

Very High Energy Cosmic Rays: Status, Puzzles, and the Impact of LHC data

Sergey Ostapchenko (NTNU, Trondheim)

ISMD-2011, Hiroshima, September 26-30, 2011

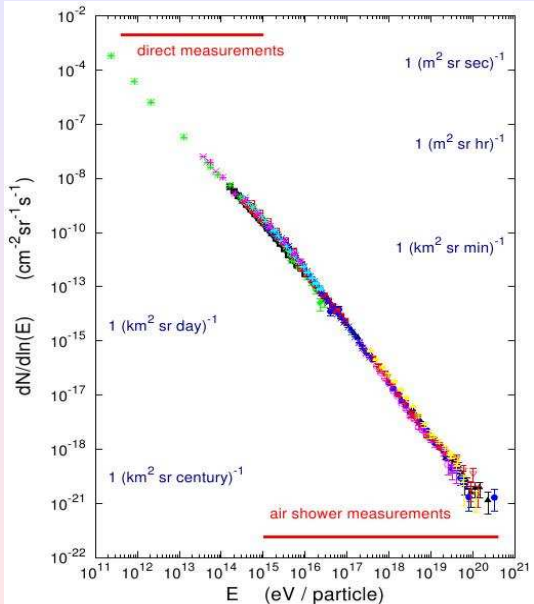

High Energy Cosmic Rays

- almost featureless spectrum
- extends over > 10 orders of magnitude
- flux steeply falling down with energy
- \Rightarrow direct detection till $\sim 10^{15}$ eV only
- primary particles – protons & nuclei (up to *Fe*)

High Energy Cosmic Rays

- almost featureless spectrum
- extends over > 10 orders of magnitude
- flux steeply falling down with energy
- \Rightarrow direct detection till $\sim 10^{15}$ eV only
- primary particles – protons & nuclei (up to Fe)

High Energy Cosmic Rays

- flux steeply falling down with energy
- \Rightarrow direct detection till $\sim 10^{15}$ eV only
- primary particles – protons & nuclei (up to *Fe*)

High Energy Cosmic Rays

- almost featureless spectrum
- extends over > 10 orders of magnitude
- flux steeply falling down with energy
- \Rightarrow direct detection till $\sim 10^{15}$ eV only
- **primary particles – protons & nuclei (up to *Fe*)**

High Energy Cosmic Rays

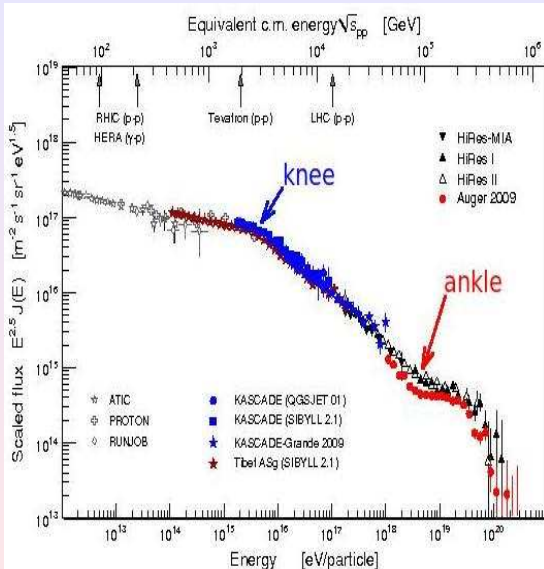

- flux $\times E^{2.5}$:
'leg'-like shape

High Energy Cosmic Rays

- flux $\times E^{2.5}$:
'leg'-like shape
- 'knee' around 3×10^{15} eV
(effect of galactic acceleration / propagation)

High Energy Cosmic Rays

- flux $\times E^{2.5}$:
'leg'-like shape
- 'knee' around 3×10^{15} eV
(effect of galactic acceleration / propagation)
- 'ankle' at $\text{few} \times 10^{18}$ eV
(galactic / extragalactic transition?)

High Energy Cosmic Rays

- flux $\times E^{2.5}$:
'leg'-like shape
- 'knee' around 3×10^{15} eV
(effect of galactic acceleration / propagation)
- 'ankle' at $\text{few} \times 10^{18}$ eV
(galactic / extragalactic transition?)
- cutoff at $\sim 10^{20}$ eV
(interaction with background γ s?)

