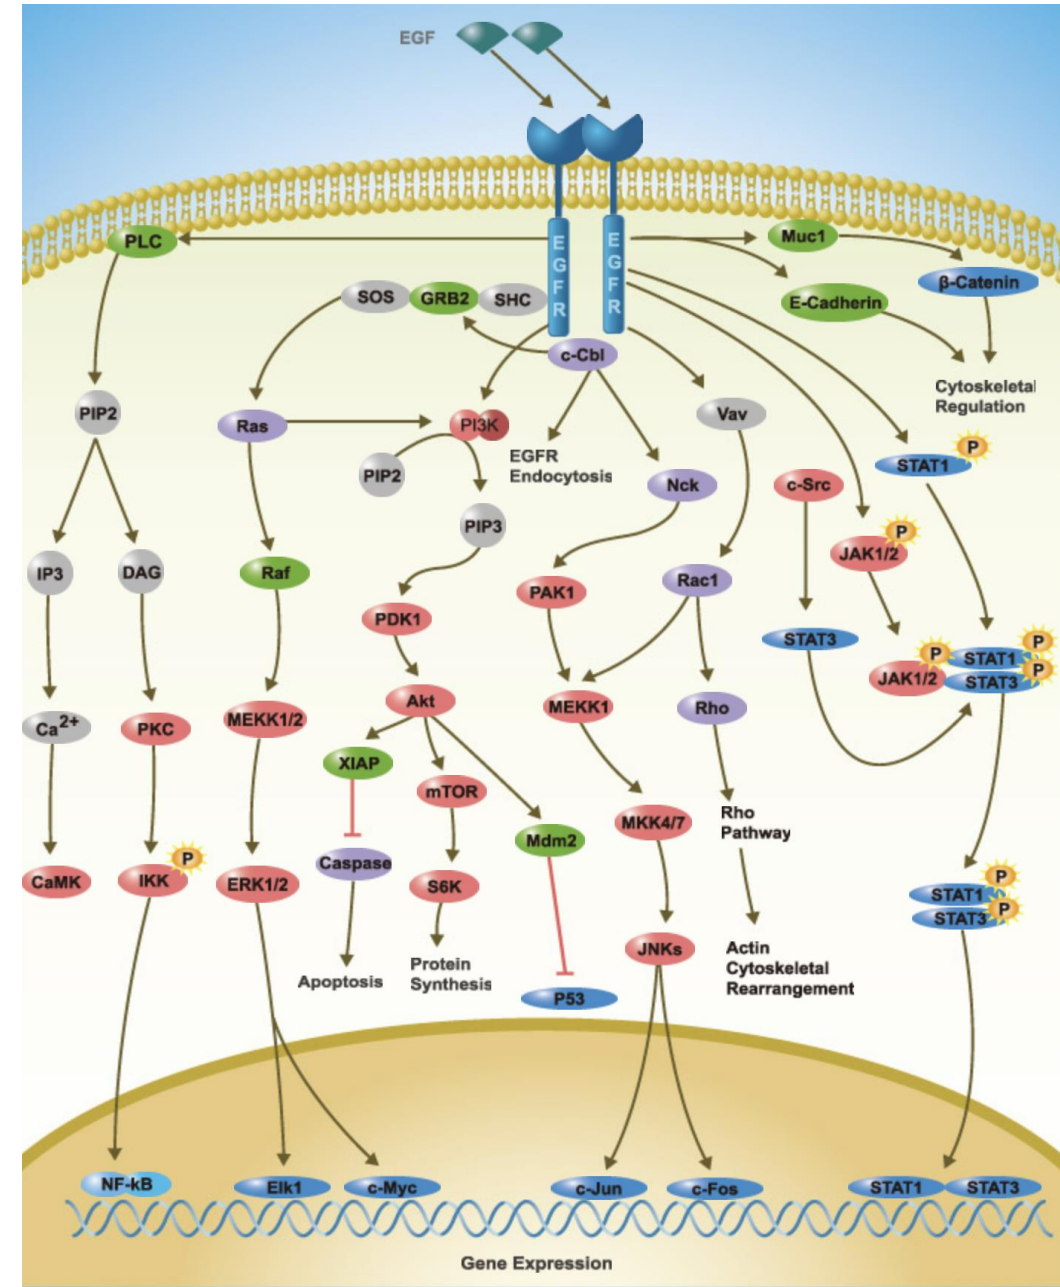

VEGFR, Ang2, STAT3 etc

Metabolism

Glycolysis, *Isocitratdehydrogenase*

Epigenetics / Histone-DNA Methylation /
non-coding RNAs: micro, longer, circular

Regulation of gene expression with altered cell signalling...

28,076 Tumors · 221 cohorts · 66 Cancer Types ·
203,003,747 Mutations

568 Cancer Genes across 66
Cancer Types

- Human genome: 3 Mia base pairs
- On average 7230 mutations per tumor
- About 10 cancer genes per cancer type
- Most mutations the result of genetic instability!
- Dysfunctional DNA repair

