2nd FCC Italy & France Workshop

Motivations

Measurement of **Higgs couplings** to quarks and gluons at FCC-ee

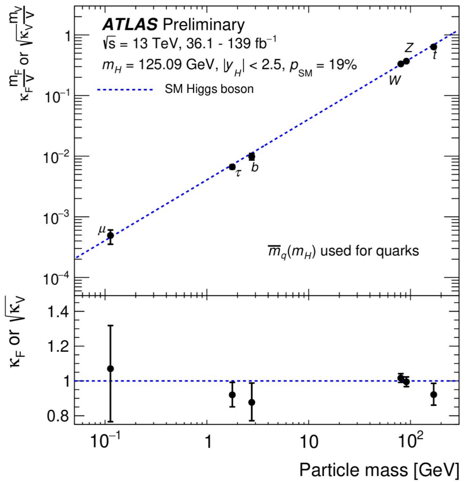
Yukawa coupling

$$m_f = v\frac{y_f}{\sqrt{2}}$$

Coupling-mass relation for fermions in the SM

Deviation from SM → Possible BSM physics

2022 (LHC)



~2040 (HL-LHC)

Coupling	HL-LHC
κ_W [%]	1.5*
κ_Z [%]	1.3*
κ_g [%]	2*
κ_γ [%]	1.6*
$\kappa_{Z\gamma}$ [%]	10*
κ_c [%]	–
κ_t [%]	3.2*
κ_b [%]	2.5*
κ_μ [%]	4.4*
κ_τ [%]	1.6*
BR_{inv} (<%, 95% CL)	1.9*
BR_{unt} (<%, 95% CL)	4*

Fully hadronic represents 80% of the Higgs decays

Higgs decay	**H→bb**	**H→WW/ZZ**	**H→gg**	**H→cc**	**H→ss**	**(H→ττ)**
BR	57.7%	11%	8.6%	2.9%	0.024%	(6.2%)

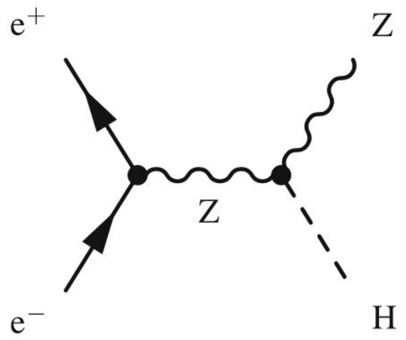
only one observed to this day (H→bb)

Observable at FCC-ee

Also possible future observation of **Flavour-violating** decays

Overview

ZH (Higgstrahlung)



Z decay channels

$Z \to ll$, $l = e,\mu$
$Z \to qq$
$Z \to \nu\nu$

√S & Luminosities (full program)

240 GeV → 10.8ab-1
365 GeV → 3.0ab-1

Samples IDEA (Delphes fast sim)

signals ZH - H→bb/cc/gg/ss/WW/ZZ/ττ
N = 2 exclusive kT clustering for Z(ll/$\nu\nu$)**, N = 4 for Z(qq)

backgrounds WW, ZZ, Z/γ*, Zqq, ee, μμ, tt, $\nu\nu$Z, qqH

- **Orthogonal selection** to separate all **Z decay** channels (ll, qq, $\nu\nu$)
- S/B optimization with **cuts** on H dijets and Z decay pairs
  - cuts on E_{jets}, E_{miss}, $p_{leptons}$, $|\cos(\theta_{ll/qq})|$, $m_{ll/qq}$, ...
- **Categorization** of events in relation to their tagged Higgs decay *(b,c,g,s,W,Z,τ)*
  - categorization using Jet Tagger scores + jet properties
- **Simultaneous fit** on all categories assuming tagging efficiencies

** We also force reconstruction of H(WW/ZZ) to be 2 jets (rather than the expected 4)

Outline

Analysis I

ZH ⟶ **ll**jj/$\nu\nu$jj at **240** & **365** GeV (APC)

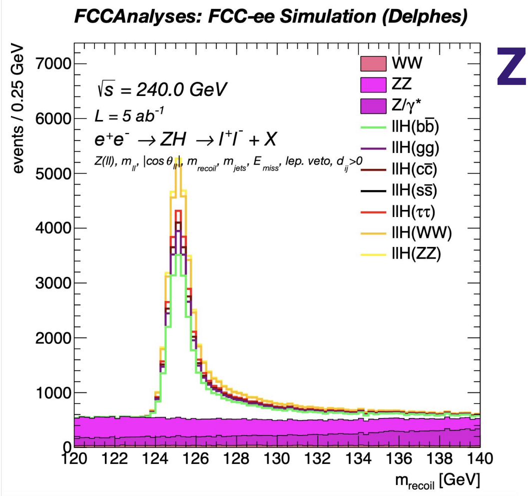
jj = bb,cc,gg,ss,WW,ZZ,ττ

Analysis II

ZH ⟶ **qq**jj/$\nu\nu$jj at **240** & **365** GeV (BNL)

Combination of the studies

ZH⟶lljj/$\nu\nu$jj at 240 GeV



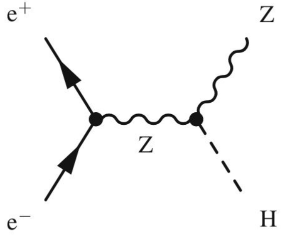
Z(ll)

Signals: Z(ll)H(bb/cc/gg/ss/WW/ZZ/ττ)

