- HPS design choice

Three configurations/motorizations considered, and four shapes of pockets:

We need to make decision very soon based on impact on LHC beam, mechanical aspects, integration into cryostat, detector performance/integration, finally accessibility and safety

Four scenarios assuming:

- Four detector stations
- Stations with extended length (~20cm)
- Tracking detector cross-section 20x30 mm
(and 40 mm thick)
- Displacements by up to 30 mm

One long indent

1 Mouvement

Découpe sur 7m de long
Autant de détecteurs que l'on veut
Déplacement sur 2 moteurs

Pros:

- One simple structure
- Only one entrance window
- Flexibility in number of detectors/positions

Cons:

- Thick wall/window - here 0.5 mm
- Stability/deformations of thin wall
- No flexibility/redundancy in moving scenarios

Four independent stations/sections

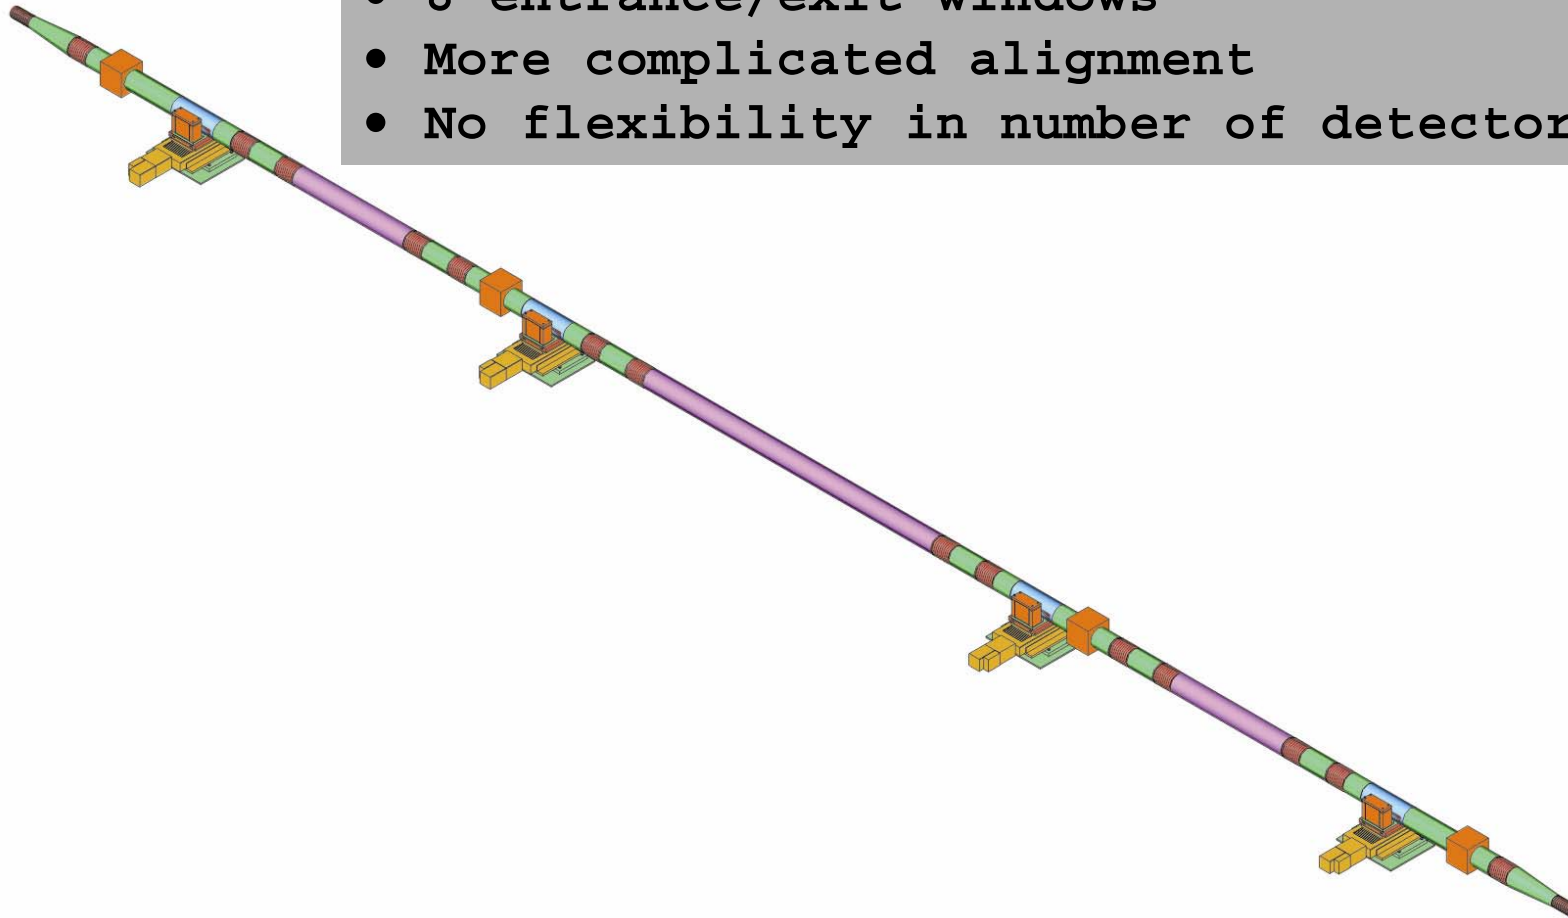

Pros:

