IN COLLABORATION WITH:

KRZYSZTOF REDLICH, CHIHIRO SASAKI, AND POK MAN LO (WROCŁAW U.) PÉTER KOVÁCS, GYÖRGY WOLF (WIGNER RCP)

XVII Polish Workshop on Relativistic Heavy-Ion Collisions Warsaw University of Technology, 2024. 12. 14-15. What are the typical sizes?

- Typical size of the fireball in heavy ion collisions is a few fm.
- Neutron stars and **compact stars** built up from strongly interacting matter (with extra structure) with a size  $\sim$  10 km.
- Several models with finite (different) size.
- In field theoretical calculations (LSM, NJL, DS, etc): infinite size.

Why does it matter?

- The properties of the system can change significantly.
- Criticality in a finite system?
- The CEP and the first-order region might "disappear".

Might be studied in field theoretical models by implementating the finite size effects.

The vicinity of the CEP is accessible with models that are in the thermodynamic limit. How to consider the finite size effects without losing the advantages of these models?

## FINITE SIZE EFFECTS IN DIFFERENT MODELS (EXAMPLES)

### LSM

Effective model to study the phase diagram of strongly interacting matter at finite T and  $\mu$ .

- Quark-Meson model: "simple" linear sigma model with quarks and mesons O(N) model,  $N_f = 2$ , 2 + 1 LSM's
- Based on **chiral symmetry** broken spontaneously with also explicit breaking and the axial anomaly taken into account
- Can be extended with vector and axial vector nonets (eLSM)
   Phys. Rev. D 93, no. 11, 114014 (2016)
   Isospin symmetric case: 16 mesonic degrees of freedom.
- Polyakov might be added for "statistical confinement": Polyakov loop variables give 2 order parameters  $\Phi,\ \bar{\Phi}.$
- Lagrangian:

Mesonic part (terms up to 4th order by symmetry + breaking) Yukawa type fermionic part (constituent quark massed from the SSB)

### THE GRAND POTENTIAL

Thermodynamics: Mean field level effective potential:

- Classical potential.
- · Fermionic one-loop correction with vanishing fluctuating mesonic fields.

$$ar{\psi}\left( i\gamma^{\mu}\partial_{\mu} - {\sf diag}(m_u,m_d,m_s) 
ight)\psi$$

Functional integration over the fermionic fields. The momentum integrals are renormalized.

• Polyakov loop potential.

$$\Omega(T, \mu_q) = U_{Cl} + \operatorname{tr} \int_{K} \log\left(iS_0^{-1}\right) + U(\Phi, \bar{\Phi})$$
(1)

Field equations (FE):

$$\frac{\partial\Omega}{\partial\phi_{\mathsf{N}}} = \frac{\partial\Omega}{\partial\phi_{\mathsf{S}}} = \frac{\partial\Omega}{\partial\bar{\Phi}} = \frac{\partial\Omega}{\partial\Phi} = \mathbf{0}$$
(2)

**Curvature meson masses:** 

$$M_{ab}^{2} = \left. \frac{\partial^{2} \Omega}{\partial \varphi_{a} \partial \varphi_{b}} \right|_{\{\varphi_{i}\}=0}$$
(3)

Thermodynamics: Mean field level effective potential:

- Classical potential.
- · Fermionic one-loop correction with vanishing fluctuating mesonic fields.

$$ar{\psi}\left( i\gamma^{\mu}\partial_{\mu} - {\sf diag}(m_u,m_d,m_s) 
ight)\psi$$

Functional integration over the fermionic fields.

The momentum integrals are renormalized. Only this term is modified

• Polyakov loop potential.

$$\Omega(T, \mu_q) = U_{Cl} + \operatorname{tr} \int_{K} \log\left(iS_{O}^{-1}\right) + U(\Phi, \bar{\Phi})$$
(1)

Field equations (FE):

$$\frac{\partial\Omega}{\partial\phi_{\mathsf{N}}} = \frac{\partial\Omega}{\partial\phi_{\mathsf{S}}} = \frac{\partial\Omega}{\partial\bar{\Phi}} = \frac{\partial\Omega}{\partial\Phi} = \mathbf{0}$$
(2)

**Curvature meson masses:** 

$$M_{ab}^{2} = \left. \frac{\partial^{2} \Omega}{\partial \varphi_{a} \partial \varphi_{b}} \right|_{\{\varphi_{i}\}=0}$$
(3)

Phys. Rev. D 108 no.7, 076010 (2023)

• Fermionic vacuum and matter contribution:

 $\Omega_{ar{q}q}( au,\mu_q)=\Omega_{ar{q}q}^{\mathsf{vac}}+\Omega_{ar{q}q}^{\mathsf{mat}}( au,\mu_q)$ 

- The size dependence of  $\Omega_{\bar{q}q}^{\rm vac}$  pushes the system towards chiral restoration
- At T = 0 and  $\mu_q = 0$  the physical quantities also show the restoration

- With  $L = \infty$  vacuum part the chirally broken phase expands and the CEP is present even for very small sizes
- With *L* dependent vacuum part the chirally broken phase will be reduced.