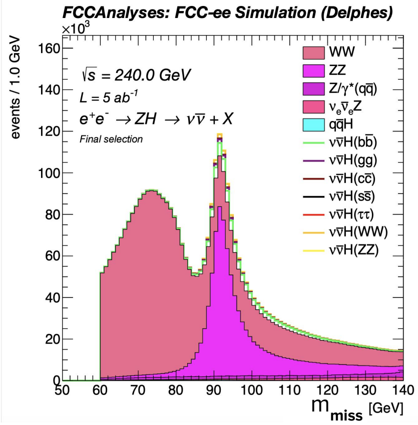
Backgrounds: WW, ZZ, Z/γ*, Zqq, ee, mumu

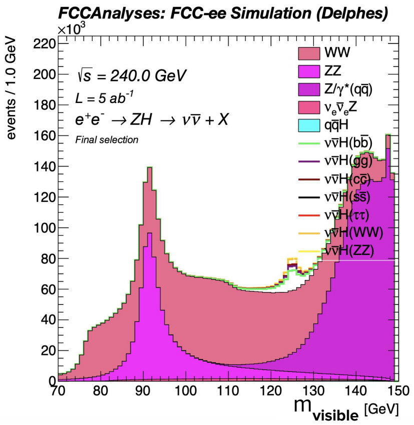
1D Study of the mass recoiling from the **Z**

$$(E_{ll} + E_H, \overrightarrow{p_{ll}} + \overrightarrow{p_H}) = (\sqrt{s}, \vec{0}) \Rightarrow M^2_{recoil} = s + m_Z^2 - 2E_{ll}\sqrt{s}$$



Z($\nu\nu$)





Signals: Z($\nu\nu$)H(bb/cc/gg/ss/WW/ZZ/ττ)

