

Status and plans for the treatment of antibaryons in INCLXX, ...neutrinos, and uncertainties/errors

Jean-Christophe David

29th Geant4 Collaboration Meeting

07-11 October 2024 - Catania

Plan

- Antiprotons
- Antineutrons in INCL
- (light) Antinuclei in INCL

Bonus track

- Neutrino
- Uncertainties, errors (too early to discuss them, but...)

Why Antibaryons?

→ We have been asked to implement antiproton as projectile

- by people from **AD (Cern)** at rest (low energy - MeV)
physics of anti-matter (% matter)
new cross section measurements at ASACUSA
- by people from **PANDA (FAIR)** in-flight (higher energy - GeV)
study of $\Lambda\bar{\Lambda}$ interaction

→ And the **GAPS** (*) experiment might be interested in \bar{d} , $\bar{^3\text{He}}$.

(*) The General AntiParticle Spectrometer (GAPS) aims to study dark matter through sensitive observations of cosmic-ray antiprotons, antideuterons, and antihelium.

Antiprotons

In-flight

$$E_{\text{at rest}} = 200 \text{ MeV} < E < 10 \text{ GeV}$$

Main ingredients

- Cross sections
 - Elastic
 - Annihilation
 - Production
 - Charge exchange
- Final products (types; momenta)
- Potential (\bar{p})

At rest

$$E < E_{\text{at rest}} = 200 \text{ MeV}$$

Main ingredients

- Annihilation nucleon (p or n)
- Position of the Annihilation
- Final products (types; momenta)

Antiprotons Results

In-flight

$$E_{\text{at rest}} = 200 \text{ MeV} < E < 10 \text{ GeV}$$

Multiplicities

- Charged particles (total) ~OK
- Charged particles (w/ K^0) ~OK
- Charged particles (w/ Λ) To be improved

Spectra

- neutron OK

At rest

$$E < E_{\text{at rest}} = 200 \text{ MeV}$$

Multiplicities

- $\pi^{+/-}$, n, α OK
- p ~underestimate
- d ~overestimate
- t, ^3He underestimate
- Kaon To be understood

