Logging and Traceability

who, what, when,
where, how
... why?

David Crooks

UKRI STFC

EGI CSIRT/IRIS Security team

david.crooks@stfc.ac.uk

Introduction

- Logging basics
- Central logging
- Data Protection
- Network logging

Why do we log?

- To know what happened **in as much detail as necessary**
- Often, security concerns are an extension of operations
 - **What** happened?
 - **When** did it happen?
 - **Where** did it happen?

 - **How** did it happen?
 - **Why** did it happen?

Examples

- Why did this data transfer fail?
- Why did this job only complete partially?
- Which endpoints were involved in this process?
- What did the attacker do?

Day to day life

- Logs are an integral part of our technical lives
- This ubiquity comes careful consideration

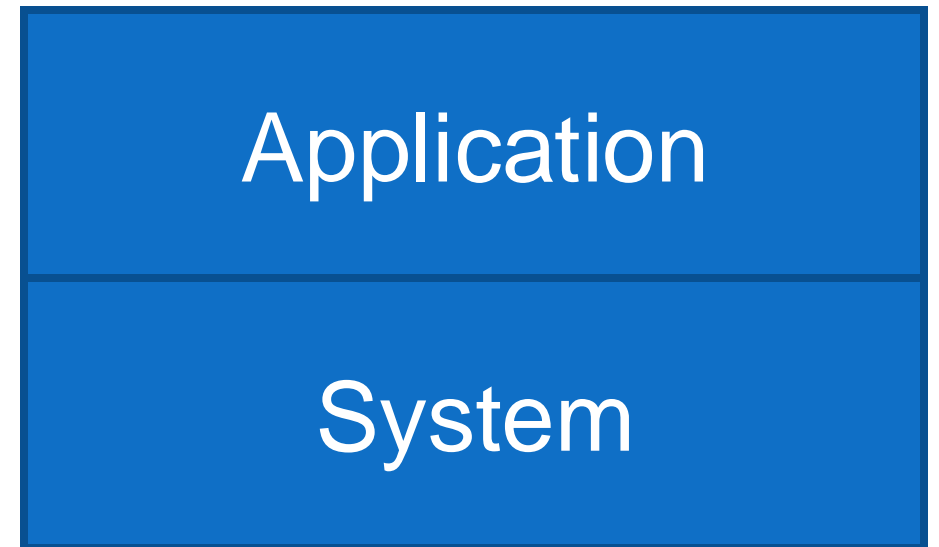

Host/service logs

- Application logs
- System logs

Host/service logs

- Application logs
 - Apache
 - Drupal
 - Ceph
 - Dcache
 - ...

Host/service logs

- Application logs
- These depend on the service
- Talk about this again in traceability, but: service owners are best placed to understand what is useful!

Host/service logs

- System logs
- Give us an understanding of the behaviour of the system itself
 - Direct access via `ssh`
 - System behaviour
 - Auditing over time
- (Paths will be for RHEL Distros)

Host/service logs

- System logs

- /var/log/audit.log

```
type=USER_AUTH msg=audit(1655751006.984:3758): pid=26347 uid=0 auid=4294967295 ses=4294967295

```

Application

OS

Host/service logs

- System logs
 - `/var/log/audit.log`
- `aureport` can be used to get summary information

Host/service logs

- System logs
 - `/var/log/audit.log`

```
Summary Report
=====
Range of time in logs: 01/01/70 01:00:00.000 - 21/06/22 07:46:12.034
Selected time for report: 01/01/70 01:00:00 - 21/06/22 07:46:12.034
Number of changes in configuration: 0
Number of changes to accounts, groups, or roles: 0
Number of logins: 3
Number of failed logins: 0
Number of authentications: 9
Number of failed authentications: 0
Number of users: 2
Number of terminals: 5
Number of host names: 4
Number of executables: 4
Number of commands: 2
Number of files: 0
Number of AVC's: 0
Number of MAC events: 0
Number of failed syscalls: 0
Number of anomaly events: 0
Number of responses to anomaly events: 0
Number of crypto events: 35
Number of integrity events: 0
Number of virt events: 0
Number of keys: 0
Number of process IDs: 21777
Number of events: 164767
```