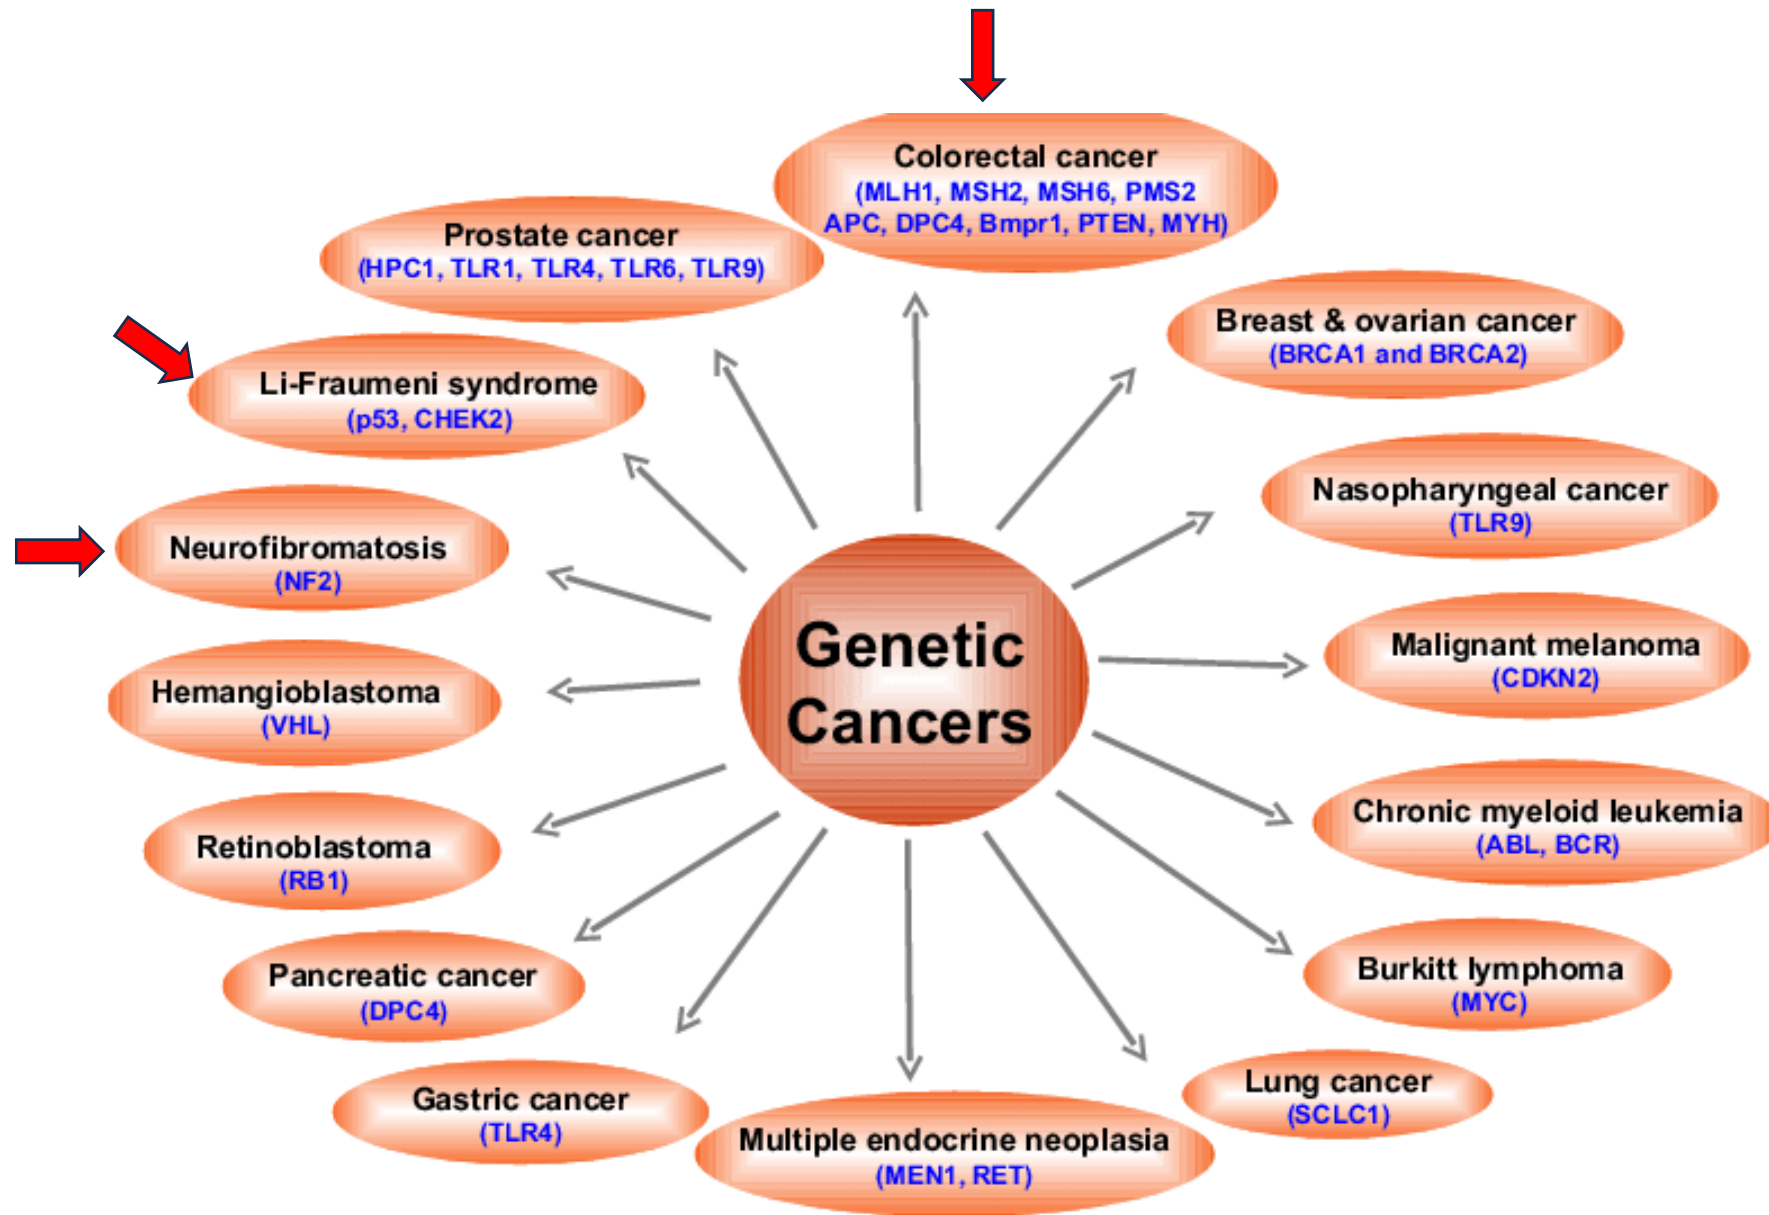

Limitation:

A few therapeutically relevant mutations known at present

Bcr-abl: Glivec

B-raf mutations

etc.

➡ Hereditary cancer syndromes: occurrence of malignant gliomas

Specific factors of malignant brain tumors (gliomas, glioblastomas)?

- Classification of glioma
- Glioma genetics: prognostic, but not therapeutic implications

Normal brain development

Brain Tumorigenesis

Glial restricted precursor cell

Acquired mutations

Genetic instability

Genotype change

Phenotype change

cell division

cell migration

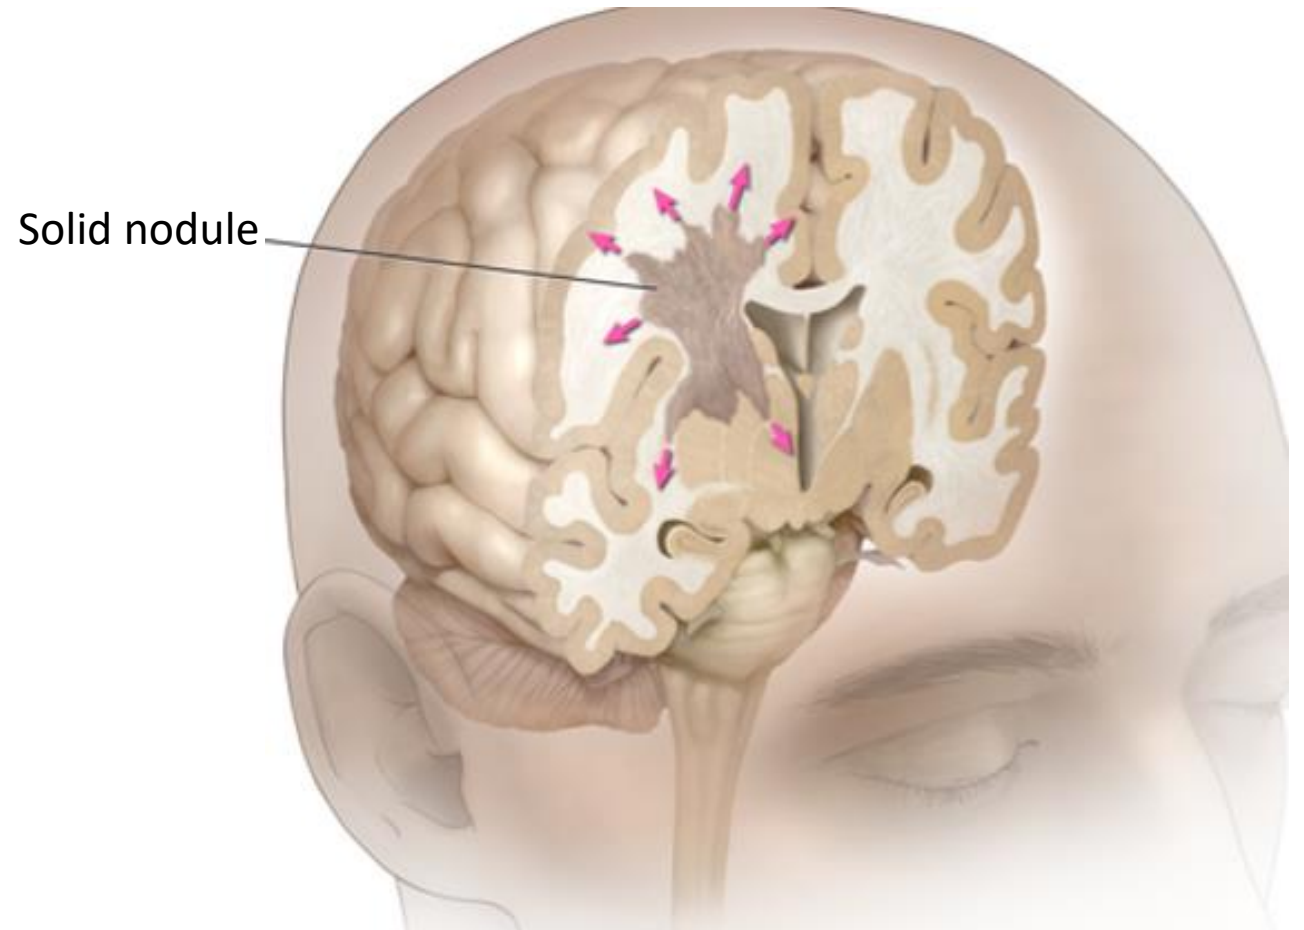

ECM change

Malignant Glioma WHO II-IV

= 2 component disease

- **Tumor nodule** (surgery?)
- **Invasive tumor cells** (?)

