

Test of new BB Finemet controller

T. Gavric, B. Woolley, H. Damerau, Y. Brischetto, M. Vadai

IPP MD Days

05/02/25

Many thanks to PSB/PS operations team

Outline

- **Previous work**
- **Synchronization scheme**
- **New features**
- **Change in the current setup**
- **Plans for 2025**
- **MD topics**

Previous work

- **Barrier-bucket MTE scheme significantly reduces beam loss in PS extraction region**
- **Non-PPM barrier waveform**
 - **Lacked flexibility**
- **2 consolidation boards**
 - **h16 measurement**
 - **h1 measurement**

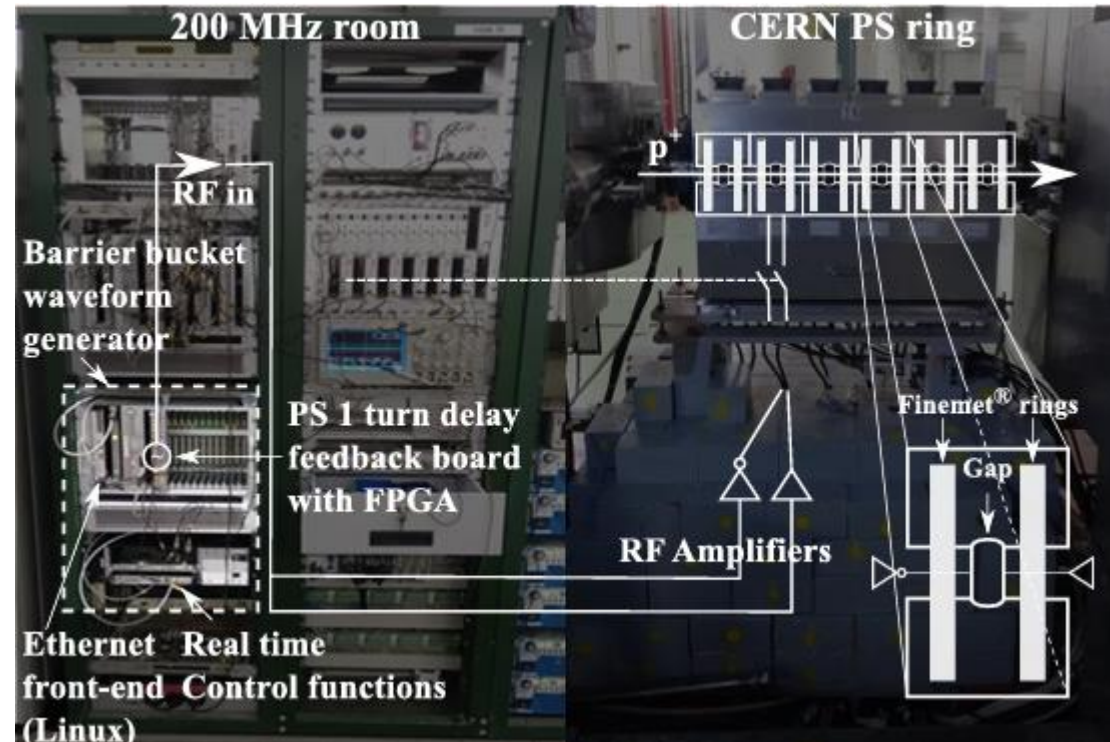

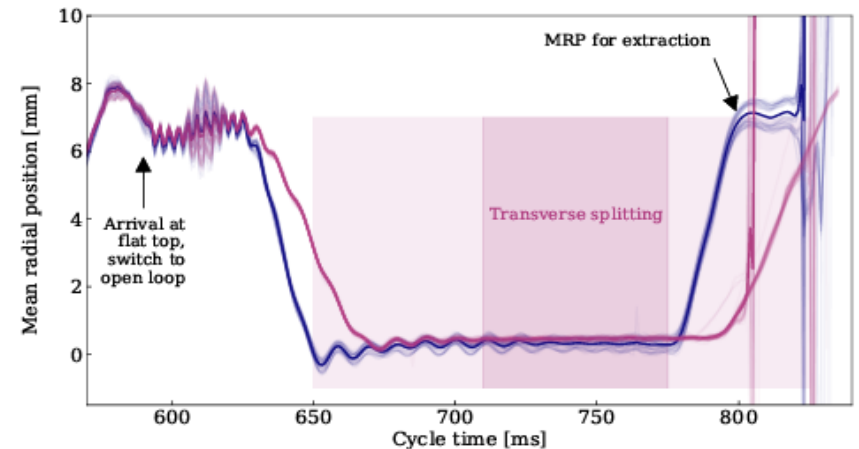

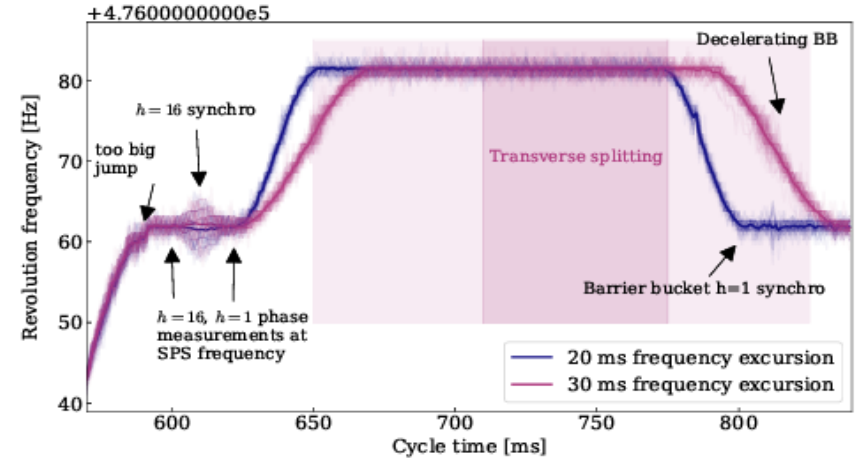

Diagram from M. Vadai, A. Alomainy, H. Damerau: Barrier Bucket Studies in the CERN PS (CC-BY 3.0) - <https://doi.org/10.18429/JACoW-IPAC2019-MOPTS106>