Galactic Cosmic Rays

X-ray image of SNR Cas A

Galactic Cosmic Rays

Standard paradigm for galactic CR sources: supernova remnants

- SNRs provide sufficient energy budget for CRs (if $> 10\%$ of explosion energy is transferred to CRs)
- known astrophysical mechanism - diffusion shock acceleration

Galactic Cosmic Rays

Standard paradigm for galactic CR sources: supernova remnants

- SNRs provide sufficient energy budget for CRs
(if $> 10\%$ of explosion energy is transferred to CRs)
- known astrophysical mechanism - diffusion shock acceleration

Galactic Cosmic Rays

Standard paradigm for galactic CR sources: supernova remnants

- SNRs provide sufficient energy budget for CRs (if $> 10\%$ of explosion energy is transferred to CRs)
- known astrophysical mechanism - **diffusion shock acceleration**

Galactic Cosmic Rays

Standard paradigm for galactic CR sources: supernova remnants

- SNRs provide sufficient energy budget for CRs (if $> 10\%$ of explosion energy is transferred to CRs)
- known astrophysical mechanism - diffusion shock acceleration

CR 'knee' as an acceleration cutoff

- **DSA is able to accelerate protons up to the 'knee'** ($\sim 10^{15}$ eV)
- \Rightarrow the knee can be the signature of proton acceleration cutoff
- acceleration (by magnetic fields) depends on particle rigidity $E/Z \Rightarrow$ nuclei can be accelerated to (Z -times) higher energies
- \Rightarrow rigidity-dependent partial 'nuclear knees' may be expected (e.g. $E_{He}^{\text{knee}} = 2E_p^{\text{knee}}$, $E_{Fe}^{\text{knee}} = 26E_p^{\text{knee}}$)

Galactic Cosmic Rays

Standard paradigm for galactic CR sources: supernova remnants

- SNRs provide sufficient energy budget for CRs (if $> 10\%$ of explosion energy is transferred to CRs)
- known astrophysical mechanism - diffusion shock acceleration

CR 'knee' as an acceleration cutoff

- DSA is able to accelerate protons up to the 'knee' ($\sim 10^{15}$ eV)
- \Rightarrow the knee can be the signature of proton acceleration cutoff
- acceleration (by magnetic fields) depends on particle rigidity $E/Z \Rightarrow$ nuclei can be accelerated to (Z -times) higher energies
- \Rightarrow rigidity-dependent partial 'nuclear knees' may be expected (e.g. $E_{He}^{\text{knee}} = 2E_p^{\text{knee}}$, $E_{Fe}^{\text{knee}} = 26E_p^{\text{knee}}$)

Galactic Cosmic Rays

Standard paradigm for galactic CR sources: supernova remnants

- SNRs provide sufficient energy budget for CRs (if $> 10\%$ of explosion energy is transferred to CRs)
- known astrophysical mechanism - diffusion shock acceleration

CR 'knee' as an acceleration cutoff

- DSA is able to accelerate protons up to the 'knee' ($\sim 10^{15}$ eV)
- \Rightarrow the knee can be the signature of proton acceleration cutoff
- acceleration (by magnetic fields) depends on particle rigidity $E/Z \Rightarrow$ nuclei can be accelerated to (Z -times) higher energies
- \Rightarrow rigidity-dependent partial 'nuclear knees' may be expected (e.g. $E_{He}^{\text{knee}} = 2E_p^{\text{knee}}$, $E_{Fe}^{\text{knee}} = 26E_p^{\text{knee}}$)

Galactic Cosmic Rays

Standard paradigm for galactic CR sources: supernova remnants

- SNRs provide sufficient energy budget for CRs (if $> 10\%$ of explosion energy is transferred to CRs)
- known astrophysical mechanism - diffusion shock acceleration

CR 'knee' as an acceleration cutoff

- DSA is able to accelerate protons up to the 'knee' ($\sim 10^{15}$ eV)
- \Rightarrow the knee can be the signature of proton acceleration cutoff
- acceleration (by magnetic fields) depends on particle rigidity $E/Z \Rightarrow$ nuclei can be accelerated to (Z -times) higher energies
- \Rightarrow rigidity-dependent partial 'nuclear knees' may be expected (e.g. $E_{He}^{\text{knee}} = 2E_p^{\text{knee}}$, $E_{Fe}^{\text{knee}} = 26E_p^{\text{knee}}$)

Alternative explanation for the 'knee': propagation effect

- above certain energy CRs aren't efficiently scattered by turbulent magnetic fields of the Galaxy
- \Rightarrow CR escape from the Galaxy also produces rigidity-dependent 'knees'

Alternative explanation for the 'knee': propagation effect

- above certain energy CRs aren't efficiently scattered by turbulent magnetic fields of the Galaxy
- \Rightarrow CR escape from the Galaxy also produces rigidity-dependent 'knees'

