

# Conclusion on Beam Instrumentation and Diagnostics

*JUAS 2025, ESI-Archamps at CERN*  
 Peter Forck (GSI and University Frankfurt)

## Diagnostics is the 'sensory organ' for the beam.

It required for operation and development of accelerators

### Four types of demands leads to different installations:

- Quick, non-destructive measurements leading to a single number or simple plots.
- Instrumentation for daily check, malfunction diagnosis and wanted parameter variation.
- Complex instrumentation used for hard malfunction and accelerator development.
- Automated measurement and control of beam parameters i.e. feedback

A clear interpretation of the results is a important design criterion.

### General comments:

- Good knowledge of accelerators, general physics and technologies is needed.
  - Quite different technologies are used, based on various physics processes.
  - Each task and each technology calls for an expert.
  - Accelerator development goes parallel to diagnostics development.
- ⇒ Interesting and challenging subject!

**LINAC & transport lines:** Single pass ↔ **Synchrotron:** multi pass

**Electrons:** always relativistic ↔ **Protons/Ions:** non-relativistic for  $E_{kin} < 1 \text{ GeV/u}$

**Depending on application:** Low current ↔ high current

## Overview of the most commonly used systems:

Beam quantity		LINAC & transfer line	Synchrotron
Current $I$	<i>General</i>	Transformer, dc & ac Faraday Cup	Transformer, dc & ac
	<i>Special</i>	Particle Detectors	Pick-up Signal (relative)
Profile $x_{width}$	<i>General</i>	Screens, SEM-Grids Wire Scanners, OTR Screen	Ionization Profile Monitor Wire Scanner, Synchrotron Light Monitor
	<i>Special</i>	MWPC, Fluorescence Light	
Position $x_{cm}$	<i>General</i>	Pick-up (BPM)	Pick-up (BPM)
	<i>Special</i>	Using profile measurement	
Transverse Emittance $\epsilon_{tran}$	<i>General</i>	Slit-grid Quadrupole Variation	Ionization Profile Monitor Wire Scanner
	<i>Special</i>	Pepper-Pot	Transverse Schottky

# Beam Quantities and their Diagnostics II

Beam quantity		LINAC & transfer line	Synchrotron
Bunch Length $\Delta\varphi$	<i>General</i>	Pick-up	Pick-up Wall Current Monitor
	<i>Special</i>	Secondary electrons	Streak Camera Electro-optical laser mod.
Momentum $p$ and Momentum Spread $\Delta p/p$	<i>General</i>	Pick-ups (Time-of-Flight)	Pick-up (e.g. tomography)
	<i>Special</i>	Magnetic Spectrometer	Schottky Noise Spectrum
Longitudinal Emittance $\varepsilon_{long}$	<i>General</i>	Buncher variation	Pick-up & tomography
	<i>Special</i>	Magnetic Spectrometer	
Tune and Chromaticity $Q, \xi$	<i>General</i>	---	Exciter + Pick-up
	<i>Special</i>	---	Transverse Schottky Spectrum
Beam Loss $r_{loss}$	<i>General</i>	Particle Detectors	
Polarization $P$	<i>General</i>	Particle Detectors	
	<i>Special</i>	Laser Scattering (Compton scattering)	
Luminosity $L$	<i>General</i>	Particle Detectors	

- Destructive and non-destructive devices depending on the beam parameter.
- Different techniques for the same quantity ↔ Same technique for the different quantities.
