

XRootD Transfers Monitoring

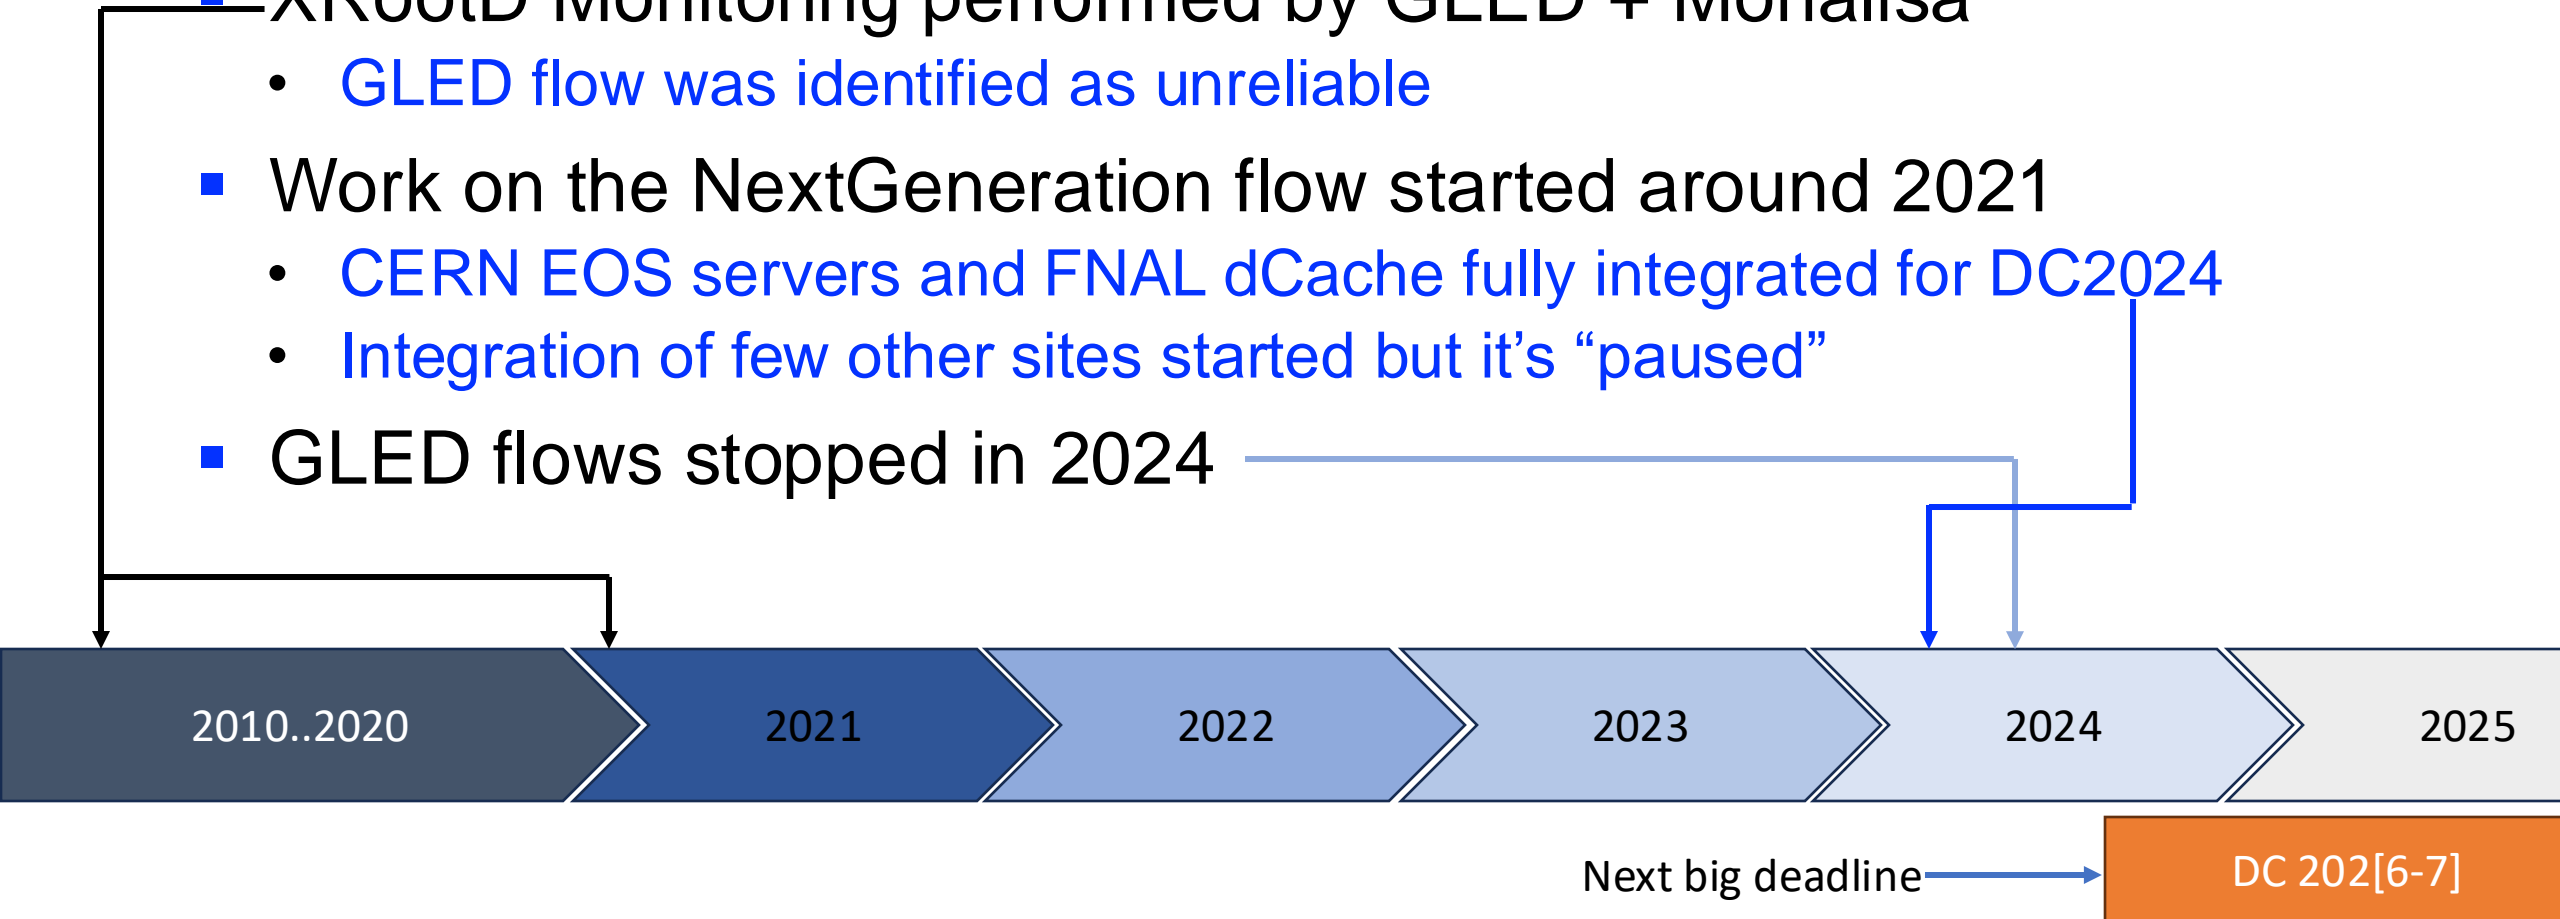

Borja Garrido
(on behalf of WLCG monitoring task force)