Application

OS

Host/service logs

- System logs
 - Auditbeat
- Part of the elasticsearch Beats set of tools that can also extract and effectively parse audit data

Host/service logs

- System logs
 - `/var/log/messages`

Records global log messages, system notifications including those during boot

Host/service logs

- System logs
 - `/var/log/secure`

Records successes and failures for users using `ssh` to access the system

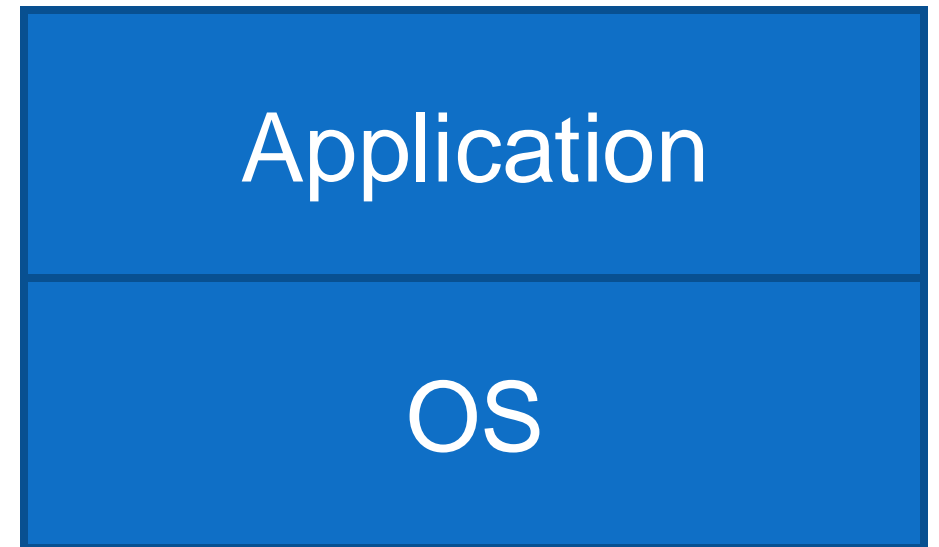

Host/service logs

- System logs

- `/var/log/secure`

```
Jun 19 22:18:36 hostname  
sshd[26877]: Accepted  
publickey for user from  
A.B.C.D port 60096 ssh2: RSA  
SHA256:...
```

Success!

Host/service logs

- System logs
 - `/var/log/secure`

```
Jun 20 19:08:58 hostname  
sshd[7555]: Invalid user admin  
from A.B.C.D port 36844
```