Particle Spectra

- OK

Residues

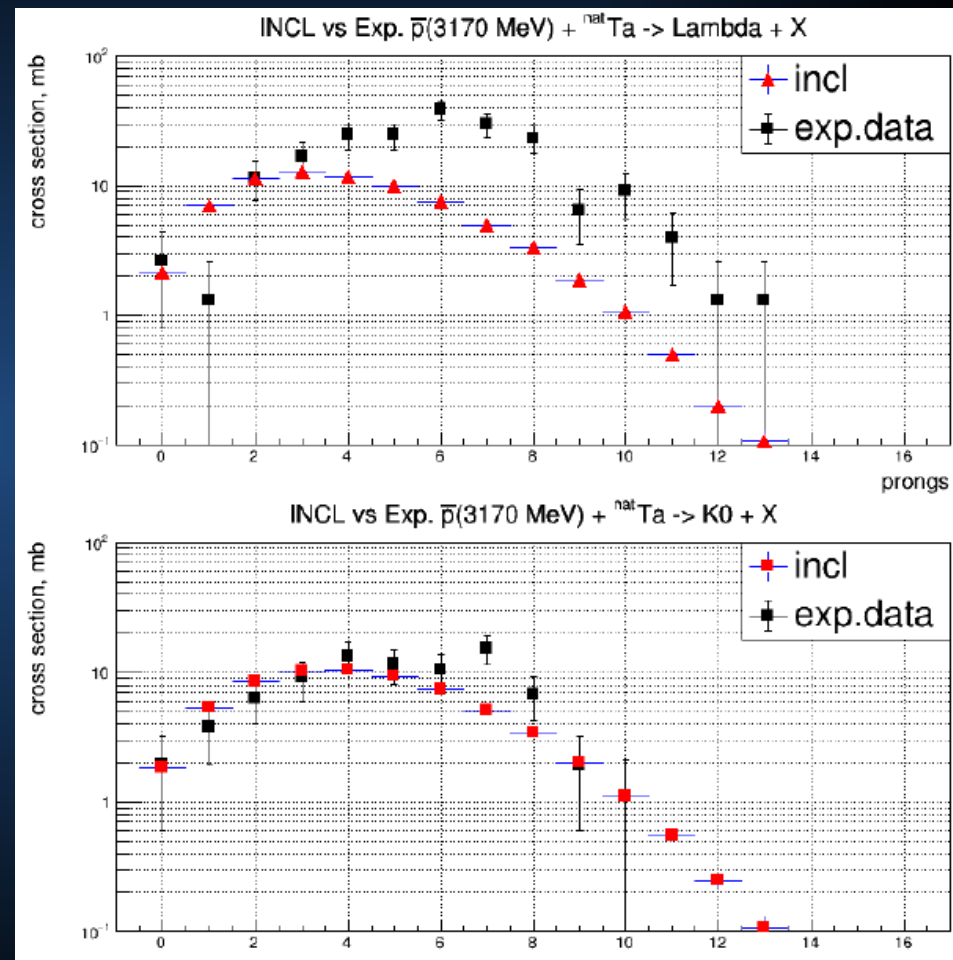

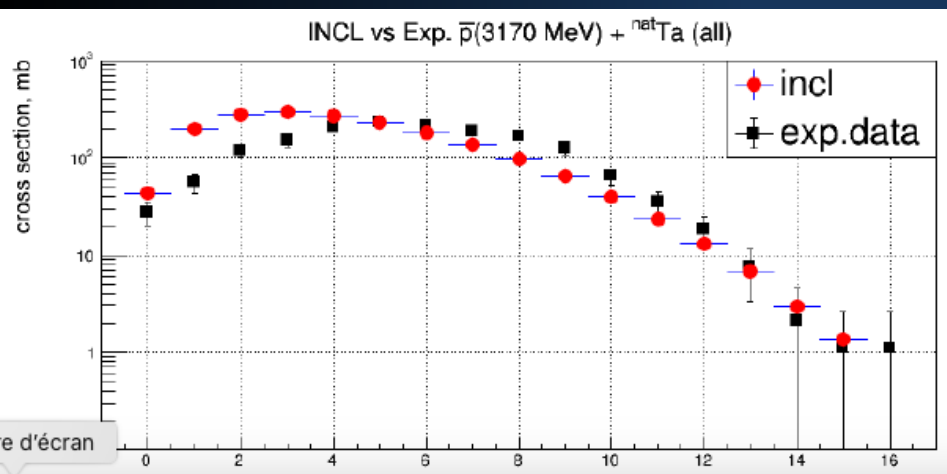

- OK

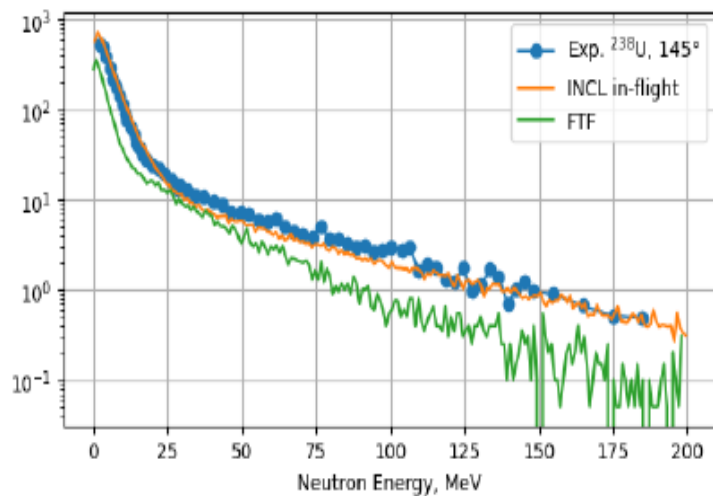

Antiprotons Results

In-flight

Multiplicities
(charged particles)

\bar{p} (4 GeV/c) + Ta

Antiprotons
ResultsSpectra
(neutron) \bar{p} (1.22 GeV) + ^{27}Al  \bar{p} (1.22 GeV) + ^{238}U 

Antiprotons Results

Multiplicities $\pi^{+/-}$

D. Polster et al.
Phys. Rev. C51 (1995)
1167–1180.

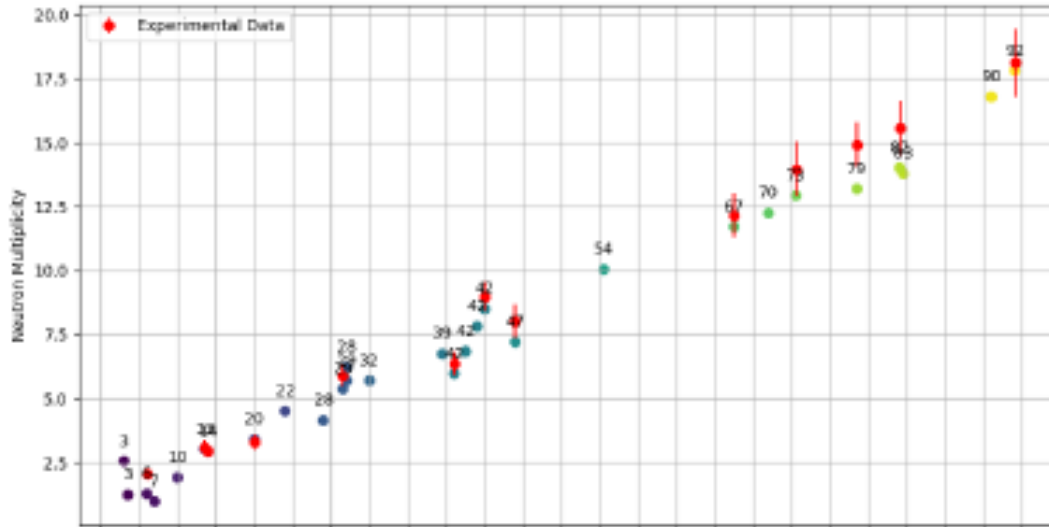

Quite good, except a little too low multiplicities (4% too low)

→ Lack of information on annihilation with (very) high meson multiplicity...?

Antiprotons Results

Multiplicities n & p

n

p

- n: ~perfect

- p: little underestimation (< 20%)

D. Polster et al.
Phys. Rev. C51 (1995),
1167–1180.

Antiprotons Results

Multiplicities d & t

d

t

- d: overestimation (< 25%)
- t: underestimation (< x2)

D. Polster et al.
Phys. Rev. C51 (1995),
1167–1180.

Antiprotons Results

Multiplicities ^3He & ^4He

^3He

- ^3He : underestimation ($< \times 1.5$)

^4He

- ^4He : rather good

W. Markiel et al. Nuclear Physics A 485.3 (1988), 445–460.

Antiprotons Results

Multiplicities ^3He & ^4He

^3He

- ^3He : underestimation ($< \times 1.5$)