Peter Burger

Pathologist Duke/JHH
Sabbatical USZ

Whole Brain Cuts of GBM patients
Microscopic Analysis
Visualization of Invasive Cells

Glioma = Whole Brain Disease!

Malignant Gliomas: Brain Intrinsic Tumors: Orphan Disease 3-4 cases/100'000/y

Kaplan-Meier survival curve

Grade 4 Gliomas
Median Survival Time 12-15 months
about 50% of patients die within 1 year

IDH-mutant astrocytoma grade 2

«better» survival time: median about 5 years

Normal brain

Astrocytoma grade 2 (mild hypercellularity)

Malignant astrocytoma grade 4 (glioblastoma)

Necrosis, vascular proliferation, hypercellularity

Glioblastoma Allelotype: Trisomy 7, Loss of Chromosome 10

IDH 1,2,3 (isocitrate-dehydrogenase) associated with astrocytoma II, secondary GBM

mitochondrial energy production (Krebs-Cycle)

Normal function: oxidative decarboxylation of isocitrate to α -ketoglutarate

Mutant IDH: production of 2-hydroxyglutarate =
= **oncometabolite**: changes methylation of histone and DNA structure, **modifies gene expression patterns**

IDH1 mutations: R132H (Arg-His), most frequent

Hans Adolf Krebs
German biochemist
1937 discovery
1954 Nobel prize

Therapeutic obstacles...

Why do most solid tumors resist therapeutic efforts?

Biophysical factors, tissue penetration of drugs

Two of the most malignant human malignant neoplasms

GBM

Pancreas-CA

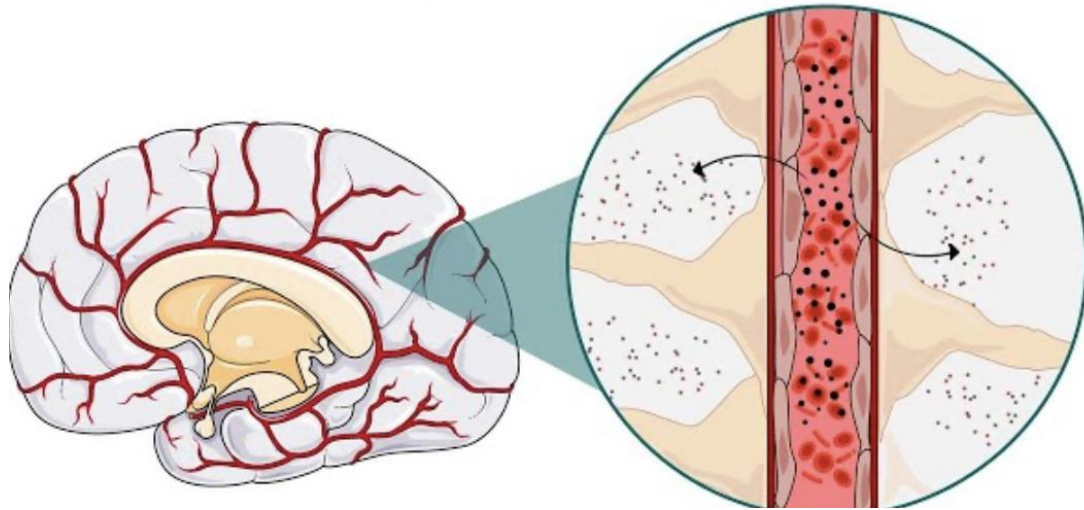

Solid tumors in general? GBM, pancreas CA, malignant melanoma, ovarian CA etc

Genetic, anatomical and biophysical factors of therapeutic resistance?

Anatomical factor of therapeutic resistance in the brain

Blood-Brain Barrier

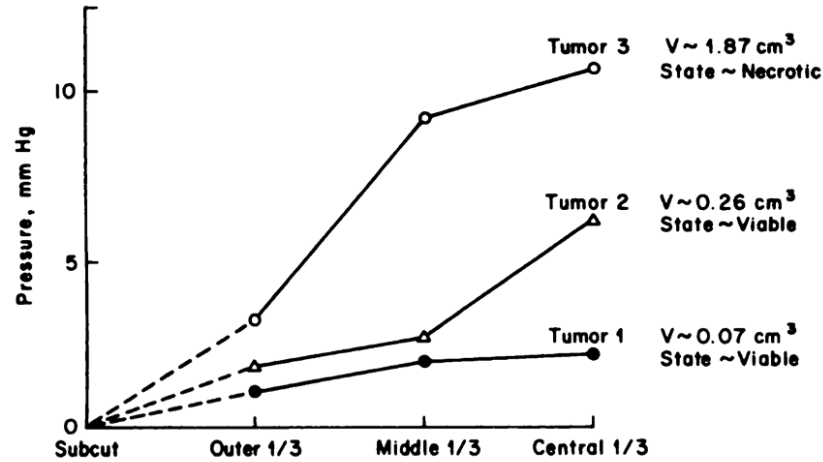

Grade 2: BBB **closed!**

Grades 3-4: BBB **partially open**

BBB: active transport, lipiphilic compounds

Biophysical factors of therapeutic resistance

The larger the tumor grows,
the higher the interstitial pressure

Intratumoral pressure > interstitial pressure (normal: 5-15 mmHg / 7.5-20 cm H₂O)

capillary and venular collapse (decreased accessibility of drugs?)

R Jain. Barriers to drug delivery in solid tumors. Scientific American 271 (1), 58-65

R Jain, T Stylianopoulos. Delivering nanomedicines to solid tumors. Nature reviews Clinical oncology 7 (11), 653-664

Biophysical factors of therapeutic resistance

The larger the compound (dextrane),
the worse the diffusion

Vector size

Monoclonal antibody: 155'000 Daltons

Peptide vector: 1800 Daltons

How can radioactivity be used to treat cancer?

- The Marie Curie experience
- How to make the static seed approach dynamic
- Bifunctional molecules for tumor targeting
- Targeting gliomas (defining the appropriate vector)

Marie (1867-1934) and Pierre (1859-1906) Curie

1898 (Dec 26) detection of radioactivity separating uranium from uraninite

Radon-222
Iodine-125
Aureum-198
Iridium-192
etc

Breast CA, Prostate CA, Brain CA etc.