Backgrounds: WW, ZZ, $\nu\nu$Z, Zqq, qqH

2D Study of the mass recoiling from the **H** + visible mass from **H decay**

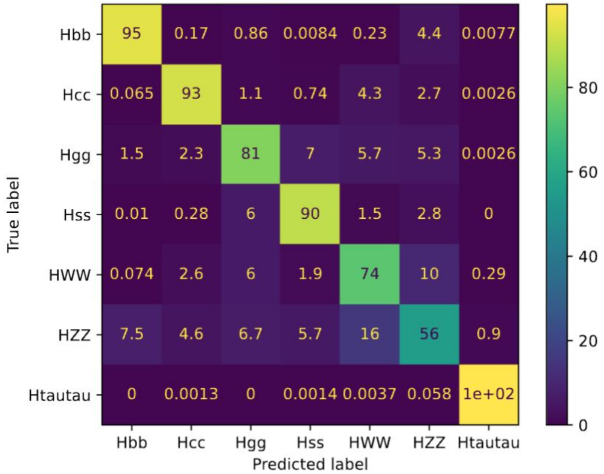
$m_{miss} (= m_{\nu\nu}) = m_{recoil}$

$m_{visible} = m_{jj}$

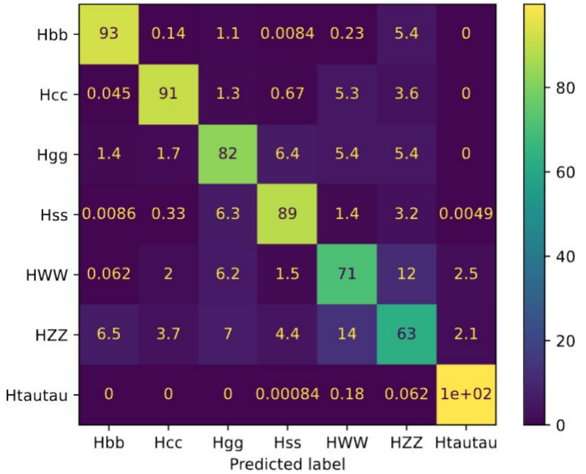
Events categorization - 240 GeV

We train a Neural Network to categorize the events in each signal channels

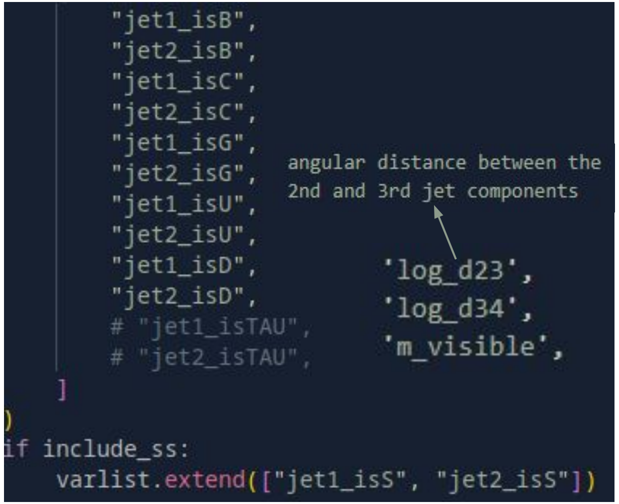
Z($\nu\nu$) Confusion Matrix



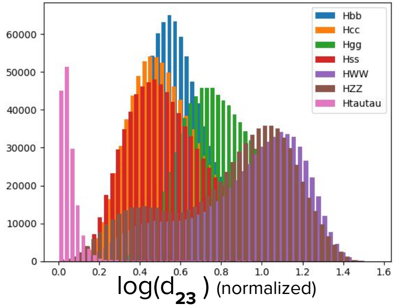
Z(ll) Confusion Matrix

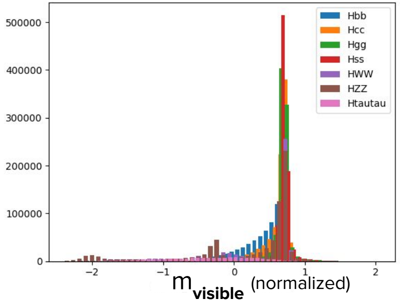


Training variables



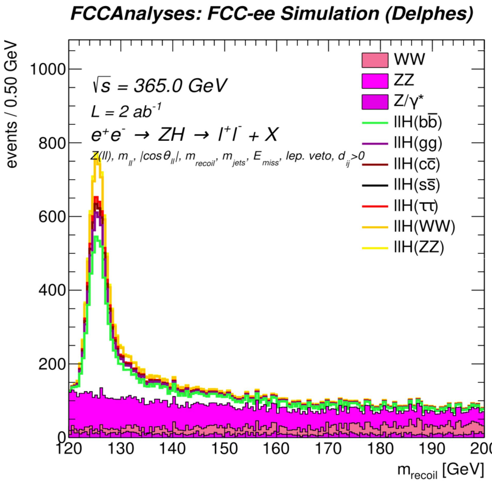
Training variables consist of output scores of a ParticleNet jet tagger which runs after reconstruction + some additional kinematic variables improving sensitivity in some channels





ZH⟶lljj/$\nu\nu$jj at 365 GeV

changes compared to 240 GeV



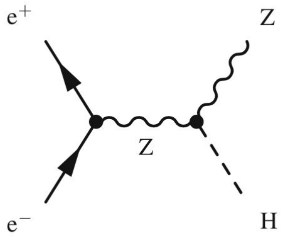
Z(ll)

Signals: Z(ll)H(bb/cc/gg/ss/WW/ZZ/$\tau\tau$)

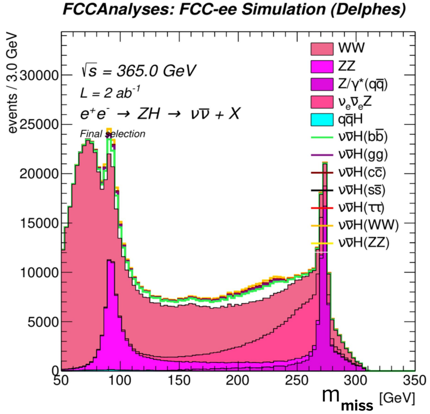
Backgrounds: WW, ZZ, Z/γ*, ~~Zqq~~, ee, mumu, tt

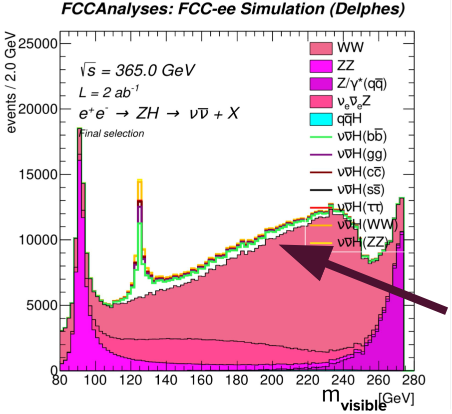
1D Study of the mass recoiling from the **Z**

$$(E_{ll} + E_H, \overrightarrow{p_{ll}} + \overrightarrow{p_H}) = (\sqrt{s}, \vec{0}) \Rightarrow M^2_{recoil} = s + m^2_Z - 2E_{ll}\sqrt{s}$$



Z($\nu\nu$)





Signals: Z($\nu\nu$)H(bb/cc/gg/ss/WW/ZZ/$\tau\tau$)

Backgrounds: WW, ZZ, $\nu\nu$Z, Zqq, qqH, tt

2D Study of the mass recoiling from the **H** + visible mass from **H decay**

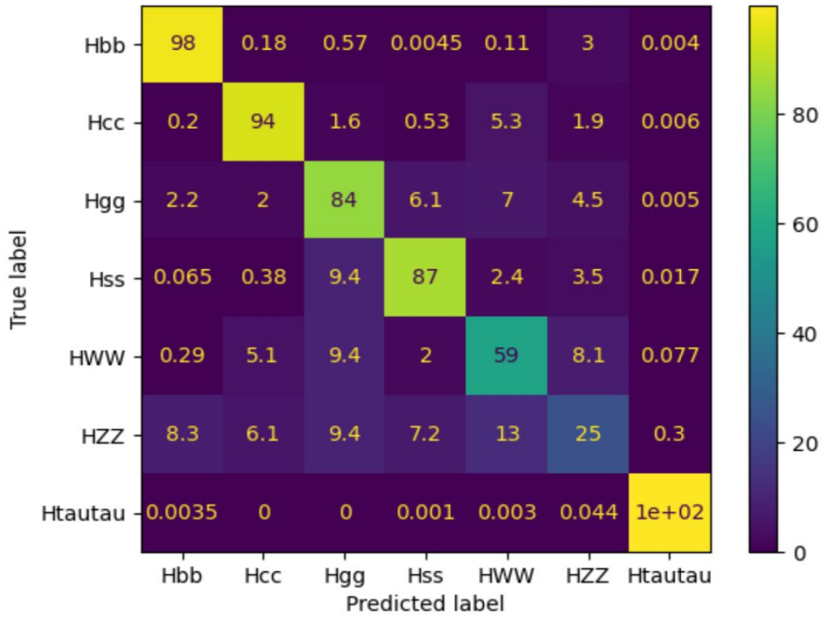
Contribution from **VBF** non-negligible at 365 GeV