^4He

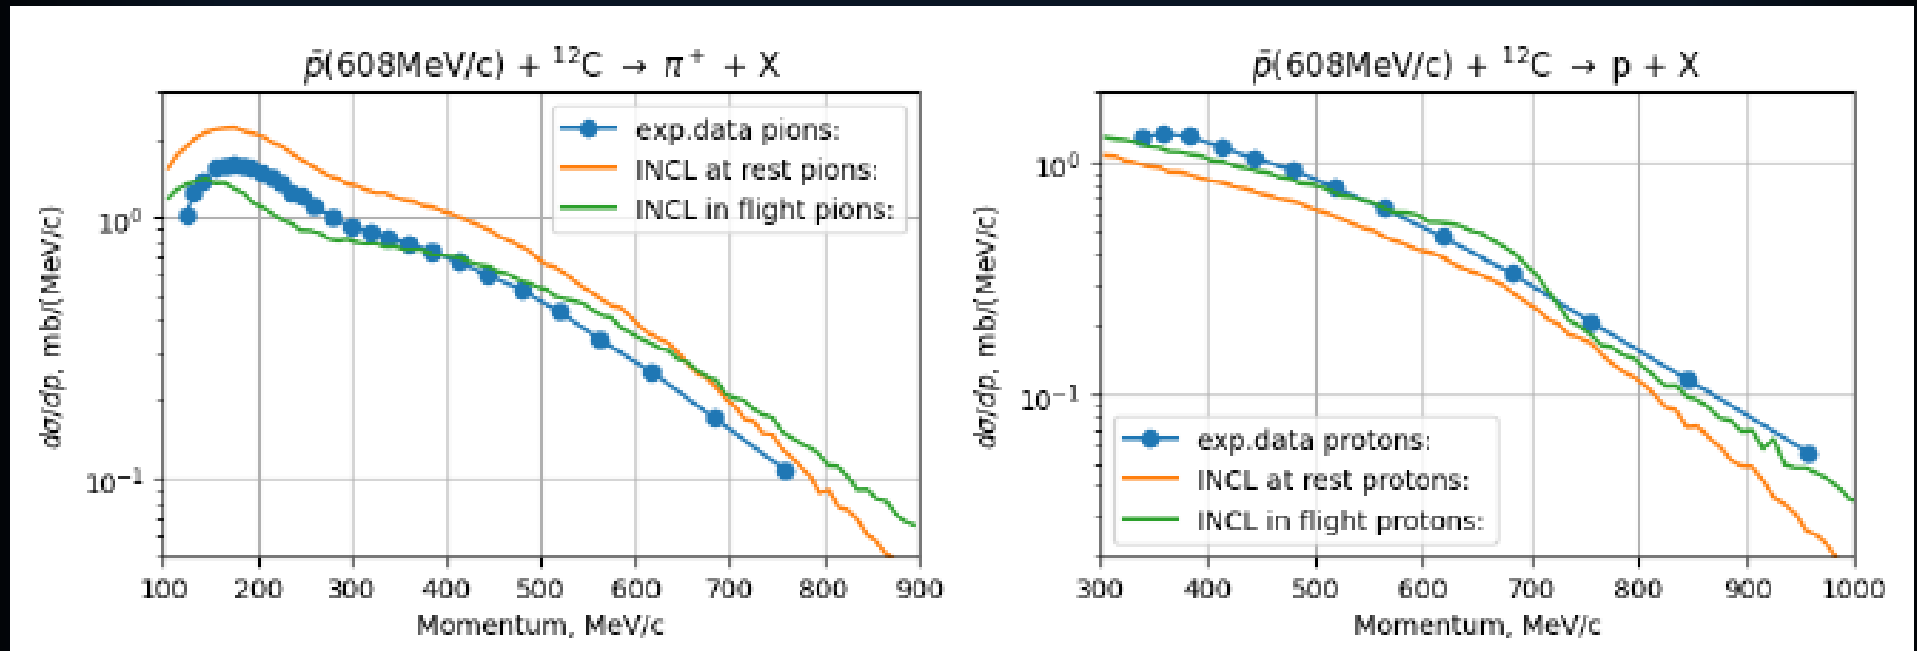

- ^4He : rather good

Here for given kinetic ranges...
INC (\rightarrow Coalescence model?)
Deexcitation?