Seeds very **limited** to target
invasive tumor cells
Dose range mm

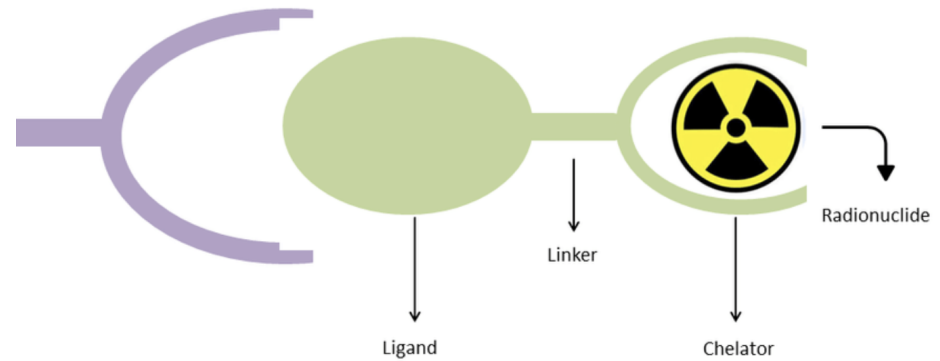

Static seeds

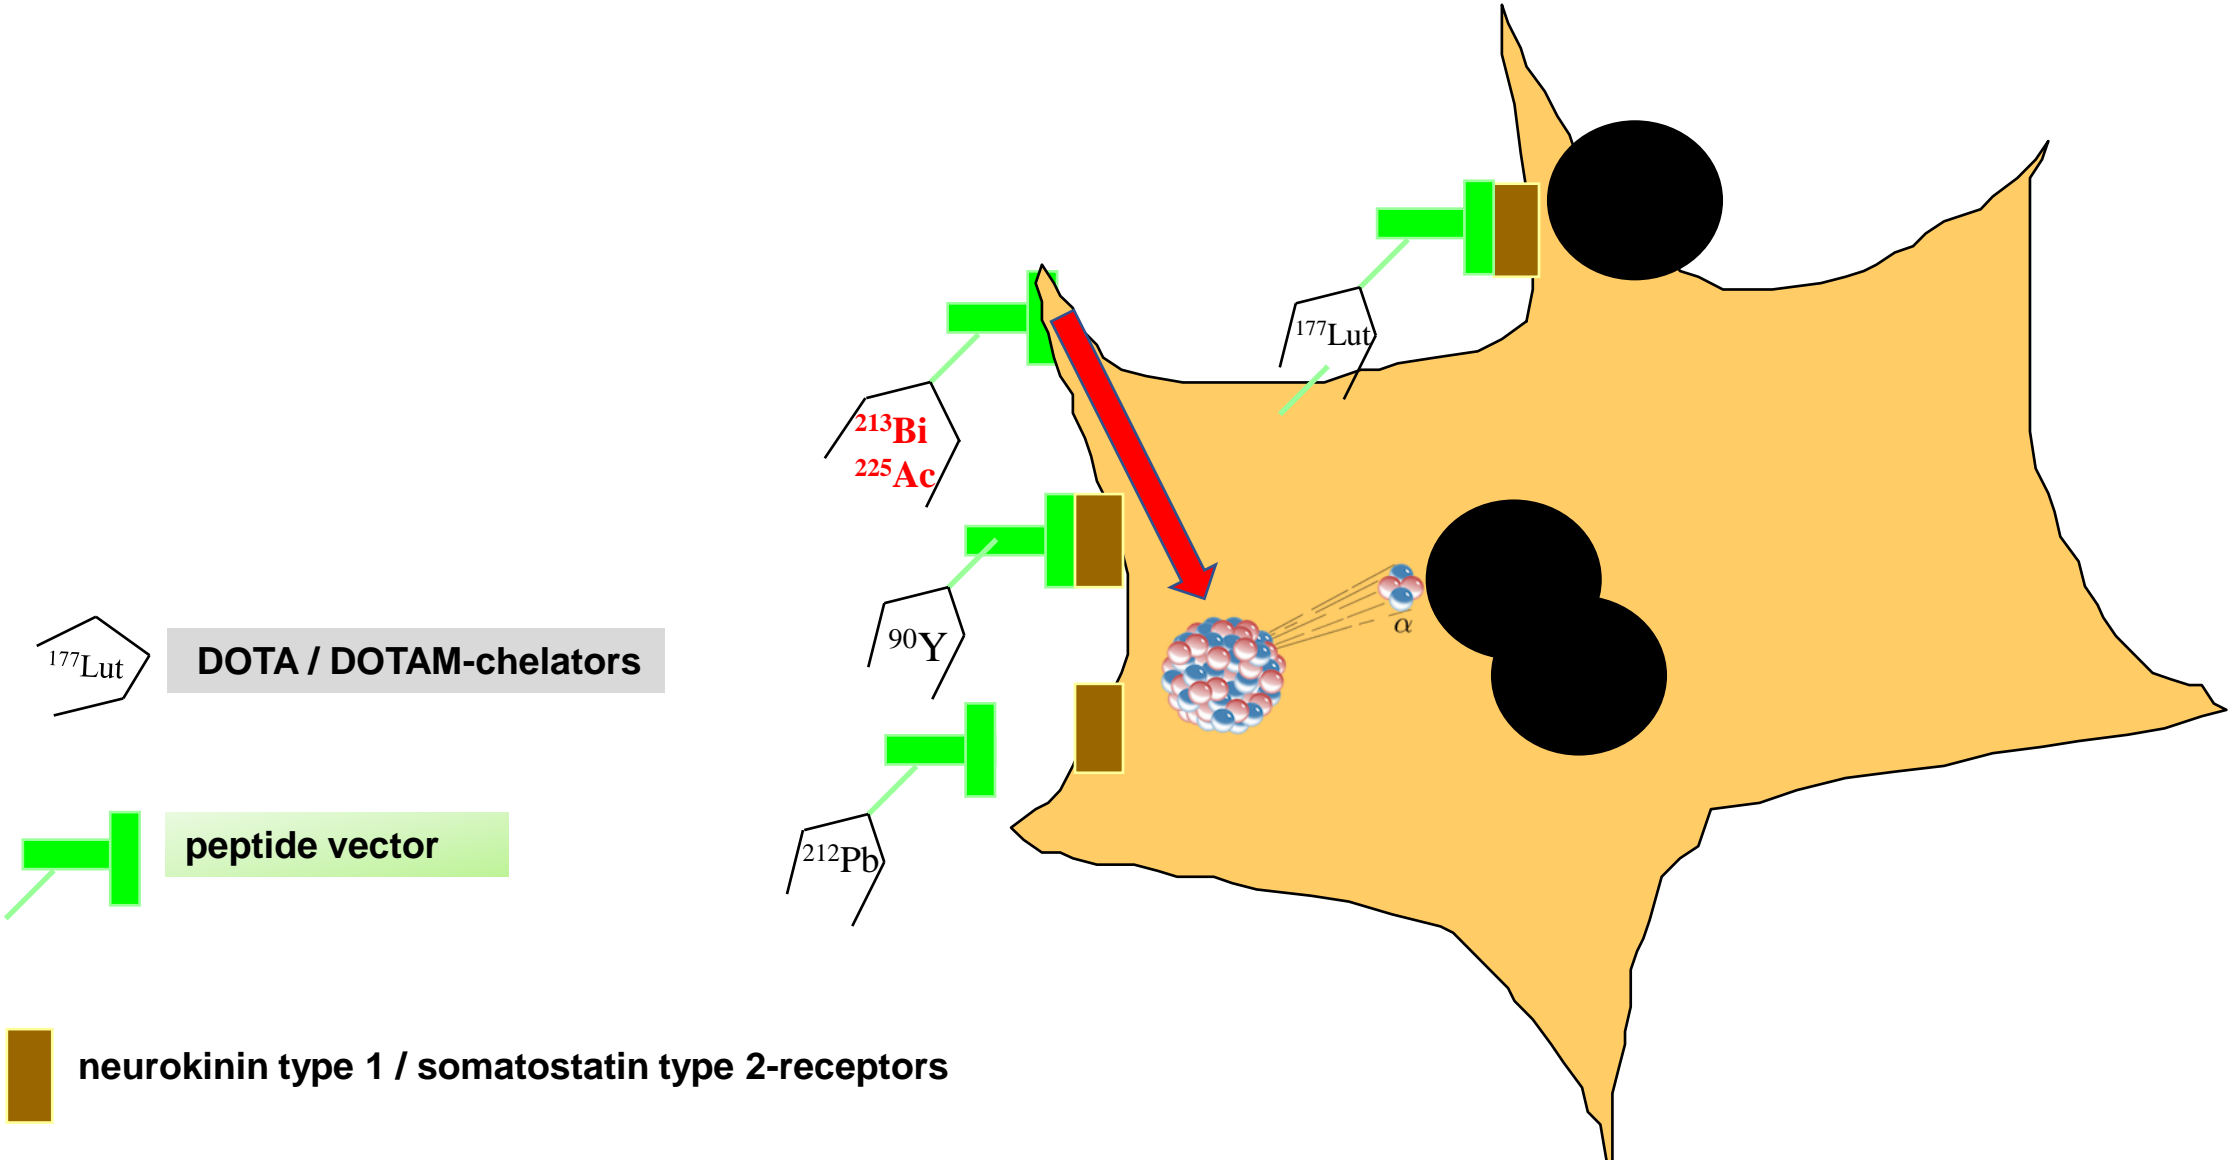

Receptor

Targeting Radiotracer

Dynamic peptide vector

Targeted DOTA-Radionuclide Peptide Radiotherapy

Bifunctional molecules

- Receptor binding domain (tumor cell binding)
- Effector domain (therapeutic radionuclide)
- ***Platform technology***

Clinical development steps

- **Preclinical:** definition of drug, drug target, biochemical assays, animal studies
- **Phase 1** trial: toxicity, safety
- **Phase 2** trial: dose finding, evtl efficacy
- **Phase 3** trial: comparison to state of the art (randomized trial)
- **Phase 4:** clinical application after market authorization
- **Phase 2b/3:** oncology, dose finding, efficacy, market authorization (orphan)

Selection of an optimal targeting vector

Result of 4 clinical phase-1 trials over a period of 10 years!