- Four identical (?) structures (each w/ BPM?)
- Thin wall/windows - here 0.2 and 0.3 mm
- Flexibility/redundancy in moving scenarios

Cons:

- 8 entrance/exit windows
- More complicated alignment
- No flexibility in number of detectors/positions

Small pocket: thin walls of 0.2 mm

Small rectangular pocket: thin walls of 0.2 mm

Long pocket: thin walls of 0.3 mm

Two independent sections

Autant de découpe qu'il y a de détecteurs
 Autant de moteurs qu'il y a de détecteurs
 Ici, on a 4 détecteurs avec 2 mouvements

Pros:

- Two identical (?) structures (each w/ BPM)
- Thin wall/windows - here 0.2 mm
- Some flexibility/redundancy in moving scenarios

Cons:

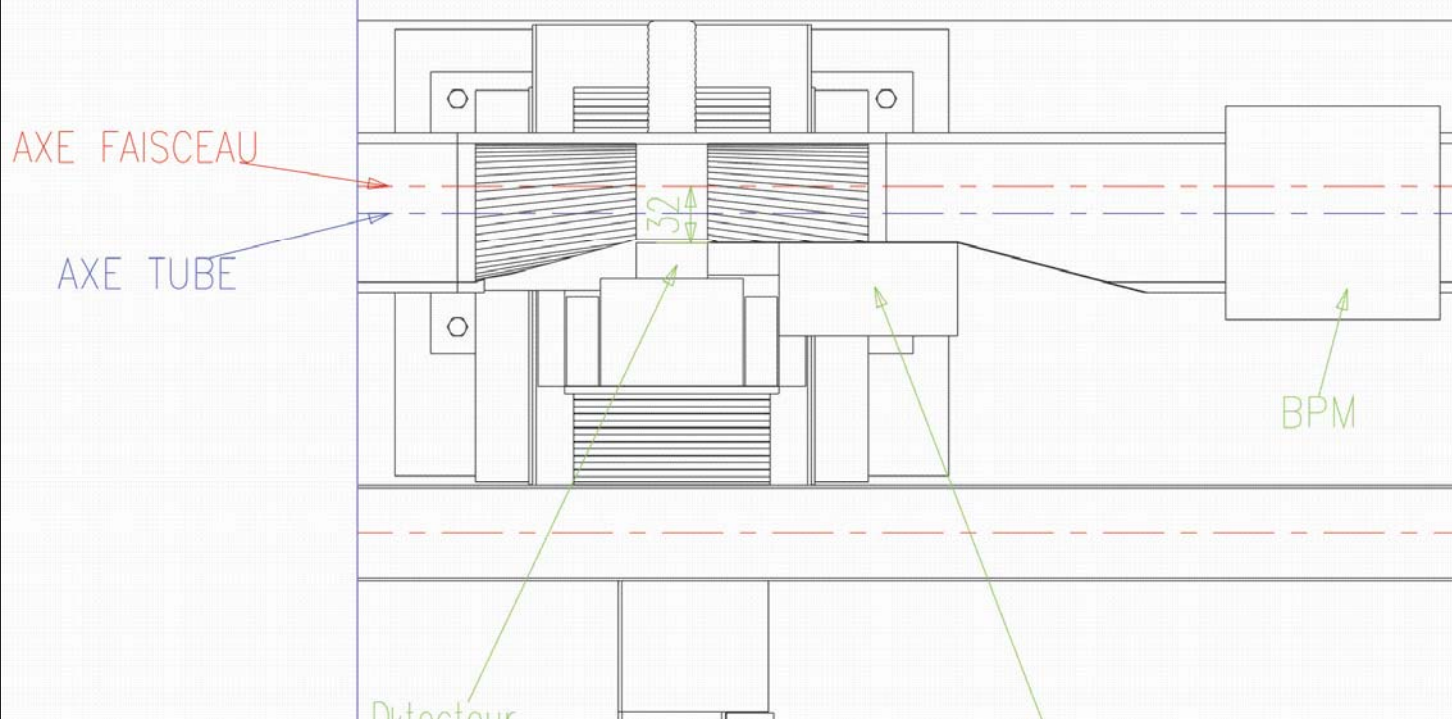

- 8 entrance/exit windows
- No flexibility in number of detectors/positions

Detector
fixing/support/
positioning/security

For discussion

To make decision needs to evaluate:

- impact on LHC beam - RF studies (pocket shape),
- mechanical aspects - precision, stability,
- integration into cryostat,
- detector performance (resolutions)/integration (cooling),
- accessibility and safety

Next steps

Given dimensions and shape of volume for HPS in CC, design will be further continued..

Plan to make first prototypes of pockets asap: urgently need decision on preferred scenario

Then, various lab tests will follow:

Vacuum/leak tests

Temperature cycles

...