Alternative explanation for the 'knee': propagation effect

- above certain energy CRs aren't efficiently scattered by turbulent magnetic fields of the Galaxy
- \Rightarrow CR escape from the Galaxy also produces rigidity-dependent 'knees'

Alternative explanation for the 'knee': propagation effect

- above certain energy CRs aren't efficiently scattered by turbulent magnetic fields of the Galaxy
- \Rightarrow CR escape from the Galaxy also produces rigidity-dependent 'knees'

Speculative scenario

- more exotic 'knee' explanations assume a **sudden change of hadronic physics above certain energy scale**
- \Rightarrow 'knee' position defined by total energy of the primary particle (independent on Z)

Alternative explanation for the 'knee': propagation effect

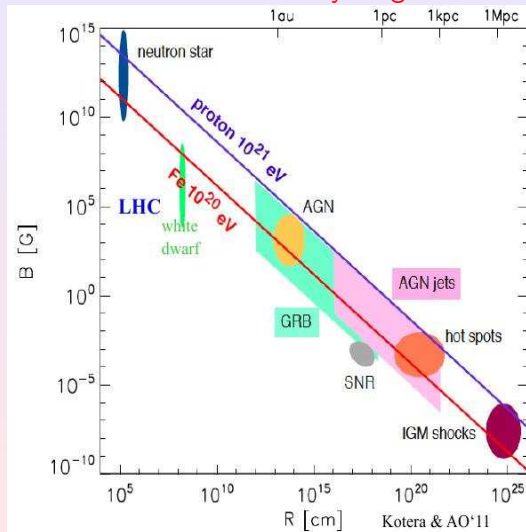

- above certain energy CRs aren't efficiently scattered by turbulent magnetic fields of the Galaxy
- \Rightarrow CR escape from the Galaxy also produces rigidity-dependent 'knees'

Speculative scenario

- more exotic 'knee' explanations assume a sudden change of hadronic physics above certain energy scale
- \Rightarrow 'knee' position defined by total energy of the primary particle (independent on Z)

Ultra-High Energy Cosmic Rays (UHECR)

Potential UHECR sources – Hillas's condition: CRs to be retained in the source for sufficiently long time $\Rightarrow E_{\max} \propto B_{\text{source}} R_{\text{source}}$

Ultra-High Energy Cosmic Rays (UHECR)

Potential UHECR sources – Hillas's condition: CRs to be retained in the source for sufficiently long time $\Rightarrow E_{\max} \propto B_{\text{source}} R_{\text{source}}$

- additional constraints – from energy losses in the source
- \Rightarrow UHECR sources – most likely extragalactic
- favorable option – Active Galactic Nuclei (AGN)

Ultra-High Energy Cosmic Rays (UHECR)

Potential UHECR sources – Hillas's condition: CRs to be retained in the source for sufficiently long time $\Rightarrow E_{\max} \propto B_{\text{source}} R_{\text{source}}$

- additional constraints – from energy losses in the source
- \Rightarrow UHECR sources – most likely extragalactic
- favorable option – Active Galactic Nuclei (AGN)

Ultra-High Energy Cosmic Rays (UHECR)

Potential UHECR sources – Hillas's condition: CRs to be retained in the source for sufficiently long time $\Rightarrow E_{\text{max}} \propto B_{\text{source}} R_{\text{source}}$

- additional constraints – from energy losses in the source
- \Rightarrow UHECR sources – most likely extragalactic
- favorable option – **Active Galactic Nuclei (AGN)**

Ultra-High Energy Cosmic Rays (UHECR)

nearest to us AGN – Centaurus A:

- additional constraints
– from energy losses
in the source
- \Rightarrow UHECR sources –
most likely
extragalactic
- favorable option –
Active Galactic
Nuclei (AGN)

Ultra-High Energy Cosmic Rays (UHECR)

nearest to us AGN – Centaurus A:

- additional constraints – from energy losses in the source
- ⇒ UHECR sources – most likely extragalactic
- favorable option – Active Galactic Nuclei (AGN)
- CR acceleration possible near the black hole or in a jet/lobe

AGNs already established as UHECR sources?

Pierre Auger Collaboration: correlation of UHECR arrival directions with nearby AGNs at 3σ level [*Science* 318 (2007) 938]

- correlation angular scale (3°) – consistent with expected deflections for protons
- considerable excess of events in the direction of CenA

AGNs already established as UHECR sources?