- Anti-BC-mAB: 155'000 D: **too large, poor diffusion**
- **DOTATOC**: 1300 D, excellent size, but **not specific** (neuropil), **kidney**: tubular re-uptake
- **Substance P**: **specific in brain** (expression in tumors, inflammation, trauma, hemorrhage)
- **Modified Substance P**: limited blood passage, no kidney uptake!

Size: rapid diffusibility

Specific target binding: compartment

DOTA-modified Substance P

$^{213}\text{Bi}/^{225}\text{Ac}$

1800 Daltons

[X] - DOTA - modified Substance P
Radionuclide *Chelator* *Peptidic Vector*

Substance-P (NK-1) receptor autoradiography

H&E

Substance P

control

10'000-50'000 NK-1 receptors / glioma cell (grades 2-4)

Preclinical testing

Binding in low-nanomolar range

Competitive binding assay

How to apply a radiopharmaceutical to treat malignant gliomas

- **Local application versus systemic (i.v., i.a.) injection / diffusibility**
- Compartmental specificity to limit toxicity
- Synthesis and size of the targeting vector / receptor affinity

Brain Tumor Targeting:

The most efficient mode of drug application?

Intravenous – intraarterial – intratumoral (interstitial)?

Testing circular vector DOTATOC (8AA, 1300 D)

i.v. \approx i.a.

Systemic = intravenous or intraarterial injection:
 < 5% of injected activity reaches the tumor (systemic radio-toxicity)

Intratumoral=interstitial

Injection	K / T^b	T / B_{head}	T / B_{abd}	K / B_{abd}
i.v.	29.40	0.65	0.43	12.60
i.a.	26.41	0.80	0.55	14.66
i.t.	0.03	18.31	61.25	1.58

^a 100–190 MBq.

^b K , kidney; T , tumor; B_{head} , cephalic background; B_{abd} , abdominal background.

Astrocytoma grade 1-2:
Intracystic injection of In-111 DOTATOC
40% loss of injected activity /24hrs

^{111}In -DOTATOC
1300 Daltons

i.v.

i.a.

i.t.

30min

*injection volume
2ml*

i.t.

24/48hr

2D SPECT

MRI

intravenous

Kidney uptake:
DOTATOC-PET

Kidney, the dose-limiting organ

in octreotide-based systemic approaches

Intratumoral (intracerebral) injection

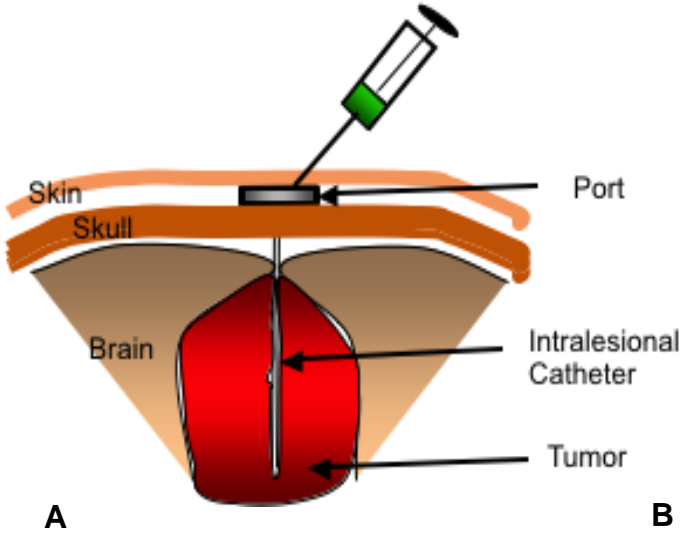

No kidney uptake: only slight bladder signal

Modified substance P

Linear peptide 11 AA, cleaved by serum **peptidases**,
modified (prolonged half-life 4x), only peptide fragments in systemic circulation,
Rapid clearance into bladder

Local application of the radiopharmaceutical the way to go!

Injection volume about 2ml

Astrocytoma Grade 2: **BBB closed, limited leakage**

Astrocytoma Grade 3-4: **BBB partially open, variable leakage**

Additional factors: open CSF spaces, post-RT

Grade 2

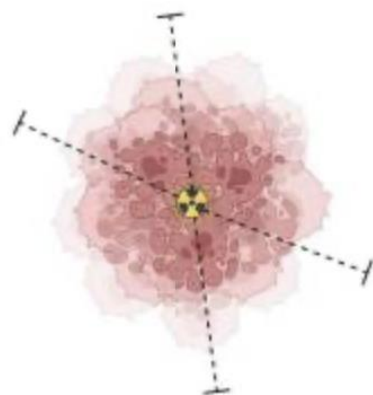

Grade 4

Selection of the appropriate medical radionuclide

- Beta-emitters
- Alpha-emitters

β -particle

α -particle

Auger electron

Mean energy	50-2300 keV	5-9 MeV	eV-keV
Path-length	Tumors, tissues (≤ 12 mm)	< 10 cells (50–100 μm)	< 1 μm
LET	< 1 keV/ μm	~ 80 keV/ μm	4-26 keV/ μm
Examples of radionuclides	^{161}Tb , ^{177}Lu , ^{90}Y	^{149}Tb , ^{225}Ac , ^{223}Ra	^{123}I , ^{111}In

Dose Range, Dose Decay Curve, Tumor Cell Size 20-60 μm

± 0.08 mm alpha-particles / 5.84/8.5 MeV

Beta: 1 mm Lutetium-177 / 0.13 MeV

Beta: 5 mm Yttrium-90 / 2.1 MeV

10 mm GammaKnife

10-20 mm Photons

Tissue range (alpha:beta) 1:10 (Lut-177) to 1: 50 (Y-90)

Toxicity profile!

alpha-emitters (0.1mm)

beta-emitter Lutetium-177 (1mm)

Can we perform a large clinical trial
with targeted alpha therapy?

The bottleneck for alpha therapy

Insufficient supply with alpha emitters world-wide

2018 Vienna Conference IAEA / ITU:

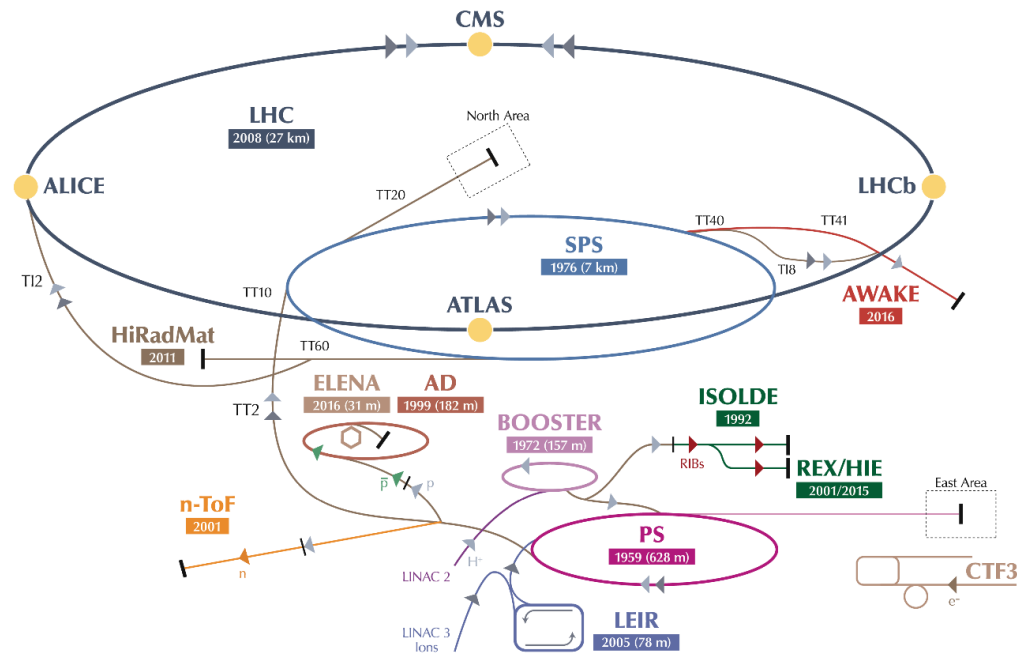

consensus to develop Ac-225 for clinical trials

Example Actinium-225

- Extract from Thorium-229 (TerraPowerProject, ITU Karlsruhe, Obninsk, DOE)
- Irradiate Radium-226 with Cyclotron (robotic reactor technology, Prague E&Z aso)
- **Spallation** (CERN-ISOLDE, NorthStar, Troitzk etc): produce period table! 2% Ac-225
 - Problem of chemical separation: **Contamination with 1% Ac-227** ($t_{1/2} \approx 20$ years)