W. Markiel et al. Nuclear Physics A 485.3 (1988), 445–460.

Spectra π^+ & pAntiprotons
Results

P. L. McGaughey et al., Phys. Rev. Lett. 56 (1986), 2156–2159.

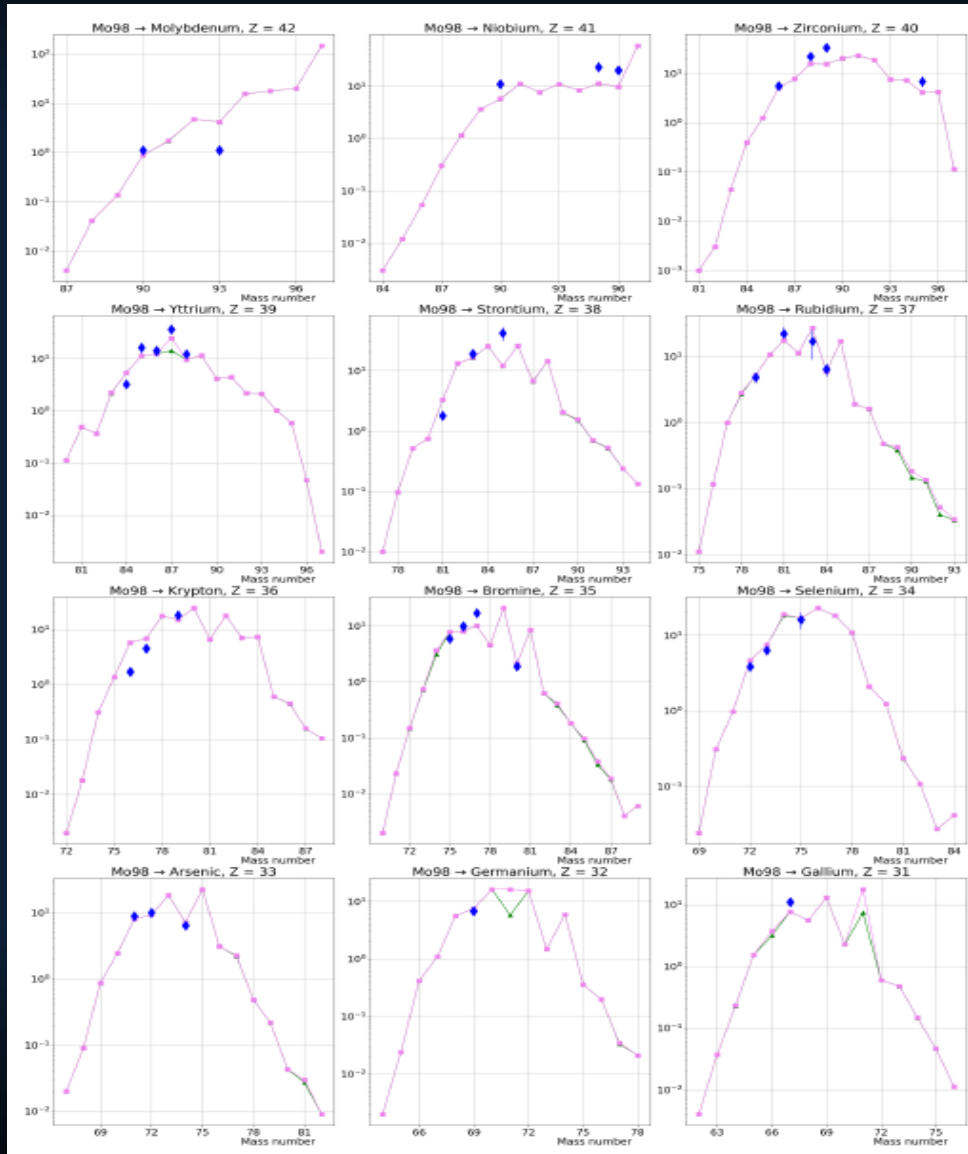

Shape \sim OK

π overestimate = artefact (INCL σ_{reac} too high here)

p underestimate as previously seen

Residue production

Antiprotons Results

Mass distributions
 $\bar{p} + {}^{98}\text{Mo} \rightarrow Z$

Figure 5.21: Cumulative isotopic distributions from the reaction $\bar{p} + {}^{98}\text{Mo}$. Calculated results are in violet (option $\frac{\lambda_{\bar{p}}}{\lambda_{\text{p}}} = 0.1$), and in green (option $\frac{\lambda_{\bar{p}}}{\lambda_{\text{p}}} = 0.5$). Definition of $\frac{\lambda_{\bar{p}}}{\lambda_{\text{p}}}$ in section 5.3.3.1. Data are from [Mos+89].

Here, cumulative production (progenitors accounted for)

Not bad at all, is it?

(same reliability as in p + A)

*E. F. Moser et al.,
Z. Phys.A –
AtomicNuclei 333, 89-105 (1989)*

Antiprotons Status

- In Geant4 (since Geant4-11.2)
 - Rather good results,
but place to improvements
 - π high multiplicities (refinement)
 - p ~underestimated
 - d overestimated; t and ${}^3\text{He}$ underestimated
 - K K^0 ~OK
 $K^{+/-}$ underestimated
 - Λ underestimated
- } new data
from AD (ASACUSA)
expected soon...
- Some not-so-well-known ingredients ...
(potential, position of the annihilation, on which nucleon (n? p?) the annihilation...)

Antineutrons

Beyond ~ 500 MeV/c $\bar{n} = \bar{p}$

Below

\bar{p} captured by electrons

\bar{n} should not be...

But

Exp. data exist only down to 100 MeV/c \rightarrow Below, extrapolation is bad!

And...

From E. Friedman / Nuclear Physics A 925 (2014) 141–149

So

$0 \rightarrow 165$ MeV/c

165 MeV/c \rightarrow 500 MeV/c

500 MeV/c \rightarrow ...

force annihilation

fit (\bar{n}) \neq fit (\bar{p})

$\bar{n} = \bar{p}$

Antiprotons

In-flight

$$E_{\text{at rest}} = 200 \text{ MeV} < E < 10 \text{ GeV}$$

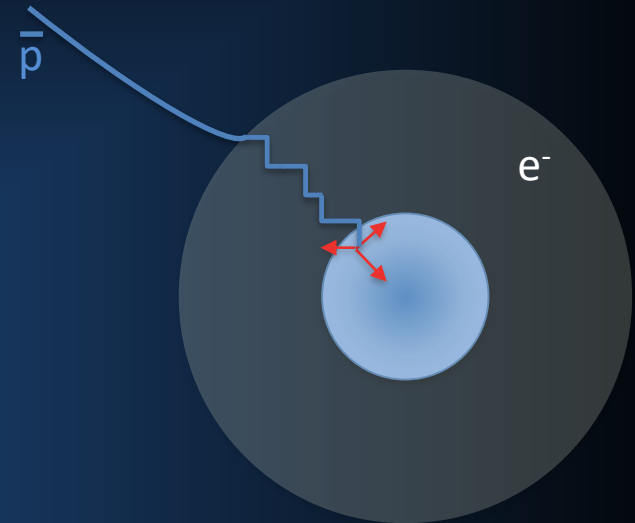

Main ingredients

- Cross sections
 - Elastic
 - Annihilation
 - Production
 - Charge exchange
- Final products (types; momenta)
- Potential (\bar{p})

At rest

$$E < E_{\text{at rest}} = 200 \text{ MeV}$$

Main ingredients

- Annihilation nucleon (p or n)
- Position of the Annihilation
(overlap: wave function(\bar{p}) x nucleon density)
- Final products (types; momenta)

Antineutrons

In-flight

$$E_{\text{at rest}} = 14 \text{ MeV} < E < 10 \text{ GeV}$$

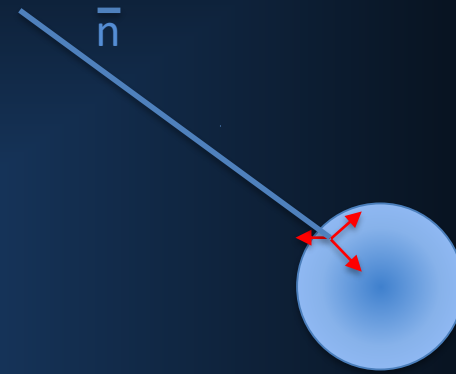

Main ingredients

- Cross sections
 - Elastic
 - Annihilation
 - Production
 - Charge exchange
- Final products (types; momenta)
- Potential (\bar{n})

« At rest »

$$E < E_{\text{at rest}} = 14 \text{ MeV}$$

Main ingredients

- Annihilation nucleon (p or n)
- Position of the Annihilation
(approximated by a gaussian)
- Final products (types; momenta)