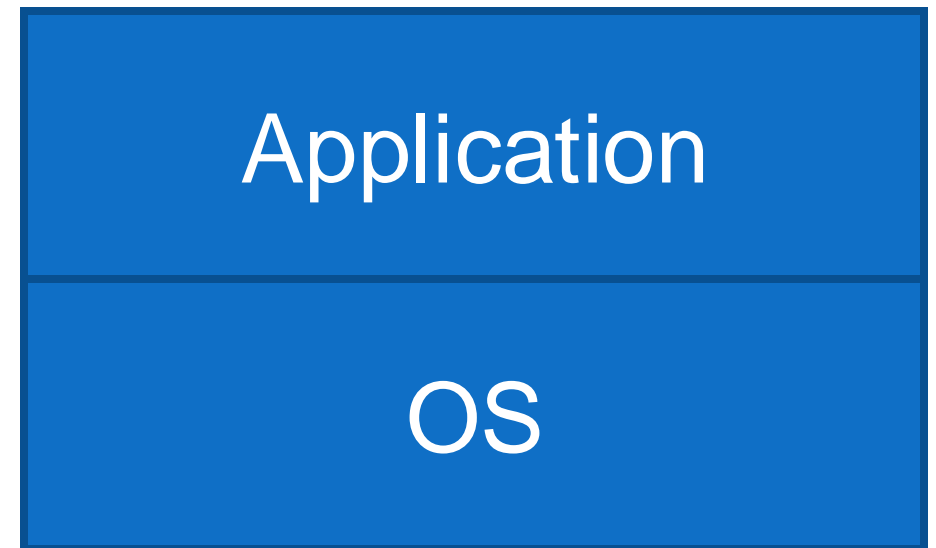

Application

OS

Host/service logs

- System logs
 - `/var/log/secure`

```
Jun 20 19:08:58 hostname  
sshd[7555]: Invalid user admin  
from A.B.C.D port 36844
```

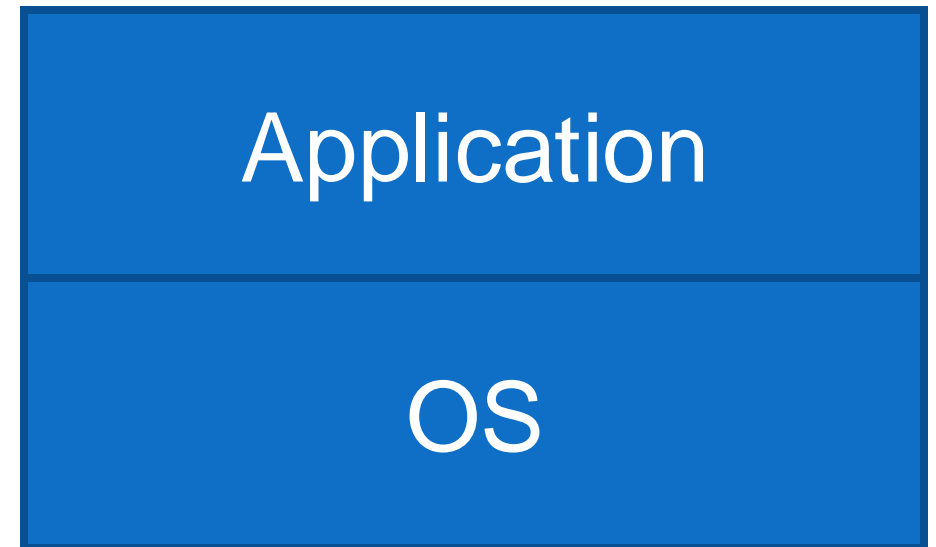

Host/service logs

- System logs
 - `/var/log/secure`

... this is why you harden your systems (although only a *real* problem if they succeed)

A primary source of checking for malicious access

Unless?

A successful attacker

- Gains access via a weak password (`password2023-2`)
- Installs a compiler, builds some code...
- ... hides their tracks by truncating the logs

Central logging

- Logs are data
- Vulnerable to deletion or corruption
- Back them up!