Pierre Auger Collaboration: correlation of UHECR arrival directions with nearby AGNs at 3σ level [*Science* 318 (2007) 938]

- correlation angular scale (3°) – consistent with expected deflections for protons
- considerable excess of events in the direction of CenA

AGNs already established as UHECR sources?

Pierre Auger Collaboration: correlation of UHECR arrival directions with nearby AGNs at 3σ level [*Science* 318 (2007) 938]

- correlation angular scale (3°) – consistent with expected deflections for protons
- considerable excess of events in the direction of CenA

AGNs already established as UHECR sources?

- however: correlation signal weakened for larger event sample
- now: 2σ deviation from isotropic distribution

AGNs already established as UHECR sources?

- however: correlation signal weakened for larger event sample
- now: 2σ deviation from isotropic distribution

AGNs already established as UHECR sources?

Telescope Array Collaboration: 8 events out of 20 correlate with AGNs [Sagawa, talk at TeVPA-2011]

- TA SD data beyond 57 EeV
- Veron catalog 12th edition AGN
 - $z < 0.018$
- Correlations of data with AGN within 3.1°

Number of TA data
correlated
with AGN

AGNs already established as UHECR sources?

Telescope Array Collaboration: 8 events out of 20 correlate with AGNs [*Sagawa, talk at TeVPA-2011*]

- TA SD data beyond 57 EeV
- Veron catalog 12th edition AGN
 - $z < 0.018$

- Correlations of data with AGN within 3.1°

Number of TA data
correlated
with AGN

- \Rightarrow consistent both with the isotropy and with the AGN correlation hypothesis

Propagation in extragalactic space & GZK cutoff

- why restrict oneself with nearby sources?

Propagation in extragalactic space & GZK cutoff

- why restrict oneself with nearby sources?
- the Universe is filled with 2.7K cosmological background radiation (CMB)

Propagation in extragalactic space & GZK cutoff

- why restrict oneself with nearby sources?
- the Universe is filled with 2.7K cosmological background radiation (CMB)
- \Rightarrow **UHE protons quickly loose energy on CMB**
[Greisen, *PRL* 16 (1966); Zatsepin & Kuzmin, *JETP Lett.* 4 (1966)]

\Rightarrow beyond ~ 100 Mpc the Universe is opaque for UHECR

Propagation in extragalactic space & GZK cutoff

- why restrict oneself with nearby sources?
- the Universe is filled with 2.7K cosmological background radiation (CMB)
- \Rightarrow UHE protons quickly lose energy on CMB
[Greisen, *PRL* 16 (1966); Zatsepin & Kuzmin, *JETP Lett.* 4 (1966)]

\Rightarrow beyond ~ 100 Mpc the Universe is opaque for UHECR

- for a uniform distribution of extragalactic CR sources results in a spectral cutoff at $E \sim 5 \times 10^{19}$ eV (GZK-cutoff)

Propagation in extragalactic space & GZK cutoff

- why restrict oneself with nearby sources?
- the Universe is filled with 2.7K cosmological background radiation (CMB)
- \Rightarrow UHE protons quickly loose energy on CMB
[Greisen, PRL 16 (1966); Zatsepin & Kuzmin, JETP Lett. 4 (1966)]

\Rightarrow beyond ~ 100 Mpc the Universe is opaque for UHECR

- for a uniform distribution of extragalactic CR sources results in a spectral cutoff at $E \sim 5 \times 10^{19}$ eV (GZK-cutoff)
- in turn, **UHE nuclei loose energy via photodisintegration on IR photons:** $A + \gamma \rightarrow (A - 1) + p/n \Rightarrow$ similar cutoff

Trans-GZK events & physics beyond the Standard Model?

Observation of trans-GZK events by the AGASA Collaboration
[PRL 81 (1998)]

Trans-GZK events & physics beyond the Standard Model?

Observation of trans-GZK events by the AGASA Collaboration
[PRL 81 (1998)]

⇒ non-SM explanations of UHECR origin:

- decays of cosmological relics: topological defects, superheavy X-particles
- Lorentz invariance violation
- 'Z-burst': annihilation of UHE (anti-)neutrinos with DM ones

Trans-GZK events & physics beyond the Standard Model?

Observation of trans-GZK events by the AGASA Collaboration
[PRL 81 (1998)]

⇒ non-SM explanations of UHECR origin:

- decays of cosmological relics: topological defects, superheavy X-particles
- Lorentz invariance violation
- 'Z-burst': annihilation of UHE (anti-)neutrinos with DM ones

Trans-GZK events & physics beyond the Standard Model?