$m_{miss} (= m_{\nu\nu}) = m_{recoil}$ $\quad$ $m_{visible} = m_{jj}$

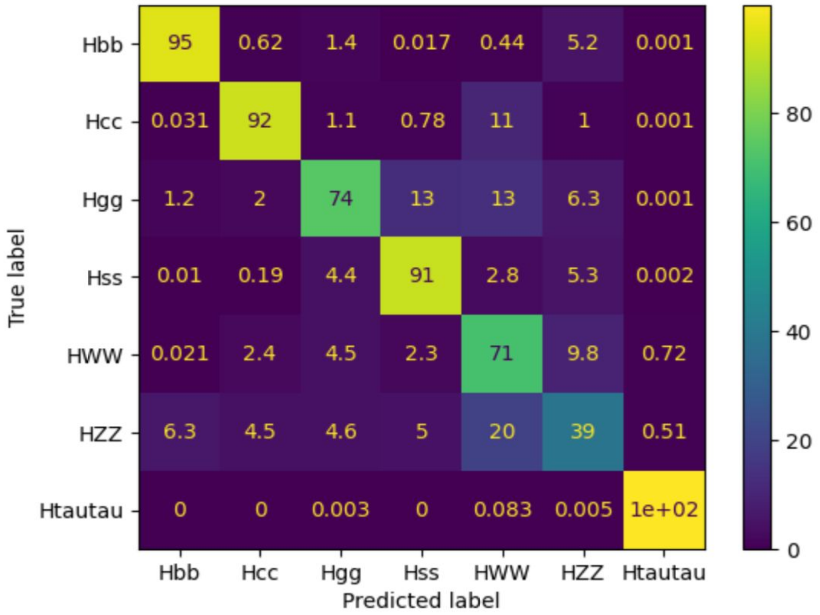
Categorization - 365 GeV

Same training variables and strategy as for 240GeV

Z($\nu\nu$) Confusion Matrix

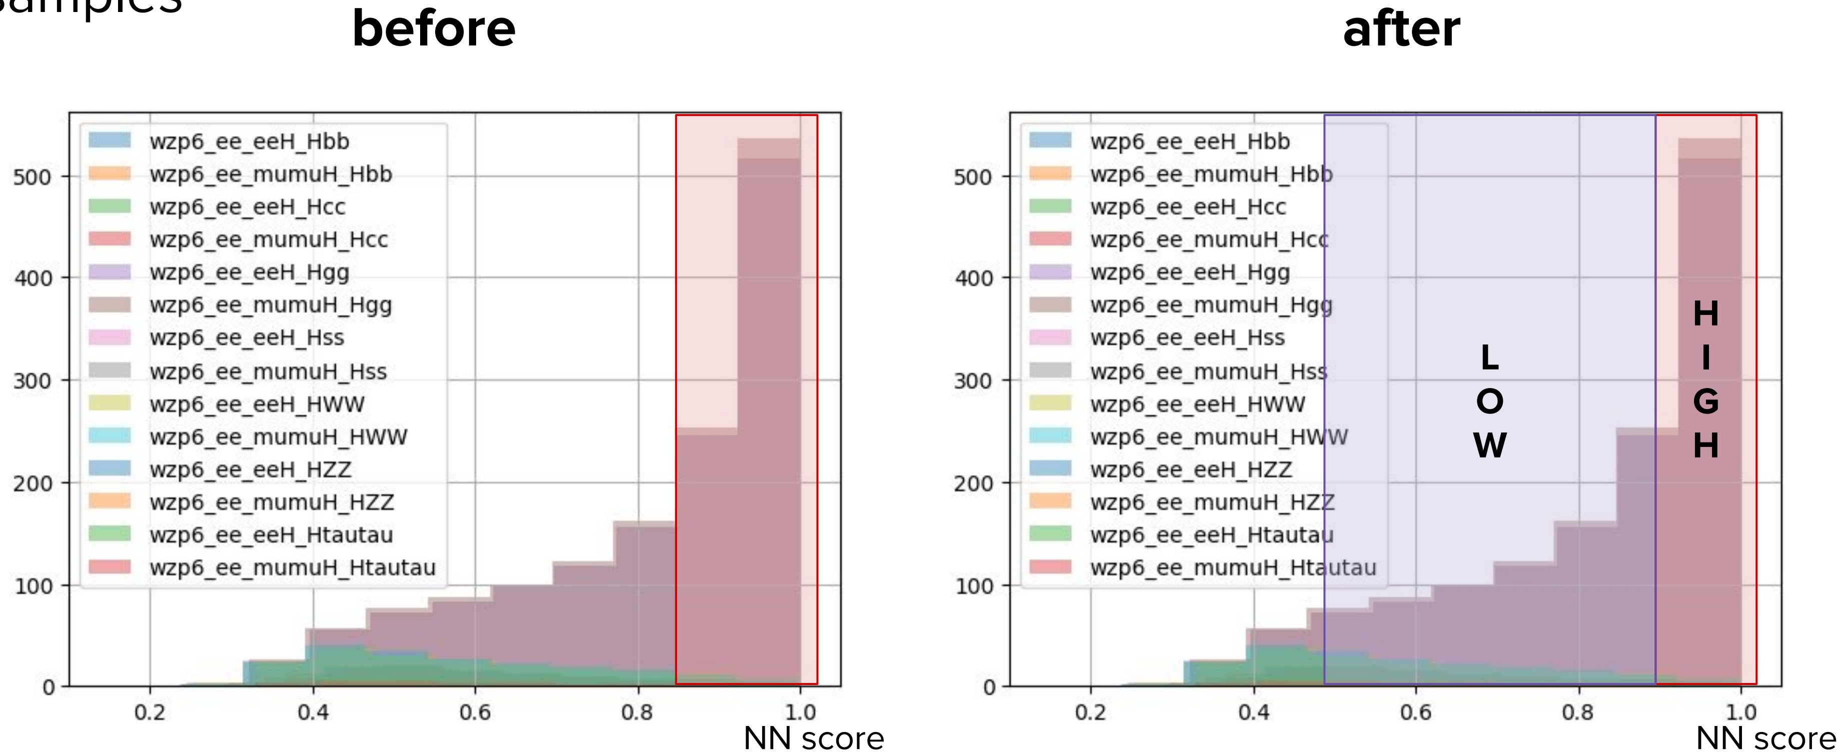


Z(ll) Confusion Matrix



Purity categorization - 240 & 365 GeV

Goal : increase analysis sensitivity by including purity categories in the samples