Central logging

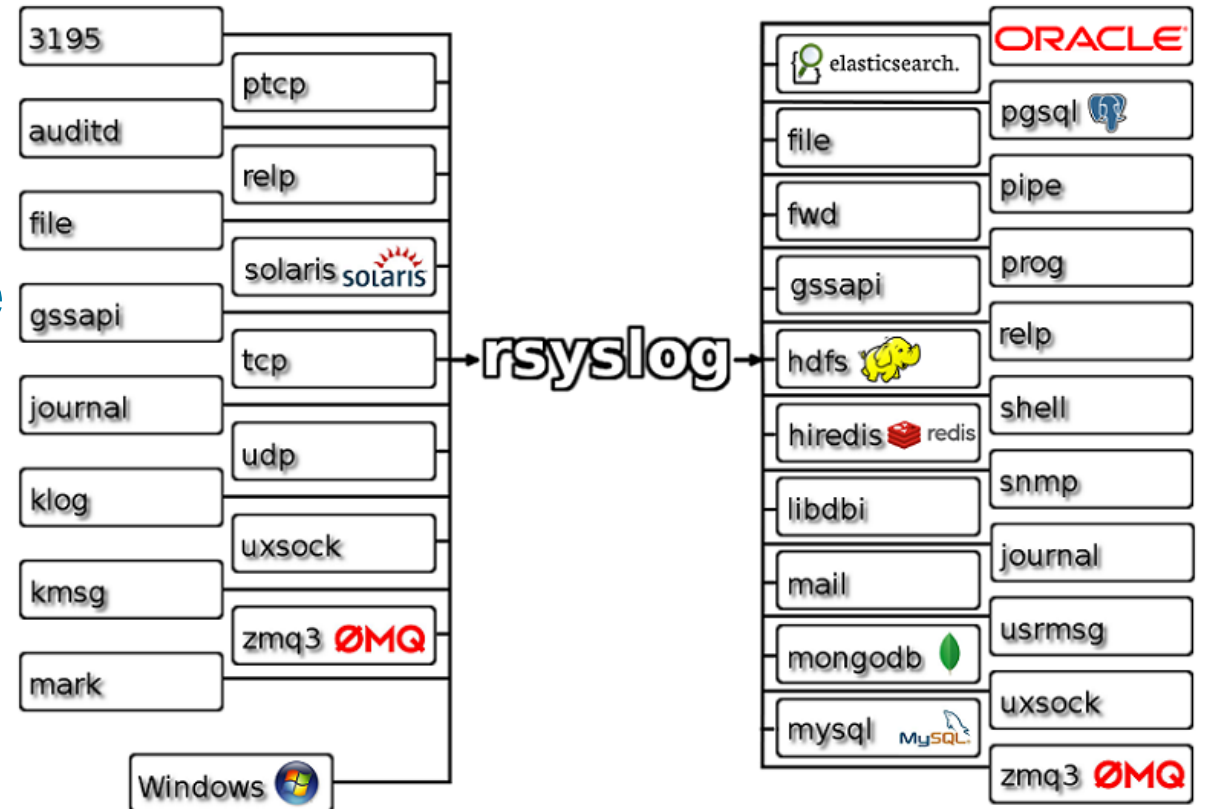

Central logging

- **One of the single most important things to do for the security of a service**
- Helps incident response
- Helps correlate logs between hosts
- Manually searching logs is time consuming and may be less effective
- Tools to aggregate and visualise logs are therefore important

rsyslog

- `rsyslog` is a well-featured logging engine
- `rsyslog` and `syslog-ng` are both feature-rich successors to the original `syslog`

<https://www.rsyslog.com>

rsyslog and other tools

- Especially at this point, storing raw logs is not the most useful
- Use a tool like elasticsearch to allow better searching and querying of the data

OSSEC/Wazuh

- OSSEC is a very nice host-based IDS that will aggregate logs in a server/client topology
- Customisable rules
- Very flexible

<https://www.ossec.net>

OSSEC/Wazuh

- Wazuh is a modern development of OSSEC that integrates tightly with elasticsearch
- Important when considering defence in depth – having one exactly one tool to monitor your system is **not** optimal (necessary 😊)

The logo for Wazuh, featuring the word "wazuh" in a bold, lowercase, sans-serif font. A small blue dot is positioned at the end of the word, serving as a period. The logo is set against a light gray rectangular background.

wazuh.

<https://wazuh.com/>

Wazuh/OSQuery

- Wazuh can monitor many useful things at the host level
 - File integrity + checksums
 - Configuration Assessment
 - Extended Detection and Response
- OSQuery is a nice tool that provides an SQL interface to system information

wazuh.

<https://wazuh.com/>

 **osquery**

<https://osquery.io>

System + application logs

- Discussed some key system logs
- Application logs are best understood by their service owners: how to choose what you need?