Introduction/Disclaimer

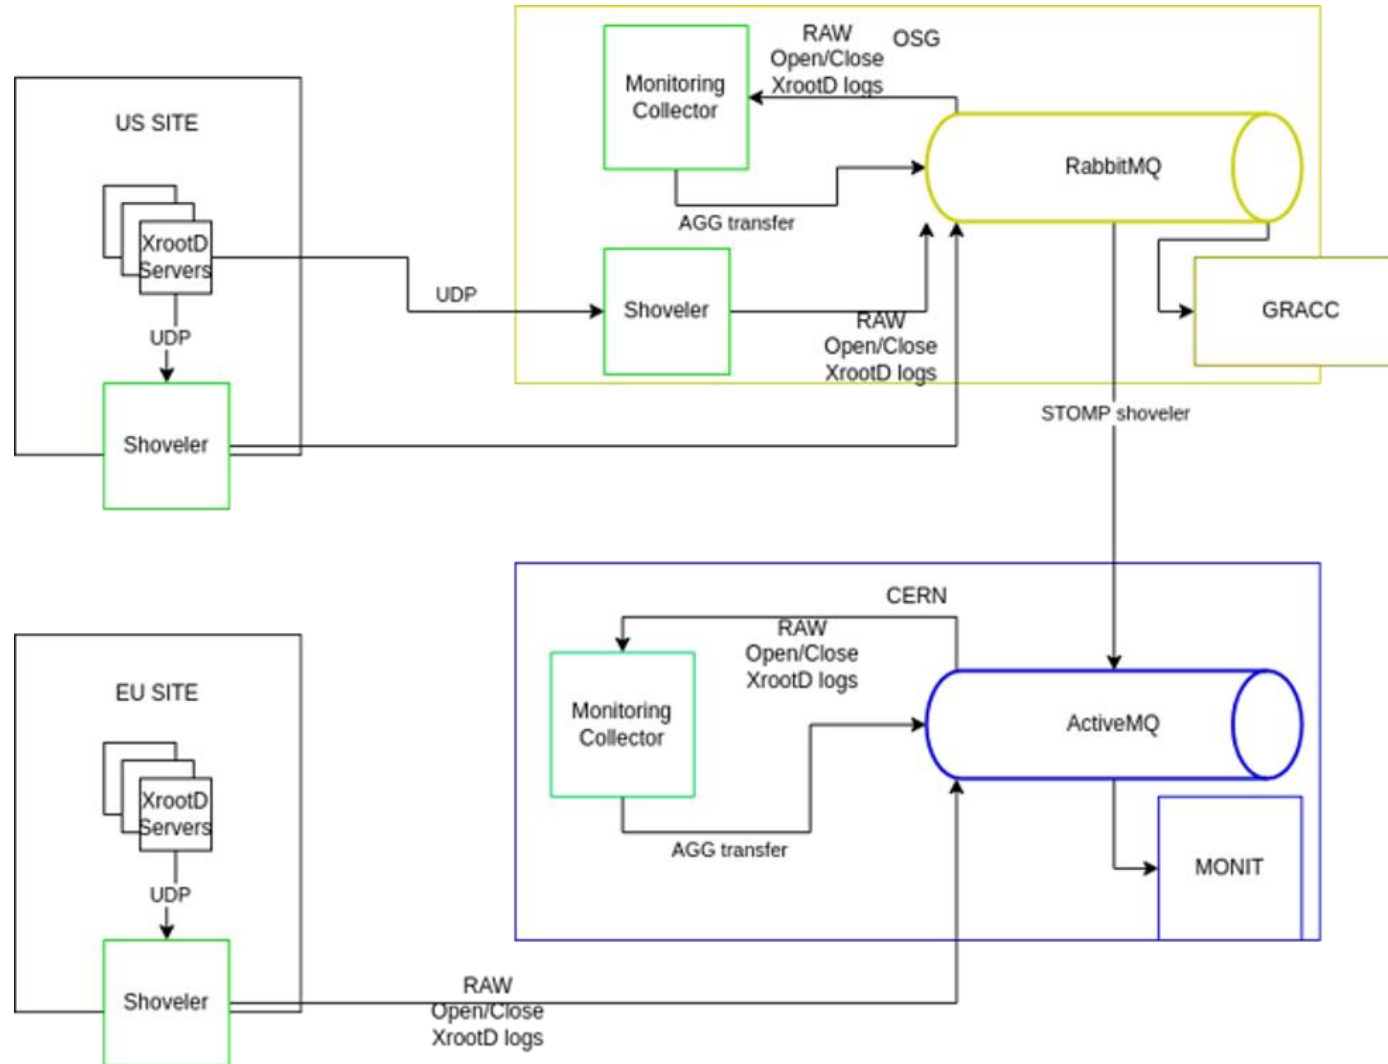

- Cover the status of the XRootD transfers Monitoring for WLCG
 - We are in convoluted times of change
- Talk provided from the Monitoring perspective
 - I'm not an XrootD nor dCache expert by any means
- Special focus on the IP version identification

The Long Story Short

- XRootD Monitoring performed by GLED + Monalisa
 - GLED flow was identified as unreliable
- Work on the NextGeneration flow started around 2021
 - CERN EOS servers and FNAL dCache fully integrated for DC2024
 - Integration of few other sites started but it's "paused"
- GLED flows stopped in 2024

IPv6 Field

- Can be found across all flows (Monalisa, NG, dCache)
- It's not reliable as it's represented by a Boolean
 - True: Transfer is identified as IPv6
 - False: Transfer is not identified as IPv6 (either IPv4 or not known)
- FTS introduced the “ipver” field counterpart
 - Allows for better understanding of the state: 4, 6, unknown...
 - It has been requested to have the same in XRootD
 - Work ongoing on the MONIT side

IP version: Monalisa

- Monalisa doesn't report any IP related information
- IPv6 Field added by MONIT always as “false”
 - Not reliable
- We will need to set the new “ipver” field to “unknown”
 - Not very useful and probably won't be done

IP version: Next Generation

- Extracted from the client logging information
 - XRootD streams send 4 or 6
 - Collector translates this to IPv6 true or false
 - If there's no loginfo (stream missing) it will still send false
- Plan to add “ipver” field in the collector
 - Take directly what XRootD sends and set “unknown” if not available

IP version: dCache

- Information based on the client IP settings
 - I do assume this is reliable but don't know the insights
- Already providing the “ipver” field
 - Not showing in the dashboard as other XRootD flows don't have it yet

Summary

- XRootD Monitoring is currently in a “semi” reliable state
 - Few sites fully integrated (not sure if validated)
 - Few things still to tweak
 - Multi-VO sites, IP version info...
- ipver information should start appearing in the next weeks
 - Dashboards will be changed to allow the usage of the field

Q&A

Thank you!