We considered a maximum of **3 purity categories (high, mid, low)**

ZH⟶$\nu\nu$jj at 240 & 365 GeV (BNL)

Signals: Z($\nu\nu$)H(bb/cc/gg/ss/WW/ZZ/ττ)

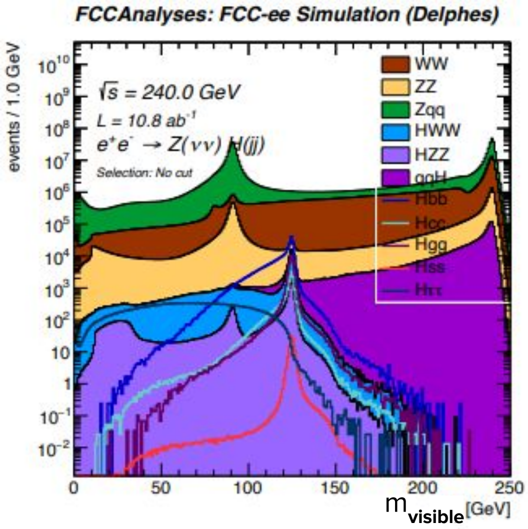
Backgrounds: WW, ZZ, Z/γ*, Zqq, $\nu\nu$Z

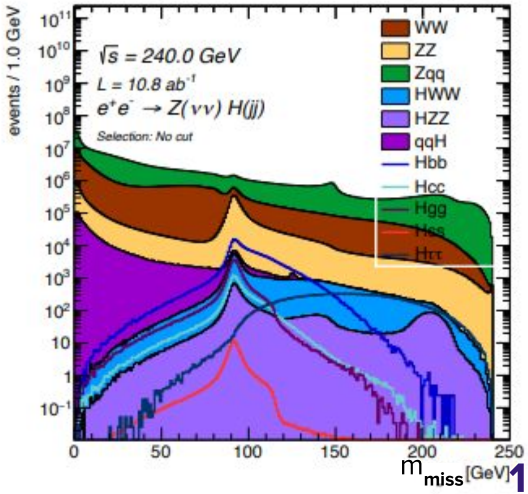
2D Study of the mass recoiling from the **H** + visible mass from **H decay**

$m_{miss}(= m_{\nu\nu}) = m_{recoil}$ $m_{visible} = m_{jj}$

Categorization of jets using the same ParticleNet jet tagger scores as previous analysis (different method)

Events selection orthogonal to Zll analysis





ZH⟶qqjj at 240 & 365 GeV

Signals: Z(qq)H(bb/cc/gg/ss/WW/ZZ/ττ)

Backgrounds: WW, ZZ, Z/γ*, Zqq, $\nu\nu$Z

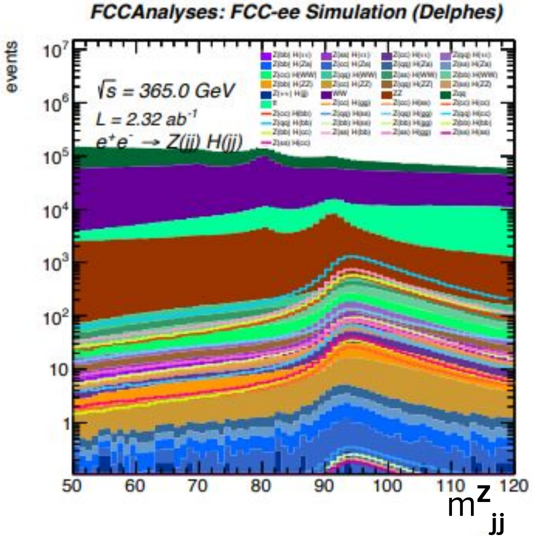
2D Study of the both hadronic masses from the **H** and **Z**

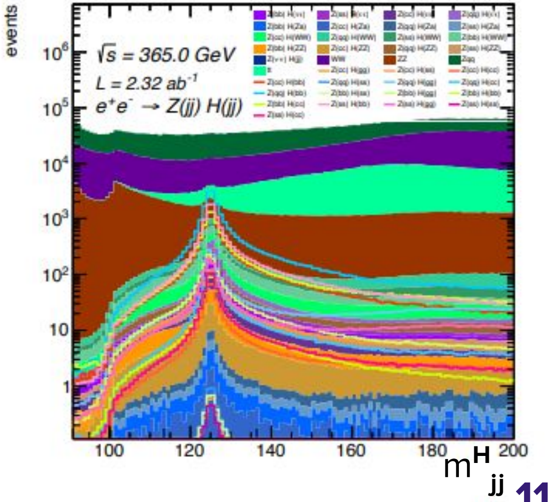
$m_H = m^H_{jj}$ $m_Z = m^Z_{jj}$

Categorization of jets using the same ParticleNet jet tagger scores as previous analysis (different method)

