

**GEANT4**  
A SIMULATION TOOLKIT

# Hadronic Physics Highlights of Geant4 11.3

Alberto Ribon  
CERN EP-SFT

*On behalf of the Geant4 Hadronic Physics Working Group*

Geant4 Technical Forum, CERN, 12 December 2024

# Hadronic Data Sets (1/2)

- Updated the main hadronic data sets
  - G4ENSDFSTATE3.0 , PhotonEvaporation6.1 , RadioactiveDecay6.1.2
    - Updated with the ENSDF (Evaluated Nuclear Structure Data File) data from March 2024
    - **More consistent treatment of nuclides with incomplete information, and with fewer unphysical states**
- Others
  - Updated G4PARTICLEXS4.1
    - Updated cross sections for all isotopes for neutron, proton, and light ion projectiles
    - Fixed cross sections for Argon, Promethium, Astatine, Radon, and Francium
    - Fixed low-energy limits of cross sections
  - New, optional data sets : **G4NUDEXLIB1.0** , **G4URRPT1.1**
    - The first is used by the new model NuDEX, through the environmental variable G4NUDEXLIBDATA
    - The second is used by the new URR treatment of low-energy neutrons, through the environmental variable G4URRPTDATA

# Hadronic Data Sets (2/2)

- Updated :
  - G4ENSDFSTATE3.0 (mandatory for FTFP\_BERT)
  - PhotonEvaporation6.1 (mandatory for FTFP\_BERT)
  - RadioactiveDecay6.1.2 (mandatory for FTFP\_BERT)
  - G4PARTICLEXS4.1 (mandatory for FTFP\_BERT)
- Unchanged :
  - G4SAIDDATA2.0 (mandatory for FTFP\_BERT)
  - G4INCL1.2
  - G4ABLA3.3
  - G4NDL4.7.1
  - TENDL1.4
- New, optional :
  - G4NUDEXLIB1.0
  - G4URRPT1.1

# Hadronic Cross Sections

- Updated cross section classes to rationalise initialisation of data in MT mode
  - In view of the parallelisation of physics initialisation planned for next year
- New class *G4InterfaceToXS* , to compute inverse cross sections based on G4PARTICLEXS cross sections for neutron and light ions
  - Used to evaluate evaporation probabilities in nuclear de-excitation
- Optimised *G4ChargeExchangeXS* , by switching computations from isotopes to elements and making the code running faster without loss of accuracy
  - Used in the physics list constructor *G4ChargeExchangePhysics* – currently utilised only in the QBBC reference physics list

# String Models

- **Fritiof (FTF) model**
  - No physics development after G4 11.2
  - On-going physics validation
- **Quark-Gluon String (QGS) model**
  - No physics development after G4 11.2
  - On-going physics validation

# Intra-nuclear Cascade Models

- **BERT** (Bertini-like cascade)
  - **Improved angular emissions for 4-body and higher-body generation**
    - BERT becomes closer to FTFP, and this has an impact on hadronic showers
    - Reminder: BERT is the most used, workhorse cascade model in HEP
- **BIC** (Binary Cascade)
  - Stable
    - Reminder: used in medical physics, and sometimes in HEP for evaluating systematic errors
- **INCLXX** (Liege cascade)
  - Consolidation of the antiproton physics introduced in 11.2
    - Great interest in this recent development from the antiproton physics experiments at CERN, as well as in astroparticle experiments (e.g. GAPS)
    - Reminder: INCLXX is used in production by ALICE; moreover, there is a growing interest by the neutrino community...

# PreCompound

- Changed treatment of inverse cross sections
  - From Kalbach's parameterisation (Option 3) to *G4NeutronInelasticXS* & *G4ParticleInelasticXS* (Option 1)

# Nuclear De-excitation

- Several technical changes, a few physics fixes and improvements
  - Fixed usage of pairing corrections, with better agreement with experimental data
  - Fixed computation of the minimal kinetic energy of fragments and use of Coulomb barrier
  - Simplified computation of corrections and probabilities
  - Introduced a new class, *G4InterfaceToXS*, to compute the inverse cross sections
    - Based on *G4PARTICLEXS* for neutron and light ions
  - ...