Antineutrons

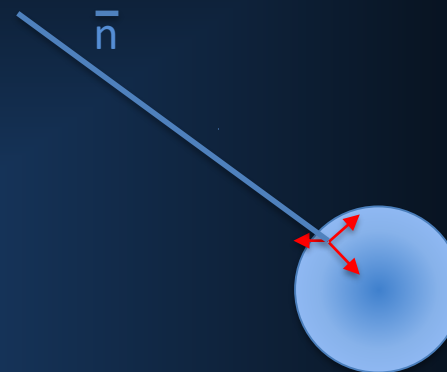

In-flight

$$E_{\text{at rest}} = 14 \text{ MeV} < E < 10 \text{ GeV}$$

« At rest »

$$E < E_{\text{at rest}} = 14 \text{ MeV}$$

Main ingredients

-
-
-

Main ingredients

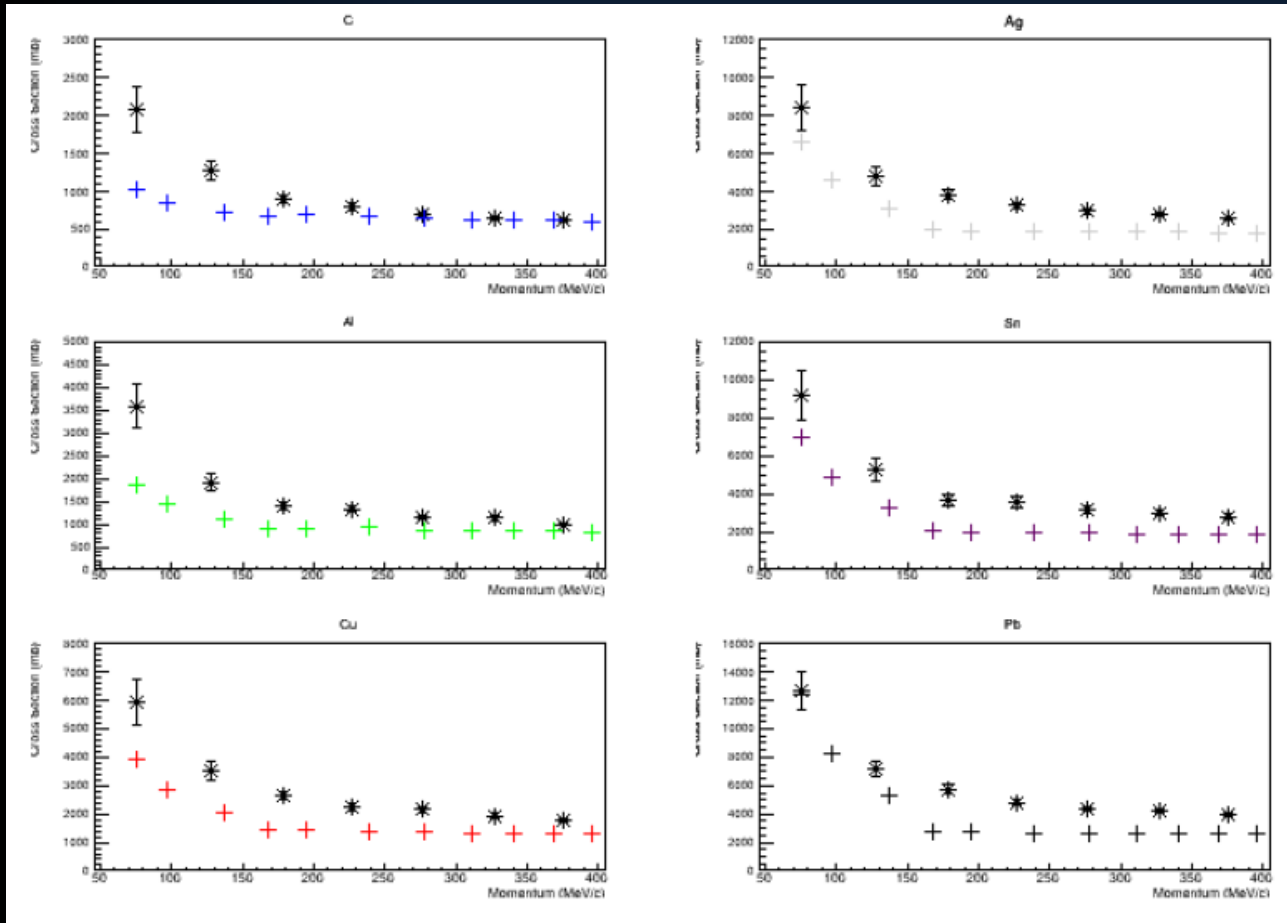

- Annihilation nucleon (p or n)
- Position of the Annihilation (approximated by a gaussian)
- Final products (types; momenta)

From E. S. Golubeva and L. A. Kondratyuk, Nucl. Phys. B56, 103 (1997).

Antineutrons Results

Annihilation σ

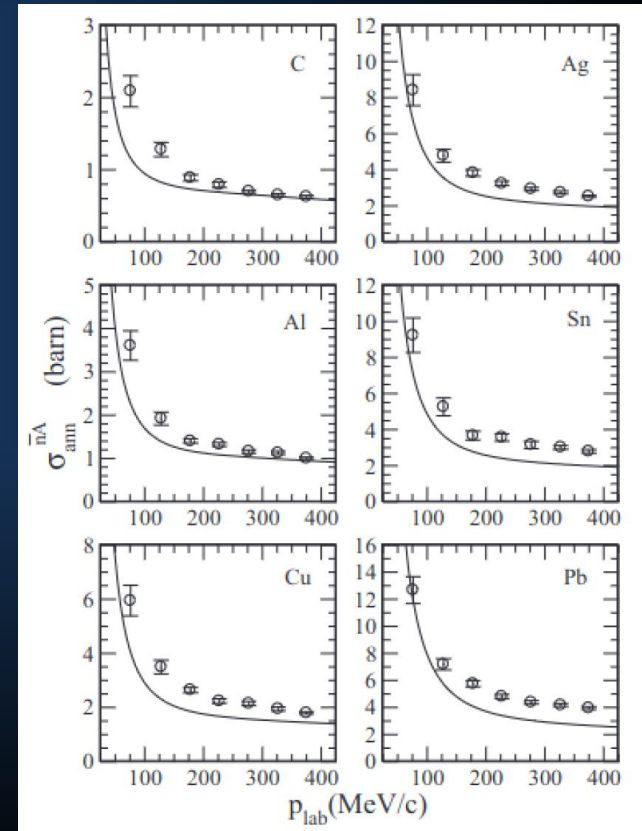

- Underestimation
- Depending on
 - the target
 - the energy
- But encouraging

Antineutrons Results

Annihilation σ

- Underestimation
- Depending on
 - the target
 - the energy
- But encouraging
- ...and similar to other model