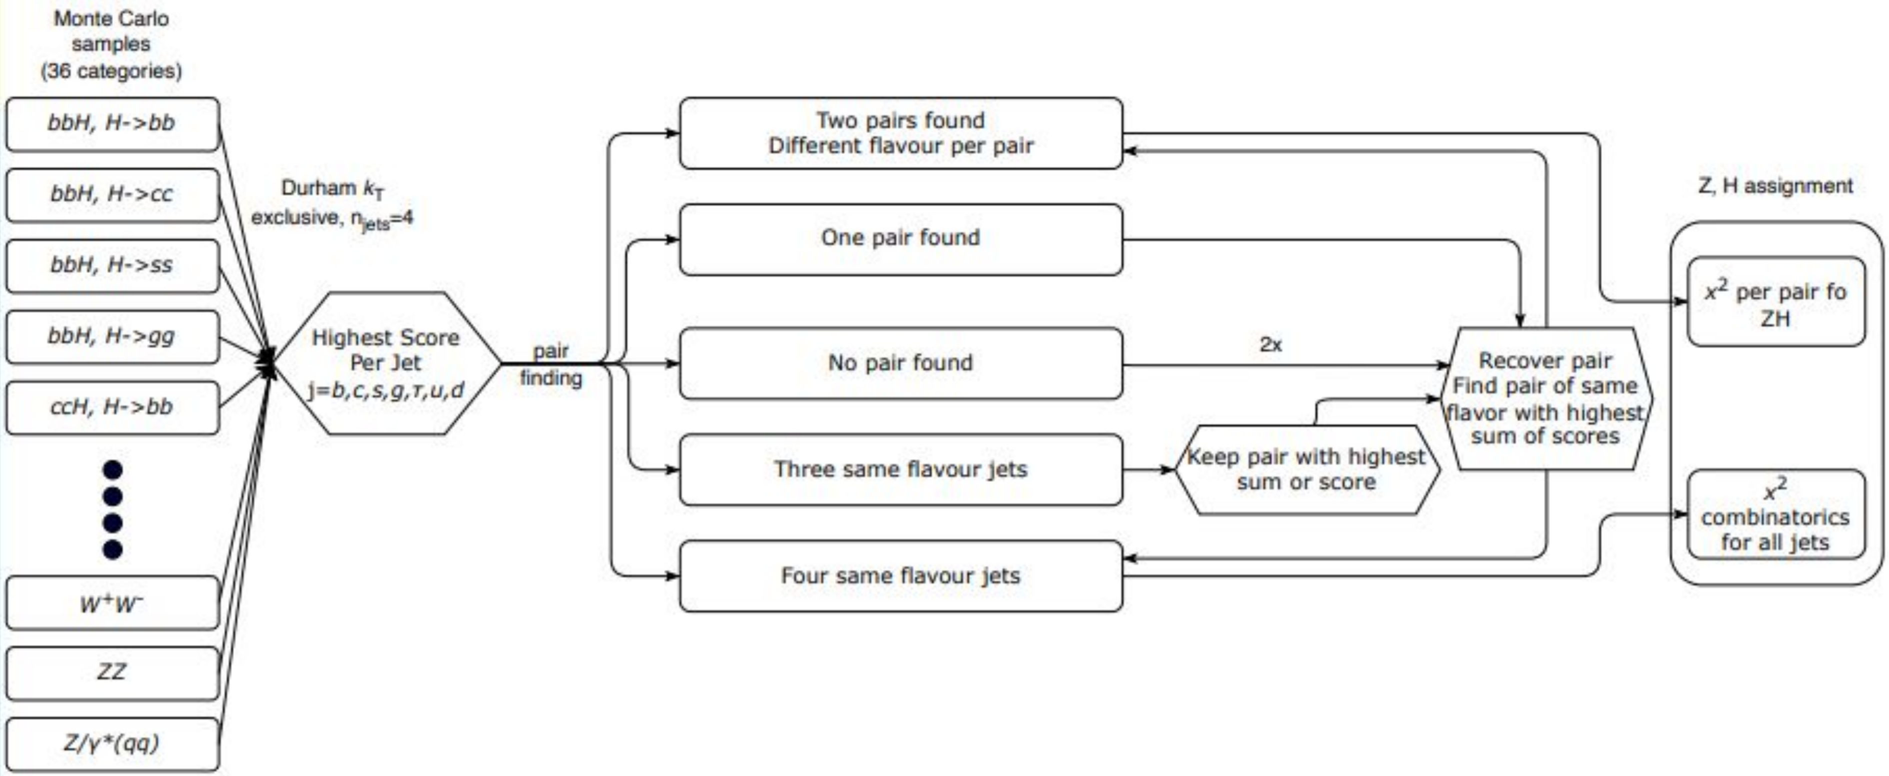
Events selection orthogonal to Z(ll)/Z($\nu\nu$) analysis

Jet Pairing based on tagger scores & combinatorics





Jet pairs reconstruction for Z(qq)H(jj)