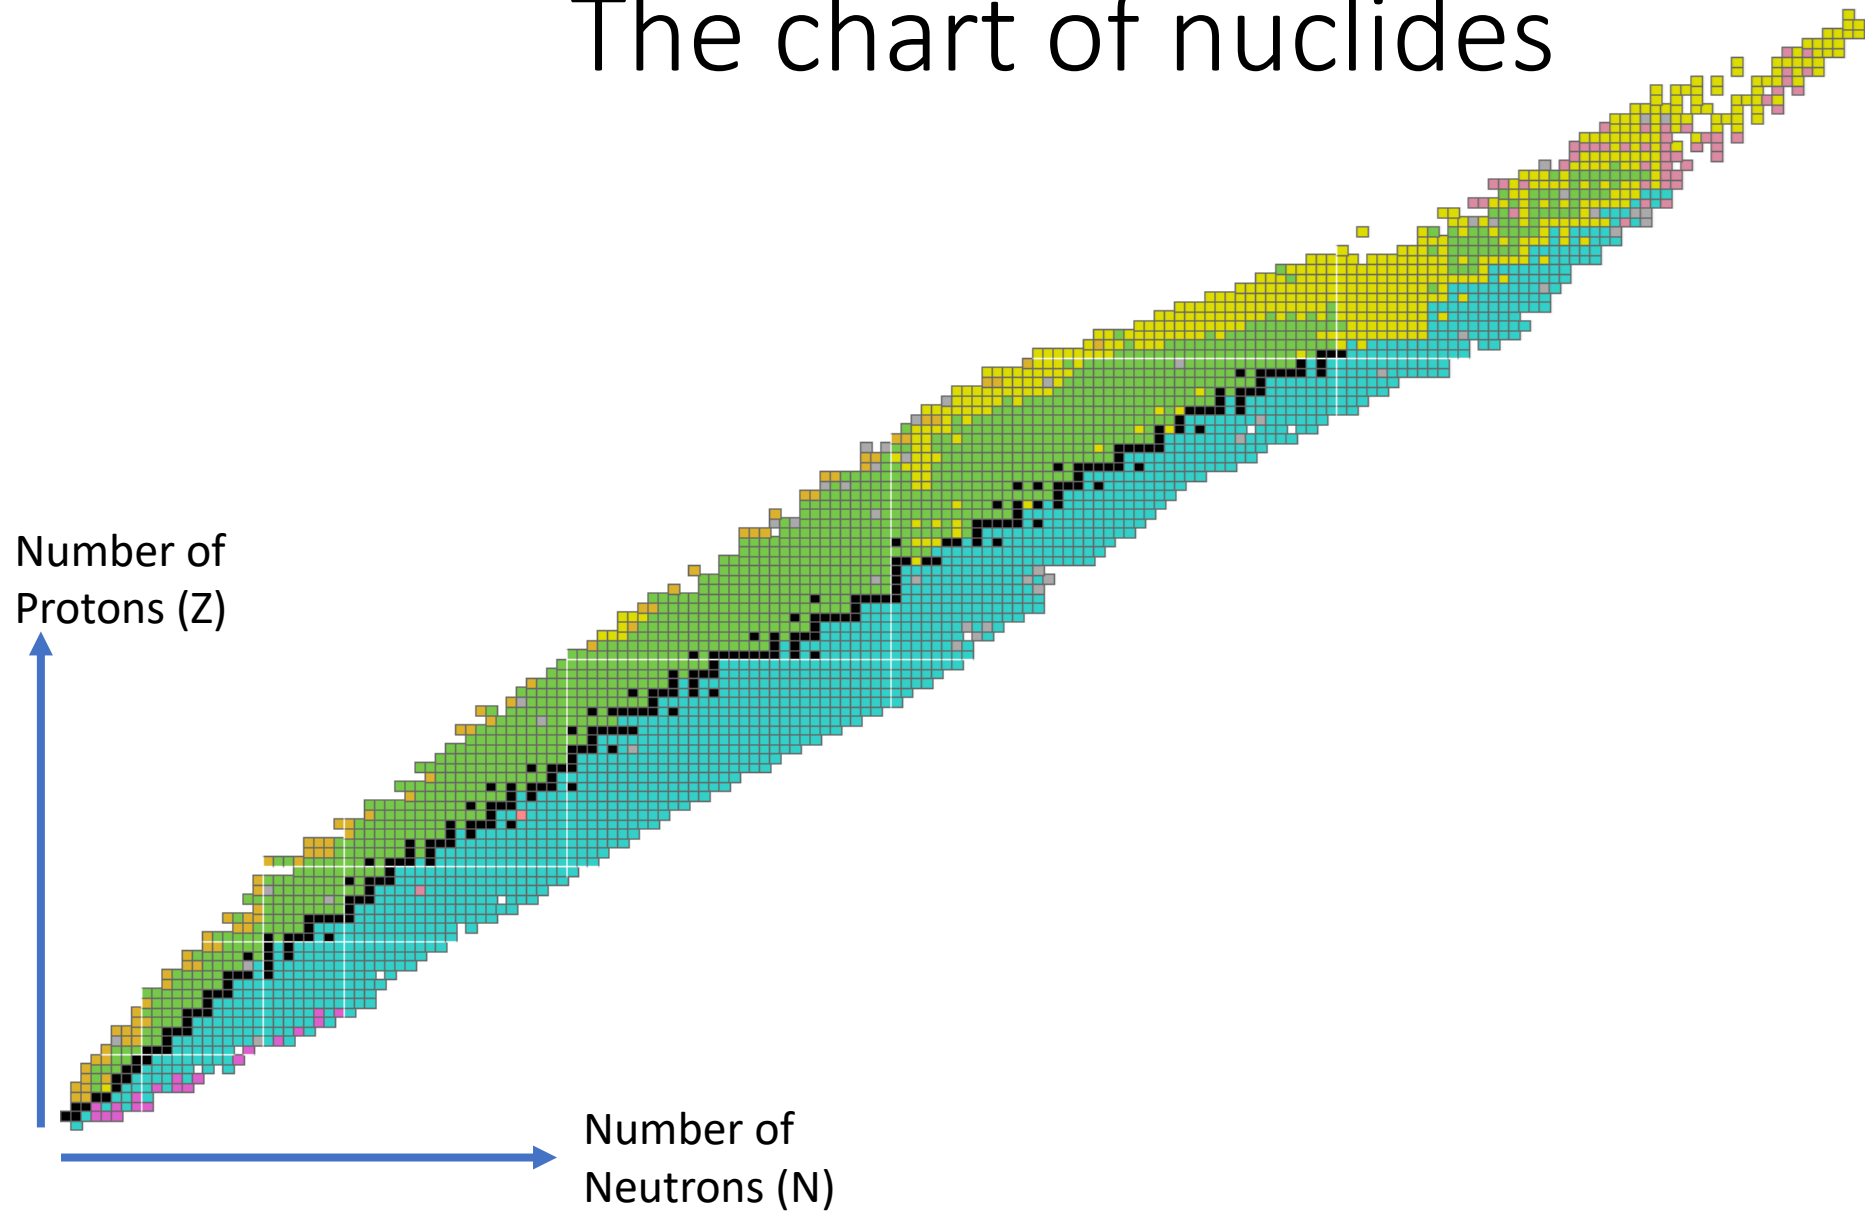

ISOLDE and MEDICIS

- Isotope mass Separator **O**n-**L**ine **D**evice
- Located at Proton-Synchrotron Booster (PSB)
- Study of fundamental atomic and nuclear physics

- MEDICIS (Medical Isotopes Collected from ISOLDE) → focus on medical applications exclusively!