Lee and Wong. *Phys. Rev. C* 93, p. 014616 (2016)

Antineutrons Results

Annihilation σ

- Underestimation
- Depending on
 - the target
 - the energy
- But encouraging
- ...and even better at higher energy

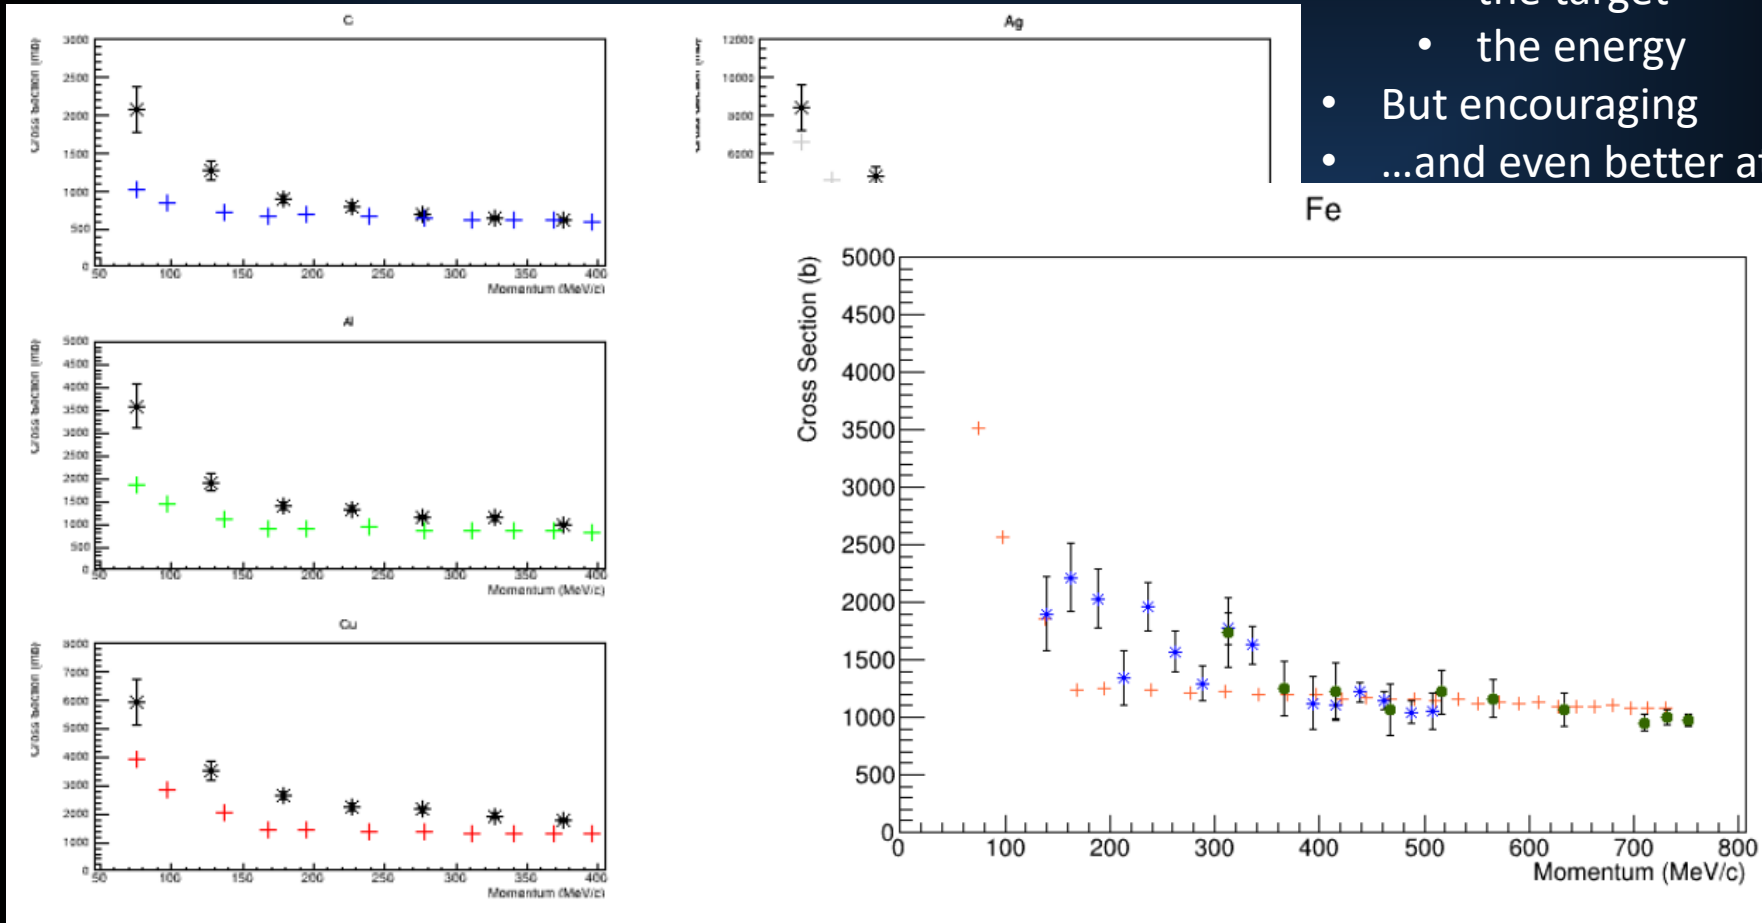

Figure 29: Sections efficaces finales du Fer. Potentiel : 50 MeV, Seuil "Au repos" : 14 MeV. Points bleus et verts : Données expérimentales de Ref. [34]. Points oranges : Données en sortie d'INCL.