System + application logs

- We can't store an infinite amount of logs

- And we don't want to

“too much data looks like noise”

Data protection

- I am not a lawyer 😊

Data protection

- We are in an era where individual privacy rights are rightly taken particularly seriously
- This is not something that should hinder our security work

- GDPR

- CERN OC11

- Development of UK data protection laws

- Working with laws in other countries

GDPR and CSIRT activities

- In GDPR and associated findings the exchange of logs for incident response is recognized as a useful activity
- https://www.first.org/blog/20171211_GDPR_for_CSIRTs
- We **do** need to be careful about what we store, why, and for how long

Access controls

- A necessary consideration for logging is that – as we've just discussed – the information could be sensitive
- Tracking who can access logs and how is therefore very important
 - Security services are just as in need of hardening as any other

Log retention

- In LHC computing context, for a long time 90 days was the retention period set by policy
- Now moving towards 180 days or more: why?

Log retention

- The number of incidents that have their beginning many months ago
- Only having logs for 90 or 180 days means we lose visibility
- 12 – or 13 – months is where we might set our sights

Log retention: practical matters

- Of course, there are practical matters
 - Logs take up room
- Central logging **also** makes capacity planning easier
 - Build to a set of services that are logged
- Continuous improvement is important

Log retention: practical matters

- Our architecture will suggest where and how many logs we can keep
- This can and should evolve over time
- Focus on sustainable development

Traceability

- For security, we want the logs that will help us piece together a set of events
 - When did someone gain access?
 - What did they do on the host?
 - Where did they go next?
 - What other hosts did they talk to?

Traceability

- Traceability is the ability for us to trace the activity associated with a particular user and/or particular workflow
- Want to be able to track the entire lifecycle
 - Initiation
 - Primary events
 - (External) communications
 - Closeout

Traceability

- Core system logs are essential; for application logs we want anything that helps piece these together
- Debug logs don't help with this
- It is likely that this will **also** evolve over time
- Make a plan and iterate based on your risks and resources

Split traceability

- Our the, current circumstances, it is **highly likely** that the logs from a particular service – or even facility – will not be sufficient to track the activity of a user or group
- Why?

Split traceability

- In research and education, invariably work as part of a bigger infrastructure, federation or federation of federations

