

Deploying a CTA Test Instance using Helm

Thursday 27 March 2025 15:15 (15 minutes)

The current CTA test instance is deployed using Helm, a tool that streamlines the installation and management of Kubernetes applications. It allows us to clearly separate and template the different components that make up CTA. In this talk, we will walk through how the new containerized CTA setup works, covering how the components are organized, how Helm is used to manage configurations, and the deployment process.