Antineutrons Results

Pion multiplicity

antineutron (750 MeV)
on a target made of

	% of Target
H1	66.8 %
C12	26.6 %
F19	5 %
Br80	1.6 %
Total (INCL)	100 %
Total (Litt)	100 %

	% of Target	π^-	$\pi^+ + \pi^-$
Total (INCL)	100 %	0.98	2.73
Total (Litt)	100 %	1.23 ± 0.04	2.82 ± 0.07

- $\pi^+ + \pi^-$ OK
- π^- a little too low
- Well well well...

Antineutrons Status

- Probably not in Geant4 this year (some checks)
- Results comparable to others
- As with antiprotons, some not-so-well-known ingredients ...
(potential, position of the annihilation, on which nucleon (n? p?) the annihilation...)

$$\bar{d}, \bar{t}, \overline{{}^3\text{He}}, \overline{{}^4\text{He}}$$

- INCL treats d, t, ${}^3\text{He}$, ${}^4\text{He}$ -induced reactions (and more)
- Now \bar{n} and \bar{p} -induced reactions available
- So, why not \bar{d} , \bar{t} , $\overline{{}^3\text{He}}$, $\overline{{}^4\text{He}}$ -induced reactions?

It's in progress... but at an (very) early stage with antideuteron!

First results are encouraging.

preliminary results

\bar{d} (6.1 GeV/c per nucleon) + Ta multiplicity

	π^+/π^-	p
Exp.	5.08 ± 0.08	7.26 ± 0.16
INCL	4.98	3.43
bias	0.04%	51.7%

$$\bar{d}, \bar{t}, \overline{{}^3\text{He}}, \overline{{}^4\text{He}}$$

- INCL treats d, t, ${}^3\text{He}$, ${}^4\text{He}$ -induced reactions (and more)
- Now \bar{n} and \bar{p} -induced reactions available
- So, why not \bar{d} , \bar{t} , $\overline{{}^3\text{He}}$, $\overline{{}^4\text{He}}$ -induced reactions?

It's in progress... but at an (very) early stage.

First results are encouraging.

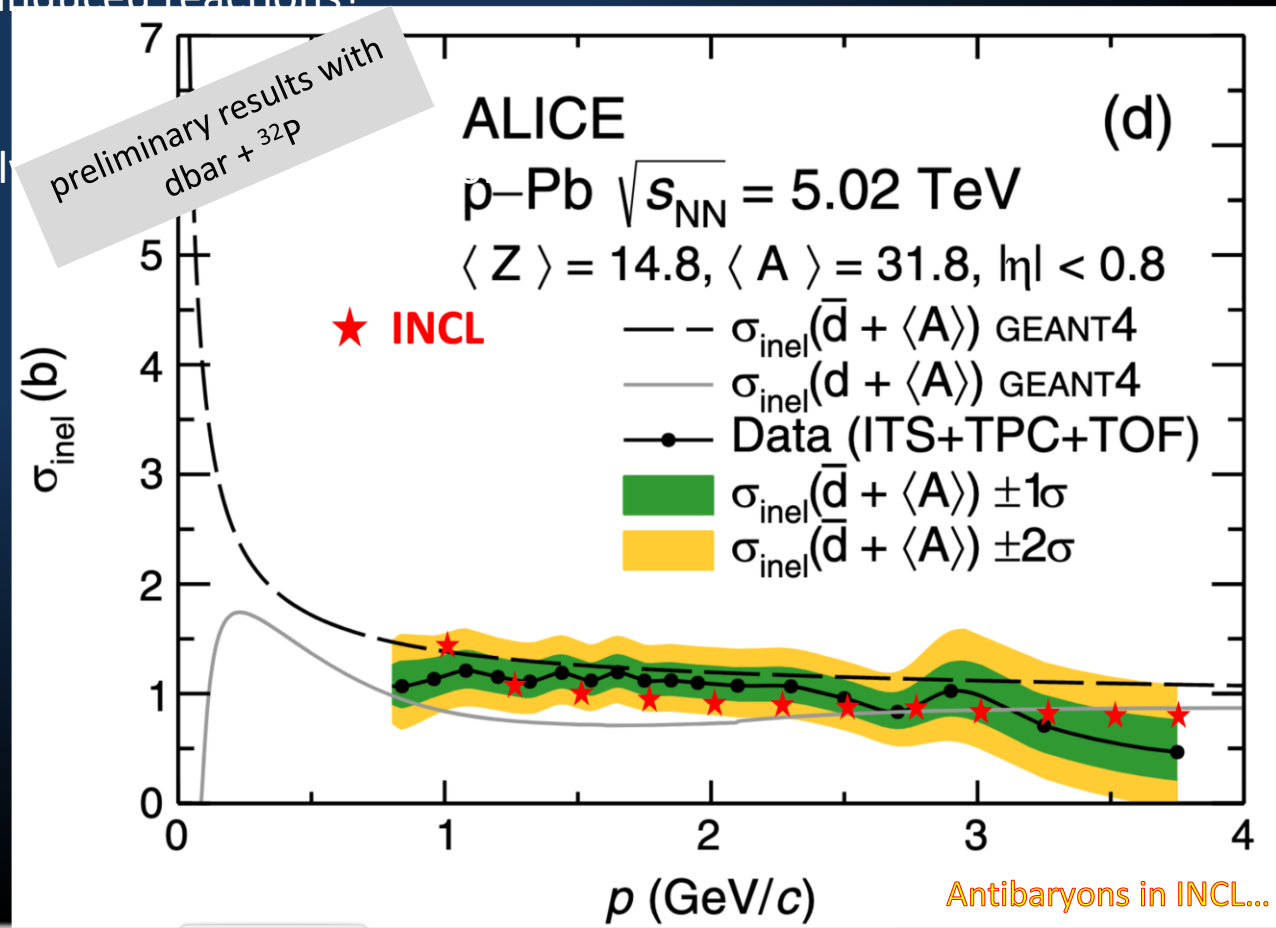

$$\bar{d}, \bar{t}, \overline{{}^3\text{He}}, \overline{{}^4\text{He}}$$

- INCL treats d, t, ${}^3\text{He}$, ${}^4\text{He}$ -induced reactions (and more)
- Now \bar{n} and \bar{p} -induced reactions available
- So, why not \bar{d} , \bar{t} , $\overline{{}^3\text{He}}$, $\overline{{}^4\text{He}}$ -induced reactions?