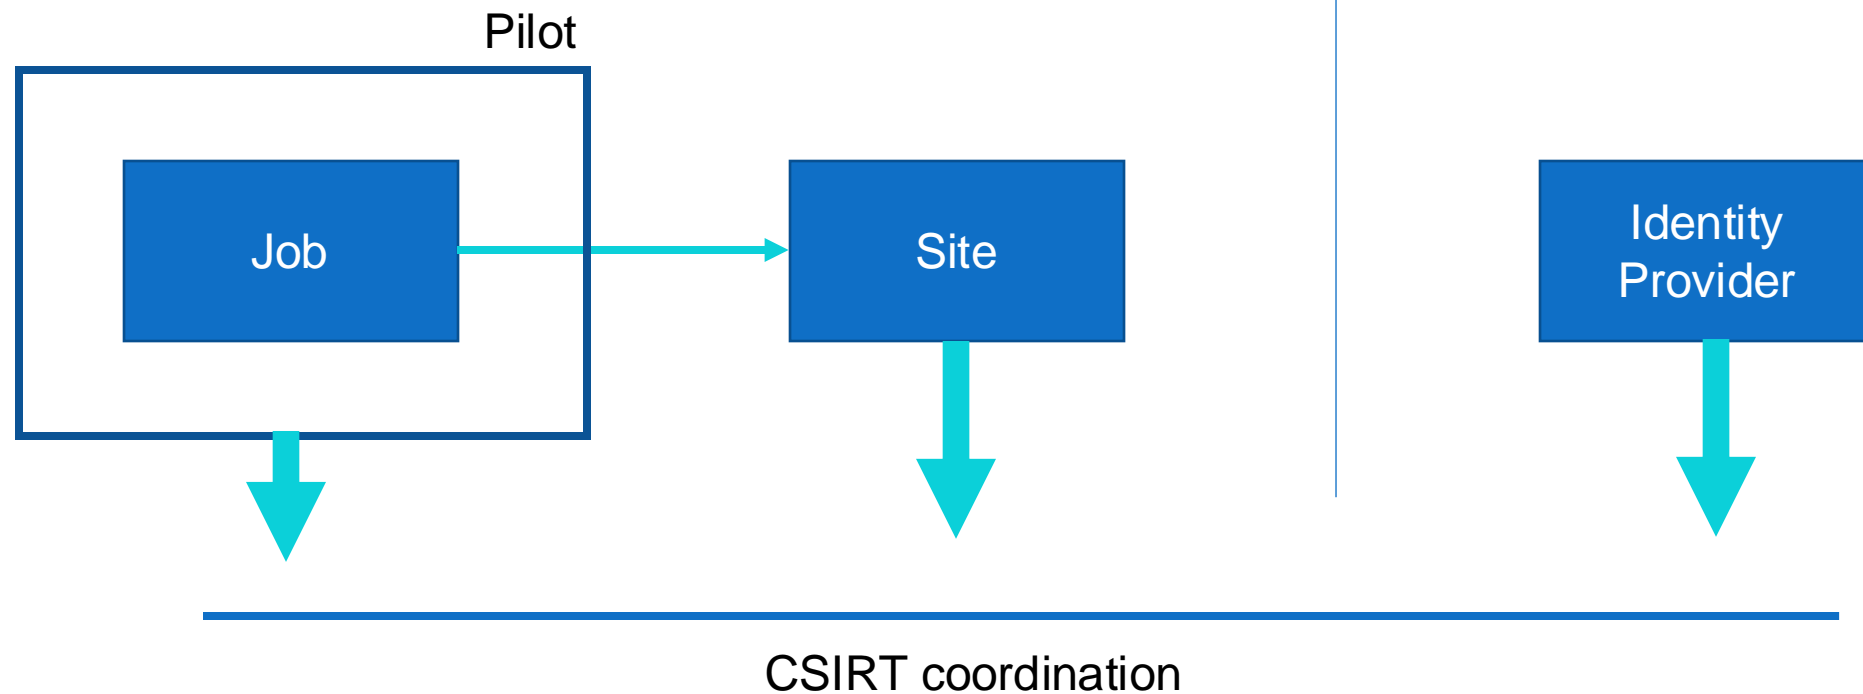

Split traceability

- Many (most!) of our activities involve many services composed together
 - WLCG pilot jobs
 - **Cloud services**
- We can **no longer** rely on the logs on a single host/in a single facility to assemble the full picture of a user's activity