Categorization for Z(qq) and Z($\nu\nu$) - Score Map

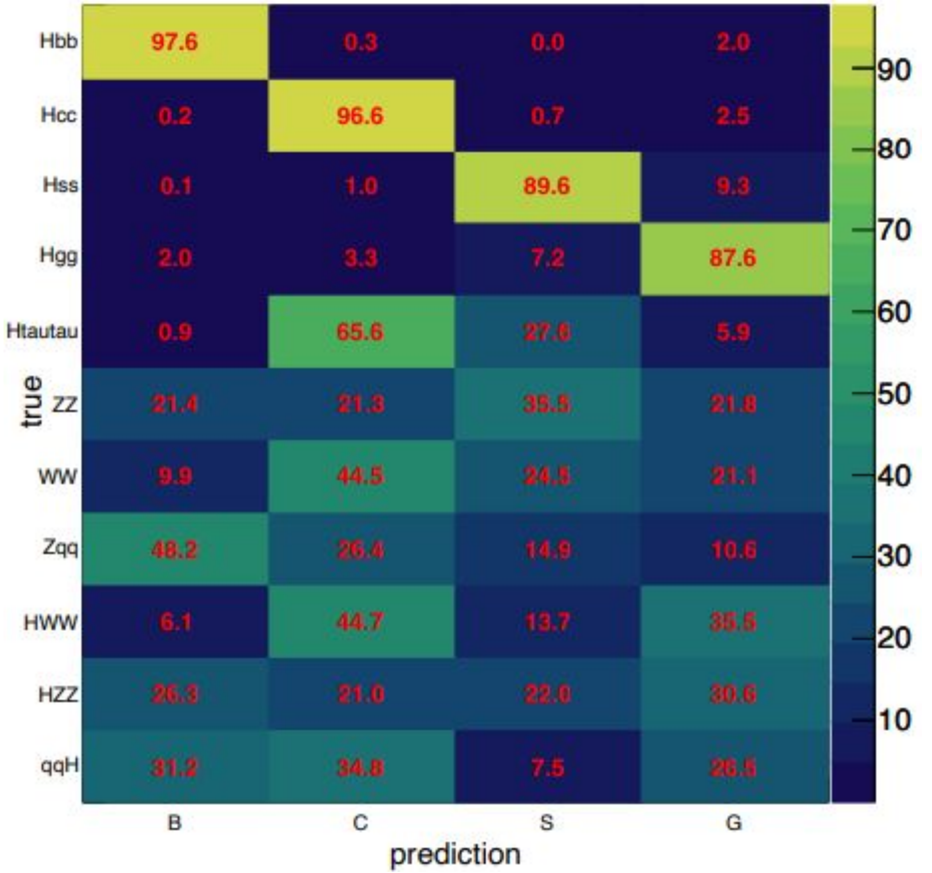
Events are categorised from the sum of the two jets score

$$\forall \text{ event: } J_{12}^{score} = J_1^{score} + J_2^{score}, J = b, c, s, g$$

$$\text{eg. if: } J_1^{score} = b \ \& \ J_2^{score} = b \implies B_{like}^{score}$$

$$\text{if } B_{like}^{score} > C_{like}^{score} > S_{like}^{score} G_{like}^{score} \implies B_{like}^{event}$$

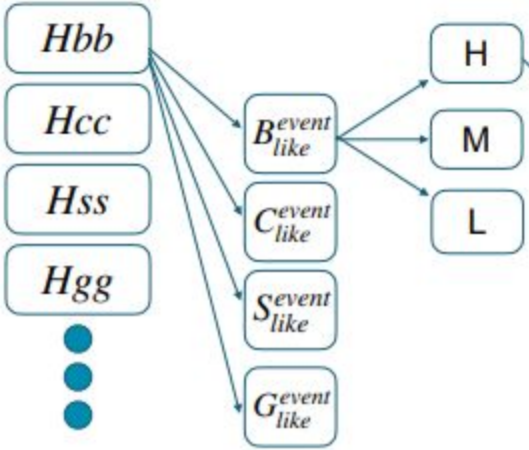
Events are further divided in 3 categories based on their *Score Like* value

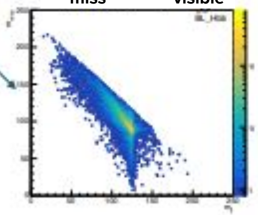


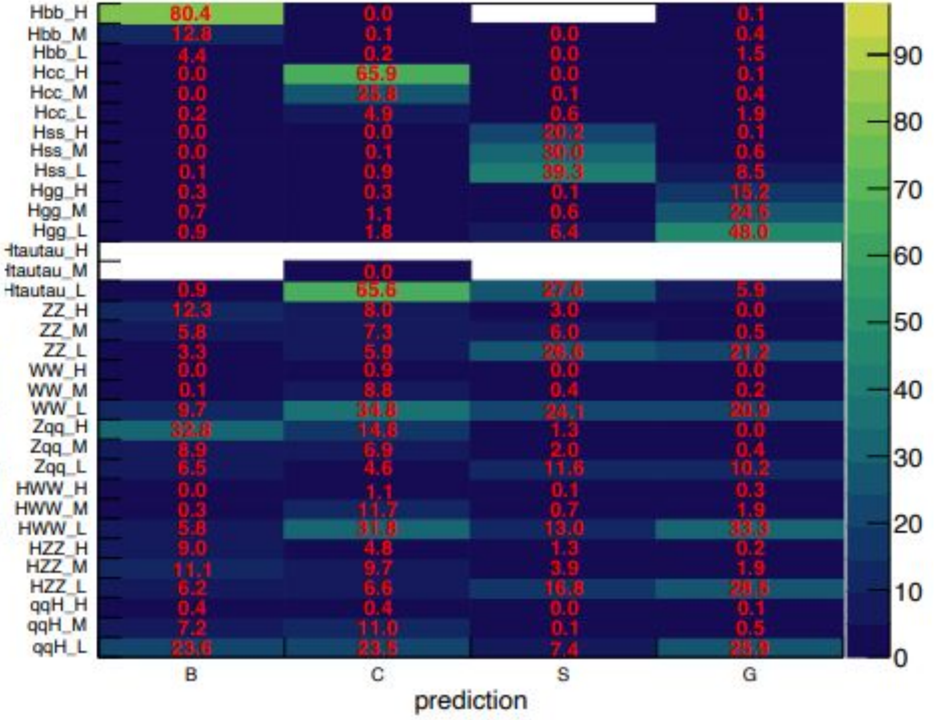
Categorization for Z(qq) and Z($\nu\nu$) - Purity categories