The chart of nuclides

THE CHART OF NUCLIDES

The chart of nuclides

Starting with uranium (92 protons and >140 neutrons) many lighter elements and their isotopes can be produced, e.g. Actinium 225: 89 protons and 136 neutrons)

Number of Protons (Z)

Number of Neutrons (N)

Radioactive decay

The **colorful boxes on the chart of nuclei** indicate the isotopes of an element which are not stable
What does this mean: not all configurations of protons and neutrons remain together → a **decay** follows through which the isotope loses energy and transforms into another one

Alpha decay: He atom (2p+2n) gets emitted

Beta (plus/minus) decay: electron or positron gets emitted and either proton transforms to neutron or vice versa

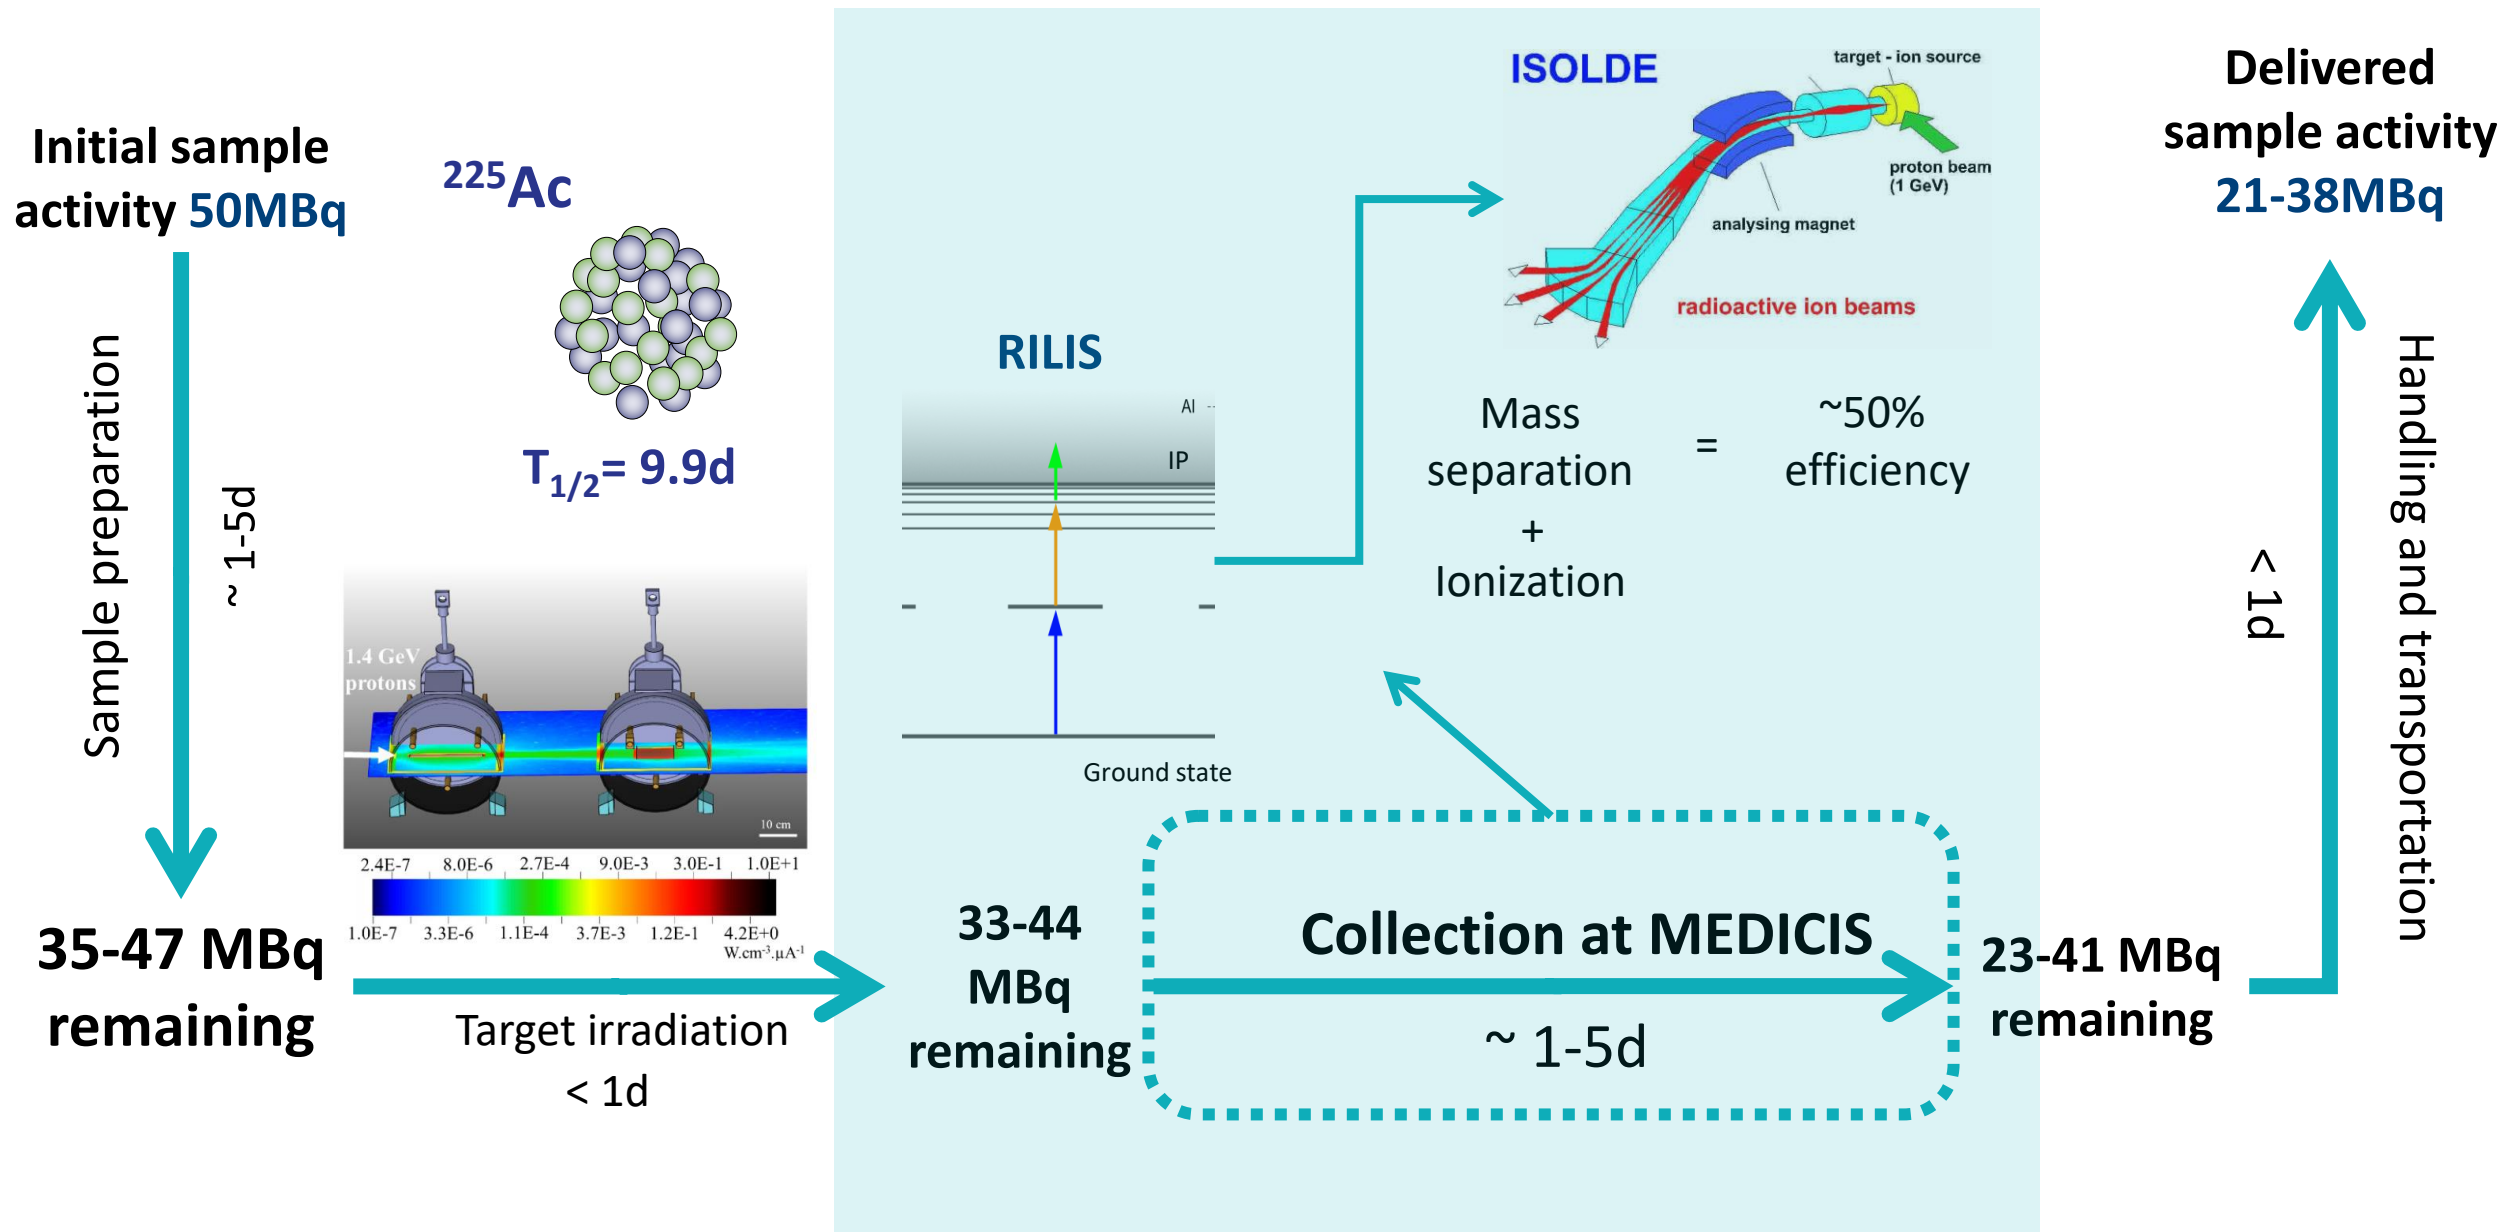

Gamma decay: de-excitation through emission of photon

⚡ photon ● neutrons
● electron/positron ● protons

With a given isotopes, **the half-life** defines after which time half of the isotopes will have undergone the decay → **unit** is “Bequerel” (**Bq**) and is given in decays per second

Radioisotope production at MEDICIS - lifecycle

How to apply targeted alpha therapy in malignant gliomas?

- **TAT for low grade gliomas: a new treatment paradigm?**
- TAT for glioblastomas, how to develop a clinical protocol?

Case presentations: low grade glioma

Diffuse invasive astrocytoma grade 2 (IDH-mutant)

Median Survival Time: 5 years

Xuezhi Dong *et al.* "Survival trends of grade I, II, and III astrocytoma patients and associated clinical practice patterns between 1999 and 2010: A SEER-based analysis". *In: Neuro-Oncology Practice* 3 (1 Mar. 2016), pp. 29–38.

E/m (Gray) \approx energy per tumor volume (=mass)

Small tumor volume

$E_{\text{early}}/m_{\text{early}}$

Large tumor volume

$E_{\text{late}}/m_{\text{late}}$

Early intervention: the same amount of energy is much more effective with minimal side effects

31-year old Australian computer scientist

repetitive focal seizures (hand, speech)

Very long recurrence-free survival times in diffuse astrocytoma patients II (median survival 5 years)
 (Bayesian approach)

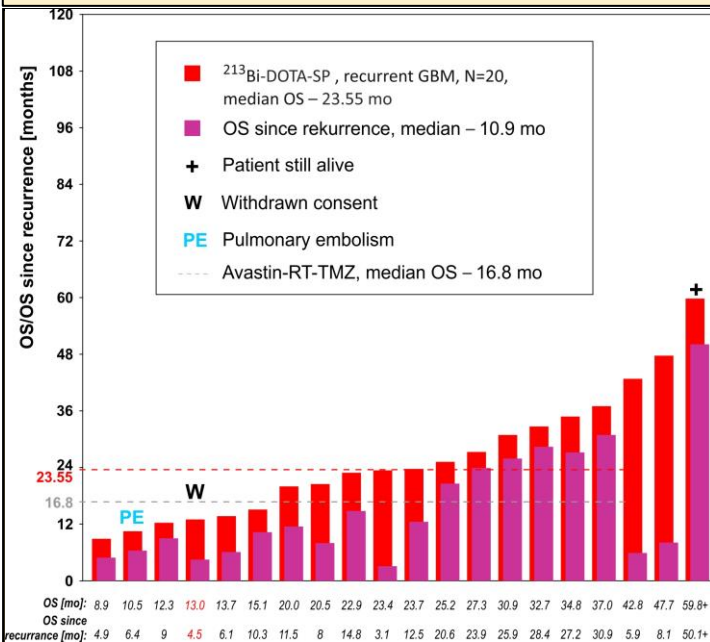

QALY: Karnofsky (0.1-1) x Survival (years), compare GBM 4 years survival gain, e.g. 0.7 x 3 = 2.8
 Estimate of socio-economic impact of a given treatment

How to apply targeted alpha therapy in malignant gliomas?

- TAT for low grade gliomas: a new treatment paradigm?
- **TAT for glioblastomas, how to develop a clinical protocol?**

Results T α T on recurrent GBM

- **WUM:** > 100 GBM patients treated (**published**), phase 1 and 2 including dose finding completed, **all cases recurrent GBM**
- 3 GBM recurrent studies: a) Bi-213 labelling b) Ac-225 labelling c) secondary GBM Bi-213 labelling