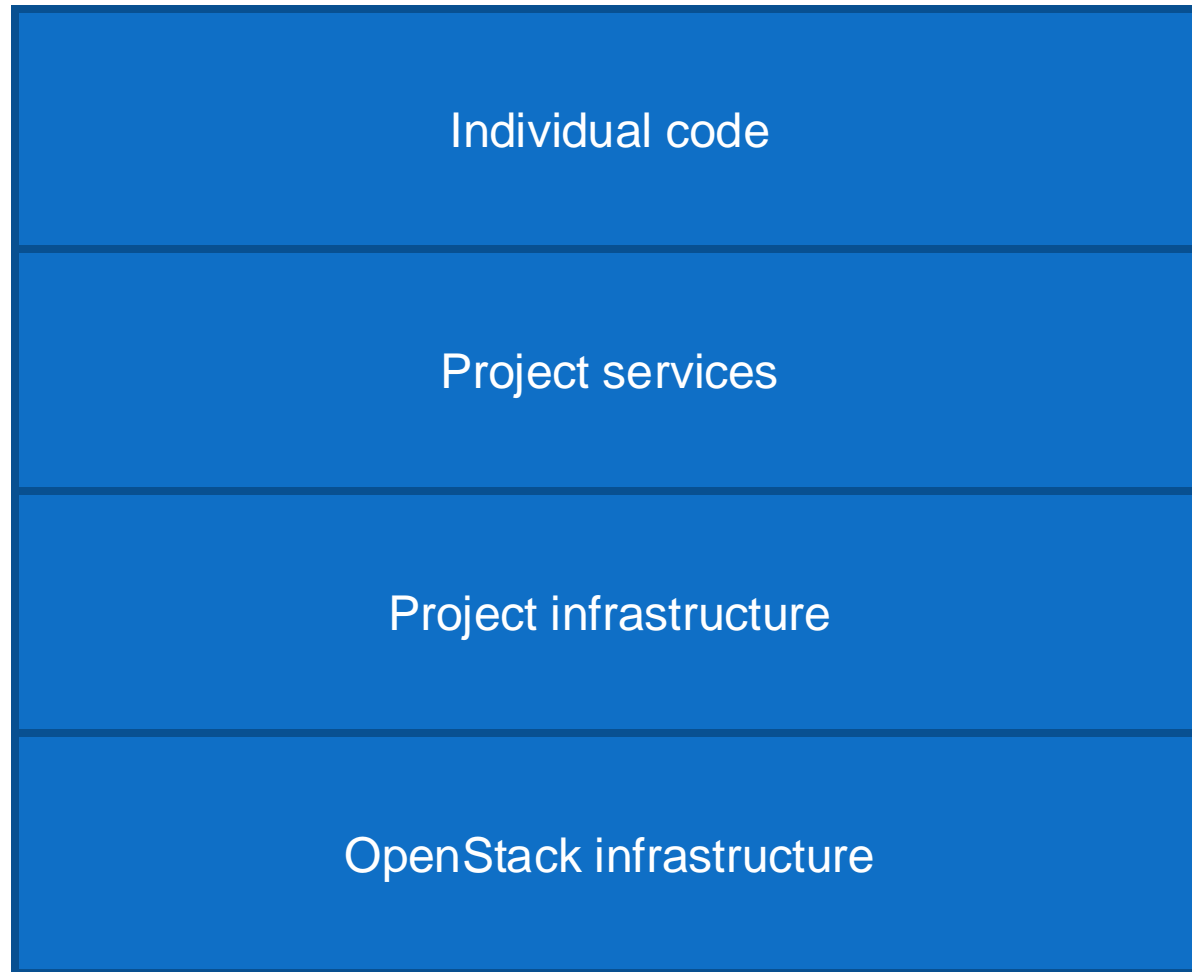

LHC case study: grid jobs: historical

LHC case study: pilot jobs: after

Cloud services

How do we evaluate our traceability?

- Planning and policy
- Collaboration and cooperation
- **Testing**
- Find use cases that are appropriate for you and try them out!

Network logging

- We've talked about host based logs
- What's happening on the network?

Sources of network logs

- Routers
- Host-based generators
- Monitoring

Netflow and sflow

- Netflow and sflow are different but similar methods of storing **metadata** about network connections
 - Endpoints/duration/...
- Most switches we'll use will generate one or the other
- Can generate on-host
 - `hsflowd`