The CEP disappears at L = 2.5 fm, as well as the broken phase at L = 2 fm.

What is the **boundary condition**?

• APBC: 
$$\frac{(2\pi)^2}{L^2} \sum_n \left(n + \frac{1}{2}\right)^2$$
  
• PBC:  $\frac{(2\pi)^2}{L^2} \sum_n n^2$   
• Something else  
e.g. SWC:  $\frac{(\pi)^2}{L^2} \sum_n n^2$

----

Shape of the finite volume: usually cubic, sometimes spherical

- Fermionic vacuum contribution: The solution is not stable for large  $\phi_N$  and  $\phi_S$ .
- With size-dependent vacuum contribution the condensates will increase for APBC (if L > 1 fm) and for PBC
- No common solution for the field equation for  $L \lesssim 4.5$  fm.

- Fermionic matter contribution: Fermi-Dirac statistics to Fermi surface at *T* = 0
- Discrete modes with sharp Fermi surface: staircase-like transition.
- For QM, NJL, and FRG as well

## **CEP WITH APBC**

LSM A: J. Phys. G **38**, 085101 (2011) LSM B, C: Phys. Rev. D **79**, 014018 (2009) eLSM: Phys. Rev. D **93**, 114014 (2016)

- For "higher lying" models there is a continuous path
- For the "low lying" models the  $L \rightarrow \infty$  CEP and the  $L \rightarrow$  0 CEP is not continuously connected
- At L < 2 fm the CEP is governed by the first mode entering below the Fermi surface

## **CEP WITH APBC**

LSM A: J. Phys. G **38**, 085101 (2011) LSM B, C: Phys. Rev. D **79**, 014018 (2009) eLSM: Phys. Rev. D **93**, 114014 (2016)

- For "higher lying" models there is a continuous path
- For the "low lying" models the  $L \rightarrow \infty$  CEP and the  $L \rightarrow$  0 CEP is not continuously connected
- At L < 2 fm the CEP is governed by the first mode entering below the Fermi surface

- FRG on QM model by Almási at al: PRD 95, no.5, 056015 (2017)
- Two apparent critical points "lower lying" CEP at  $L = \infty$

- With vacuum part of  $L = \infty$ new unphysical first-order transition below  $L \approx 5.5$  fm
- With (partially included) size-dependent vacuum part the trend is reversed.
- LSM A with zero mode added: J. Phys. G **38**, 085101 (2011)

- Identify criticality in experiments with finite size, critical slow down, etc.: Quantities depending on a high power of the correlation length
- + Conserved charge fluctuations  $\rightarrow$  Baryon fluctuations
- Ratio of generalized susceptibilities: no explicit size dependence

$$\chi_n = \frac{\partial^n p / T^4}{\partial (\mu_q / T)^n} \bigg|_{T}, \qquad S\sigma = \frac{\chi_3}{\chi_2}, \quad \kappa \sigma^2 = \frac{\chi_4}{\chi_2}$$
(4)

skewness, kurtosis

• Can be calculated and measured (not exactly the same quantities)

### BARYON FLUCTUATIONS - KURTOSIS THROUGH THE CEP

- No / moderate modification, only at very small sizes.
- · Location of CEP might be important. Determines the modification in an absolute location.
- Pronlems: not enough resolution or divergence at the CEP.

16

### BARYON FLUCTUATIONS - KURTOSIS THROUGH THE CEP

- The CEP is already very close to the μ<sub>q</sub> axis.
- · Inset: decreasing trend.

- No / moderate modification, only at very small sizes.
- Location of CEP might be important. Determines the modification in an absolute location.
- Pronlems: not enough resolution or divergence at the CEP.

### SUMMARY

- The CEP moves to lower T and higher  $\mu_q$  with the decreasing size.
- The details of the finite size effects depend on the used momentum space constraint, the boundary condition, and the treatment of the vacuum part.
- With low momentum cutoff, the size-dependent vacuum term leads to the reduction of the chirally broken phase, and the disappearance of the CEP when the size decreases, contrary to the case with unmodified vacuum contribution.
- With discretization the CEP will be determined by the modes entering below the Fermi surface. The location of the  $L \rightarrow \infty$  CEP strongly affects its trajectory with the decreasing size. The vacuum part has an especially strong effect in the case of PBC.
- Small effect on the baryon fluctuations, but the relocation of the CEP is important.
- New methods to better understand the volume dependence of the CEP.

# THANK YOU!