- protocol for phase 3 discussed with EMA, **corrected phase 3 protocol ready to go** (early adjuvant trial)

Waterfall diagram of survival times from 20 patients treated in Warsaw with Bi-213 DOTA Substance P.

Red: total survival times since diagnosis (median 23,5 months);

Violet: survival times following start of alpha therapy (median 10,9 months)

Subgroup analysis for inclusion criteria: **define target population** for phase III study

Best results obtained in patients if **tumor diameter ≤ 5 cm** and **Karnofsky score ≥ 70**

Total survival times in subgroup: **33,75 months**
Survival after start of alpha therapy: **27,8 months**

Standard SRCT Stupp et al: mean survival time for GBM 14.5 months

How to improve TAT response in GBM?

- Supply only every 8 weeks? Exponential growth, cell doubling < 7 days
- Do not wait until recurrence manifests in MRI!
- Acceleration of supply of Ac-225 every 2-4 weeks
- Early adjuvant TAT after end of standard RCT (supervised by EMA)

When is the best time point to apply TAT in malignant glioma?

Human body (70kg) 10^{14} cells

1000:1

Tumor (70g 4x4x4cm) 10^{11} cells

Surgery 99.9% removed
Residual Tumor 10^8 cells

How to overcome to impasse of clinical development in orphan disease

Profitability constraints and societal responsibility

Orphan disease: < 10 cases/100'000/year

Clinical Economic Development? „Black Hole“

- > 200 cancer types in humans, majority are **orphans** (<10 cases/100'000/year)
- **Ethical dilemma**: insufficient **profitability** for big pharma investors

Adam Smith
1723 – 1790

Capitalism and Free Enterprise

»It is not from the benevolence of the butcher, the brewer, or the baker, that we expect our dinner, but from their regard to their own interest.«

- **Disease is fate, not self-inflicted, social responsibility**

Clinical Economic Development?

- Disease: responsibility of the society as a whole (state and private benefactor)

Res publica

Caius Cilnius Maecenas 68-8 a.Chr.

Clinical Economic Development?

- **Model:** state/benefactor seed money to start ups in translational academic research units
- Incentive: **undilutable ownership in stock for the seed investor**, e.g. 30%
- **State and benefactor** assume the role of **business angel and primary investor**
- Estimate of success: 10 projects: 10 projects, 10 million seed money per project, success rate 1:10
 - 9 failures: loss of 90 millions
 - 1 success, value of 250 millions
 - gain for state/benefactor:** 250 Mio – 90 Mio ≈ **160 Mio**
 - reinvest 100 Mio (10x10)
 - 60 Mio for state (health care) and University (research, infrastructure)
- **Invite private and public investors** for development, market expansion etc (70% share in company)