Netflow came from Cisco

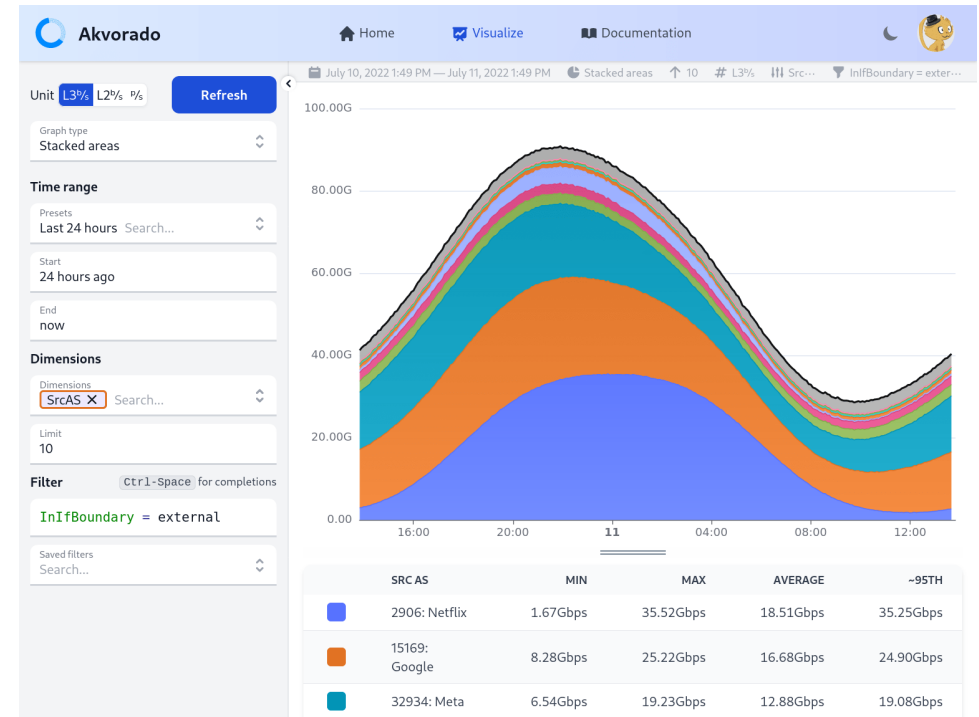

sflow came from InMon

Netflow and sflow

- Pros
 - Ubiquitous
 - Easy to generate
- Cons
 - Sampled
- In general, have **sampled** data from netflow and sflow
- Useful for long term connections but **not forensically useful**

Flow collectors

- Example: [Akvorado](#)
- flow collector, enricher and visualizer
- Clickhouse backend
 - Fast and effective

Netflow and sflow

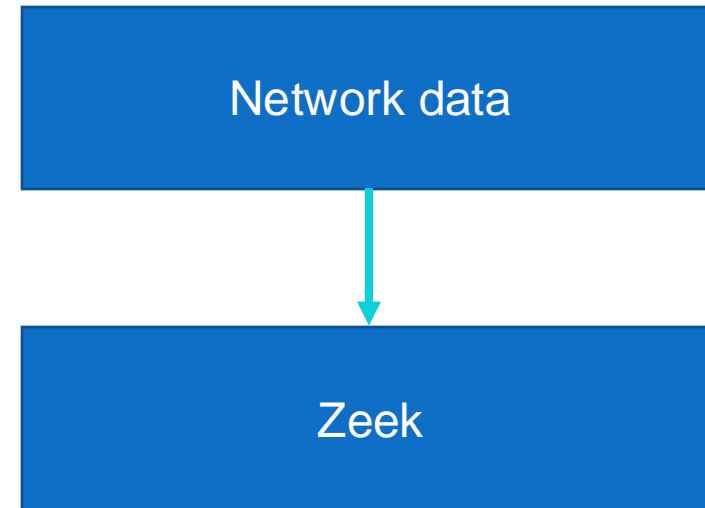

- Netflows are especially useful at a high level
 - NRENS
- You **can** produce 1:1 data, but...

Deep Packet Inspection

- Using a tool that analyses every packet it sees will yield rich information
 - Metadata
 - File information
 - Certificate information...
- Can't see inside encrypted streams unless you do decryption

Zeek

- Zeek is an example of a current network IDS in broad use in the US and EU
 - Ingest data by taking tap of network traffic
 - Optical, port spanning or packet broker
- Single threaded, works by running a set of scripts against each packet
 - Scale out by building a zeek batch farm

Zeek

- This gives us forensic level results
 - Every packet is tracked
- But this is computationally expensive
 - Need care in choosing deployment
- More on this soon

Conclusions

- We need to retain logs that describe the activity of our users and services
 - For long enough to perform forensics
 - Following our legislation
 - Pragmatically for our environment

Conclusions

- We can identify logs in our services that will help with this
 - System
 - Application
- We can centrally log these
 - And **should!**

Conclusions

- We need to consider traceability in being able to piece together the events related to a particular user or activity
- This is **very likely** to require composition with other sources including other sites

Conclusions

- In addition to host-based logs, we can also log traffic from our networks
- {Net,s}flow generally give sampled, high-level metadata
- Deep packet inspection gives us greater, forensic detail
 - But more computationally intensive

Questions?