- Split the J_{like}^{score} in three bins of purity: Low, Medium, High

	B	C	S	G
L	< 1.1	< 1.0	< 1.1	< 1.2
M	$\in [1.1, 1.9]$	$\in [1.0, 1.8]$	$\in [1.1, 1.7]$	$\in [1.2, 1.5]$
H	> 1.9	> 1.8	> 1.7	> 1.5







Results - Combination at 240 GeV

Fitting using **CMS** tool **CombineTF** to extract σ.BR in each category

Monte Carlo stats uncertainties

No systematics on the backgrounds

Expected sensitivity (%) of σ(ZH).BR(H⟶jj) at 68% CL   L = 10.8ab-1

240 GeV	H⟶bb	H⟶cc	H⟶gg	H⟶ss	H⟶ZZ	H⟶WW	H⟶ττ

Conclusion & prospects

Promising results at **% level** in some categories

Achieved full combination at **240 GeV**. Combination at **365 GeV** is **WIP**

Need to **disentangle VBF** from **ZH** and extract couplings from the fit **(WIP)**

Include **Flavour-Violating** and **uu/dd** Higgs decay channels

Submitted results to **ECFA** paper and **France Strategy** symposium

Expected sensitivity (%) of σ(ZH).BR(H⟶jj) at 68% CL **L = 10.8ab-1**

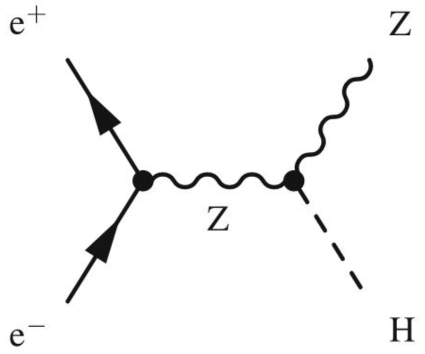
240 GeV	H⟶bb	H⟶cc	H⟶gg	H⟶ss	H⟶ZZ	H⟶WW	H⟶ττ
Combined (BNL)	0.21	1.66	0.8	104.99	10.07	1.16	3.97
Combined (APC)	0.22	1.65	0.93	121	9.56	1.11	3.79

Thank you

Big thanks to : George Iakovidis
and Giovanni Marchiori, Jan Eysermans and Michele Selvaggi

(ZH) Higgstrahlung process - Recoil Mass

- $e^+ + e^- \rightarrow Z + H$



Recoil Mass :

$$(E_{ll} + E_H, \overrightarrow{p_{ll}} + \overrightarrow{p_H}) = (\sqrt{s}, \vec{0}) \Rightarrow M^2_{recoil} = s + m_Z^2 - 2E_{ll}\sqrt{s}$$

- Allows model independent measurement of the total Higgs Cross-section
- Unusable in the LHC due to the composite nature of protons

Cutflows - 240 GeV

S/B optimized with **selections** on leptons and jets kinematic properties

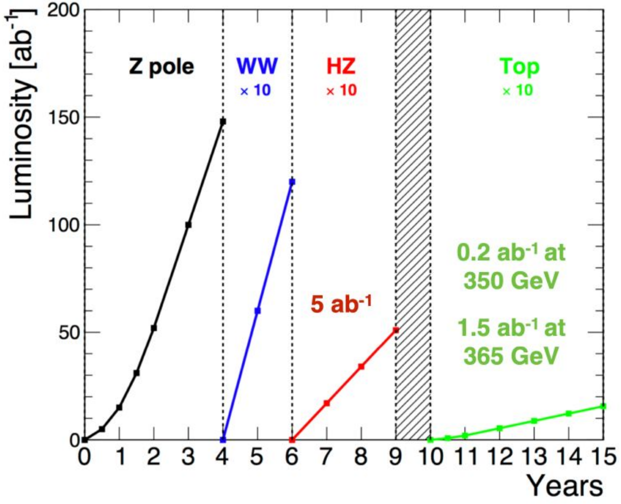
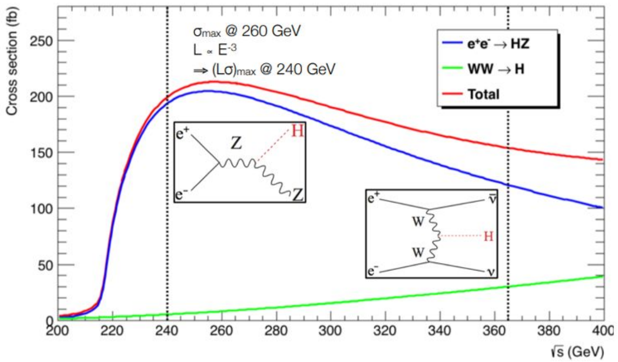
The FCC experiment - FCC-ee

FCC-ee functioning schedule





- **FCC** (Future Circular Collider)
  - ~90km circular collider project
  - Two periods on functioning : **FCC-ee** & FCC-hh

  - Great improvement on EW studies wrt **LEP**
  - Higgs factory

  - Great prospects for new physics (hh)

Fitting strategy for all channels

Fitting using **CMS** tool **CombineTF** to extract σ.BR in each category

7 POIs, Hbb, Hcc, Hss, Hgg, Hττ, HWW, HZZ (floating parameters)

Binning :

- **BNL :** 1 GeV bin width (projected in 5 GeV for the recoil mass)
- **APC :** custom binning *by-eye* (negligible/little improvement compared to 1 GeV width)

Empty categories removed from the fit

Rebinned such that :

- There is at least one **expected** (sum of sig+bkg) event in each bin
- Add 10-6 events in empty bins to help fit convergence, without implementing a bias

Monte Carlo stats uncertainties

- No systematics on the backgrounds