# Including NuDEX in Geant4

- New alternative and more sophisticated nuclear de-excitation model, for the emission of gammas and internal conversion electrons
  - Useful for more precise simulations of gamma and electron emissions in nuclear reactions
  - Relies on a new hadronic data set, G4NUDEXLIB1.0 (~80 MB, ascii files)
    - Various parameters from ENSDF, BrICC, RIPL-3, and IAEA
    - Pointed by the environmental variable **G4NUDEXLIBDATA**
  - When it cannot be applied, it relies on *G4PhotonEvaporation*
  - For the time being, it can be used only for neutron capture when ParticleHP is utilised in the QGSP\_BERT\_HP physics list
    - To enable it, use the following C++ interface:  
***G4HadronicParameters::Instance()->SetEnableNUDEX( true );***
    - In the future, it will be possible to use it more generally, as an alternative evaporation model, as well as in other physics lists

# Unresolved Resonance Region (URR) treatment via Probability Tables (PT)

- Major physics improvement in the treatment of low-energy ( $< 20$  MeV) neutrons
  - Relevant for more precise simulations of nuclear reactor criticality and shielding applications
    - Making Geant4 another step closer to MCNP and TRIPOLI
  - Relies on a new data set, G4URRPT1.1 (~290 MB, compressed files)
    - Probability tables at temperature 293.15 K processed with both NJOY and CALENDF, from the JEFF-3.3 library and consistent with G4NDL4.7.1
    - Pointed by the environmental variable **G4URRPTDATA**
  - By default, it is not included
    - It can be activated on top of any reference physics list based on HP (or HPT) by using the new physics list constructor class **G4URRNeutrons**
    - The choice of the type of PT between NJOY or CALENDF is done via C++ interface, e.g. **G4HadronicParameters::Instance()->SetTypeTablePT( "calendf" );**

# Notes

- **QGSP\_BERT\_HP**
  - Since Geant4 version 11.2, the physics list QGSP\_BERT\_HP has a treatment of low energy (< 20 MeV) neutrons which is not the same as for the other HP-based reference physics lists (FTFP\_BERT\_HP, QGSP\_BIC\_HP, Shielding, etc.)
  - QGSP\_BERT\_HP is still under validation, therefore it is not recommended for physics studies, but users are welcome to try out and provide feedback
- **Radioactive Decay**
  - *G4RadioactiveDecay* has been renamed ***G4VRadioactiveDecay*** , and *G4Radioactivation* has been renamed ***G4RadioactiveDecay***
  - The header for *G4Radioactivation* is preserved to provide backward compatibility

# Hadronic showers *(see plots in backup slides)*

- For nearly all reference physics lists, hadronic showers in G4 **11.3** have
  - ~ 1-2% higher energy response and
  - ~ 5% narrower lateral showersthan those of G4 11.2
- Due to the improvement in the angular emission of  $\geq 4$  bodies in BERT, reducing the differences between this model and FTFP
- QGSP\_BERT showers with respect to FTFP\_BERT ones in G4 11.3 :
  - ~ 1-2% higher energy response
  - ~ **10% wider (*i.e.* less optimistic) energy resolution**
  - ~ 5% longer showers
  - ~ 4% narrower showers

# geant-val.cern.ch

- The validation and testing suite of Geant4
- We rely heavily on it for all releases
  - For major, minor, patches and monthly development versions
- On-going work to extend its coverage
  - Added in 2024 the CMS HGCal test-beam set-up, important for both physics validation and computing performance studies
  - On-going work to include benchmarks for low-energy neutrons, comparing with reference codes – MCNP & Tripoli