It's in progress... but at an (very) early stage

First results are encouraging.

Just for informations...

(linked to Geant4 on the medium and long term)

Neutrinos

In some neutrino experiments,

Energy of the neutrino is known thanks to ν -Nucleus interaction products

BUT

Increasing precision of the experiments means better/refined results in ν -Nucleus interactions

Then

Need to use models known to treat well Final State Interaction (FSI)

Reminder (several type of interactions)

QE (CCQE – NCQE)

Quasi-elastic (Charge/Neutral Current)

RES

Resonant (Δ)

DIS

Deep Inelastic Scattering (higher resonances)

Consequences for INCL

	2019	2020-2023	2024	2024	2024
Who	GENIE	A. Ershova (Thesis CEA)	Antoine L.T. Internship (CEA)	GENIE	NEUT
Link/Goal	Contact	ν -oscillation exp. INCL to treat FSI	CCQE in INCL	New contact	Contact
Work	Implementing INCL	NuWro ν -N INCL FSI	It works Some points to be understood	Implementation OK? Used within Geant4?	Implementing INCL

Uncertainties, errors

- At the 23rd Geant4 Collaboration Meeting (2018 in Lund)
A presentation on the optimization of parameter thanks to Bayesian statistics...
Also the idea to determine the bias (error) of the model
- Difficulties
Building the tools
From the stand-alone model to the use in Geant4
- Status for INCL
A project (**NuRBS: Nuclear Reaction model improvement with Bayesian Statistics**)
has been funded (2024->2027) – CEA & Bern U. (and IAEA+Coruña U.)
Goals:
 - Building tools for biasing and parameter optimisation
 - Applying them to INCL and ABLA for several cases
- Next steps propagate errors in Geant4...?

Projet-ANR-23-CE31-0008

Conclusions

- Antiprotons
 - In Geant4 (since Geant4-11.2)
 - room for improvements
 - Some not-so-well-known ingredients → Nurbs project could help
- Antineutrons
 - Not yet in Geant4 (almost ready, but some checks are necessary)
 - Improvements (see antiprotons)
- Antideuterons and heavier
 - Work has started only... (but encouraging)

Thanks for your attention!

And thanks to the students

D. Zharenov	(antiprotons + antineutrons)
O. Lourgo	(antineutrons + antideuterons)
A. Ershova	(neutrino in INCL using NuWro)
A. Legendre-Terrolle	(neutrino CCQE in INCL)

and

J. Hirtz who gave advices

This project has received funding from the *European Union's Horizon 2020 research and innovation programme* under grant agreement No 800945 — NUMERICS — H2020-MSCA-COFUND-2017

Antiprotons in INCL

Hypotheses – ingredients

At rest - Choice of nucleon to annihilate

More on proton than neutron

Group	S_p/S_n
Rome-Syracuse[Bar+64]	1.31 ± 0.03
Berkeley[CK66]	1.33 ± 0.07
Padova-Pisa[Bet+67]	1.45 ± 0.07

And, for a same experiment

$S_p/S_n(D_2)$ between 57 and 170 MeV can range between 1.113 and 1.369

$$S_p/S_n(D_2) = 1.331$$

R. Bizzarri

Il Nuovo Cimento A (1965-1970) 53.4 (Feb. 1968), pp. 956–968

We

use

$$S_p/S_n(Z, A) = S_p/S_n(D_2) \frac{Z}{A - Z}$$

- \bar{p}
Captured in a high Bohr orbit
Cascades toward the nucleus
Stops/annihilates at a given « n »
- Determination of « n »
(fits from exp. Data)
- Position of annihilation
→ When overlap of nuclear density and antiprotonic radial density

$$P_{neutronic}(r) = N_{nl} \times \rho_n \times r^2 \times |R_{n,l}|^2$$

$$|R_{n,l=n-1}| = ((2n)!)^{\frac{1}{2}} \left(\frac{2}{na}\right)^{\frac{3}{2}} \left(\frac{2r}{na}\right)^{(n-1)} \exp\left(\frac{-r}{na}\right)$$

$$N_{nl} = \frac{2}{n^2} \sqrt{\frac{(n-l-1)!}{((n+l)!)^3}} \quad (\text{a is the Bohr radius})$$

Antiprotons in INCL

Hypotheses – ingredients

At rest - Final states

- In INCL we consider only π , η , ω and K (ρ goes directly to decay products)
- Kaon frequency is put at 5%
 - 2 old values 6.82 +/- 0.25 % and 4.74 +/- 0.22 %
 - « Recent » one 5.4 +/- 1.7 %
- Final states with π , η , ω taken from
 - E.S. Golubeva et al.
Nuclear Physics A 537 (1992), 393–417.and with K from
 - Eberhard Klempt et al.
Physics Reports 413 (2005), 197–317.

Channel	Probability (%)
$\eta\eta$	0.01 (1)
$\eta\omega$	0.34 (1)
$\omega\omega$	1.57 (1)
$\pi^+\pi^-$	0.40 (1)
$\pi^0\pi^0$	0.02 (1)
$\pi^+\rho^-$	1.52 (1)
$\pi^-\rho^+$	1.52 (1)
$\pi^0\rho^0$	1.57 (1)
$\rho^-\rho^+$	3.37 (2)
$\rho^0\rho^0$	0.67 (1)