Synchronization scheme

- Conventional synchronisation not possible
 - RF voltage of the wide-band cavity generating the BB would be too low for a conventional synchronisation
- Synchronisation concept in use:
 - Synchronising in h16 using feed-forward cogging
 - Lower accuracy sufficient for barrier buckets
 - Synchronisation in h1: phase measurement and communicating phase information within a cycle to set the correct barrier position

New features (1)

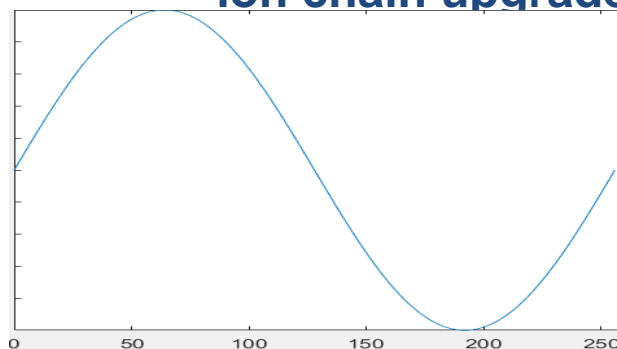

- **Full control of RF drive voltage**
 - **PPM**
 - **Arbitrary waveform**
 - **16-bit waveform memory**
- **Acquisition of gap voltage**
 - **Single turn**
 - **Hard trigger (from CTRV through backplane)**
 - **PAX.SACQ-ALLRFM**
- **Arbitrary gain function of the waveform**
 - **FGC: Internal function generator – new preferred option (makerule from old function)**
 - **CVORB**

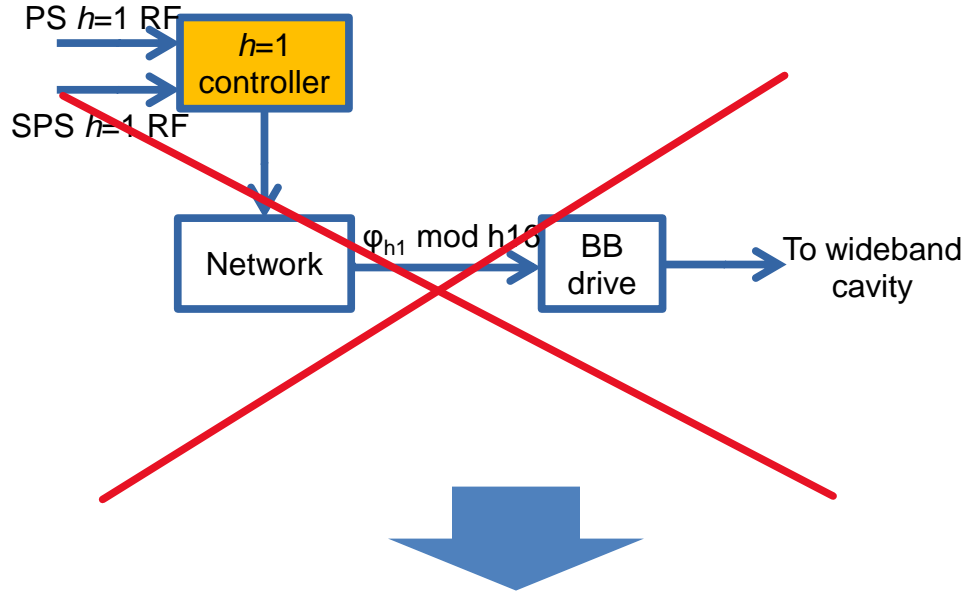

New features (2)

Following features are yet to be tested with the beam:

- **New extraction synchro for PS: h1 measurement w.r.t. SPS derived h1**
 - Updates BB azimuth during the cycle (C620 ms)
- **PS acquisition core**
 - Gain function
 - h1 measurement – phase between SPS derived h1 and PS h1
- **Accordion sweep of the waveform**
 - Time in which sweep happens can be set
 - Used for smooth batch compression – interesting for possible ion chain upgrade

Change in h1 measurement

New Finemet cavity controller

- $h=1$ controller measures the phase w.r.t. SPS and sends it real-time via C programs on front-ends to the barrier bucket drive

- Non-standardized hardware removed
- Enables remote intervention

Plans for 2025

- Deploy new firmware during commissioning period
- Deploy operational FESA class for the new cavity controller during 24/25 YETS
- Increase number of turns acquired – up to 16 turns
- Test new features with the beam
- **Add relay for remote interventions on NIM crate powering h16 controller??**
- Develop BB IP as a part of new digital PS beam control
 - Removes remaining controller used for h16 measurement

MD topics

- **Explore the benefits of Finement cavity with new software and firmware beyond barrier buckets**
 - **Transient beam loading compensation**
 - **Smooth batch compression (h21 → h42) for Oxygen ion run**