Observation of trans-GZK events by the AGASA Collaboration
[PRL 81 (1998)]

⇒ non-SM explanations of UHECR origin:

- decays of cosmological relics: topological defects, superheavy X-particles
- Lorentz invariance violation
- 'Z-burst': annihilation of UHE (anti-)neutrinos with DM ones

Trans-GZK events & physics beyond the Standard Model?

Observation of trans-GZK events by the AGASA Collaboration
[PRL 81 (1998)]

⇒ non-SM explanations of UHECR origin:

- decays of cosmological relics: topological defects, superheavy X-particles
- Lorentz invariance violation
- 'Z-burst': annihilation of UHE (anti-)neutrinos with DM ones

Trans-GZK events & physics beyond the Standard Model?

Now: UHECR cutoff – observed by 3 independent collaborations

Trans-GZK events & physics beyond the Standard Model?

Now: UHECR cutoff – observed by 3 independent collaborations

- HiRes Collaboration
[PRL 100 (2008)]:
GZK-cutoff observed
with 5σ significance

Trans-GZK events & physics beyond the Standard Model?

Now: UHECR cutoff – observed by 3 independent collaborations

- HiRes Collaboration
[PRL 100 (2008)]:
GZK-cutoff observed
with 5σ significance
- Pierre Auger Collab.
[PRL 101 (2008)]:
cutoff observed with
 6σ significance

Trans-GZK events & physics beyond the Standard Model?

Now: UHECR cutoff – observed by 3 independent collaborations

- HiRes Collaboration
[PRL 100 (2008)]:
GZK-cutoff observed
with 5σ significance
- Pierre Auger Collab.
[PRL 101 (2008)]:
cutoff observed with
 6σ significance
- Telescope Array Collab.
[Stokes, ICRC-2011]:
cutoff observed with
 3.9σ significance

Trans-GZK events & physics beyond the Standard Model?

Now: UHECR cutoff – observed by 3 independent collaborations

- trans-GZK story - finally over

- HiRes Collaboration [*PRL 100 (2008)*]: GZK-cutoff observed with 5σ significance
- Pierre Auger Collab. [*PRL 101 (2008)*]: cutoff observed with 6σ significance
- Telescope Array Collab. [*Stokes, ICRC-2011*]: cutoff observed with 3.9σ significance

UHECR cutoff: GZK or not?

- UHECR also lose energy via e^+e^- -pair production on CMB:

$$p + \gamma \rightarrow p + e^+ + e^-$$

UHECR cutoff: GZK or not?

- UHECR also lose energy via e^+e^- -pair production on CMB:

- if UHECR are protons: **spectral 'dip' will be produced**

UHECR cutoff: GZK or not?

- UHECR also lose energy via e^+e^- -pair production on CMB:

- if UHECR are protons: spectral 'dip' will be produced
- 'dip' model for galactic-extragalactic transition
[Berezinsky & Grigor'eva, *A&A* 199 (1988)]
 - transition takes place well before the 'ankle'
 - observed CR 'ankle' \equiv pair production 'dip'
 - energy-relation between GZK cutoff and the 'ankle' (= 'dip')
 - well reproduced

UHECR cutoff: GZK or not?

- UHECR also lose energy via e^+e^- -pair production on CMB:

- if UHECR are protons: spectral 'dip' will be produced
- 'dip' model for galactic-extragalactic transition
[Berezinsky & Grigor'eva, A&A 199 (1988)]
 - transition takes place well before the 'ankle'
 - observed CR 'ankle' \equiv pair production 'dip'
 - energy-relation between GZK cutoff and the 'ankle' (= 'dip')
 - well reproduced

UHECR cutoff: GZK or not?

- UHECR also lose energy via e^+e^- -pair production on CMB:

- if UHECR are protons: spectral 'dip' will be produced
- 'dip' model for galactic-extragalactic transition
[Berezinsky & Grigor'eva, A&A 199 (1988)]
 - transition takes place well before the 'ankle'
 - **observed CR 'ankle' \equiv pair production 'dip'**
 - energy-relation between GZK cutoff and the 'ankle' (= 'dip')
– well reproduced

UHECR cutoff: GZK or not?

- UHECR also lose energy via e^+e^- -pair production on CMB:

- if UHECR are protons: spectral 'dip' will be produced
- 'dip' model for galactic-extragalactic transition
[Berezinsky & Grigor'eva, A&A 199 (1988)]
 - transition takes place well before the 'ankle'
 - observed CR 'ankle' \equiv pair production 'dip'
 - **energy-relation between GZK cutoff and the 'ankle' (= 'dip')**
 - well reproduced

UHECR cutoff: GZK or not?

- UHECR also lose energy via e^+e^- -pair production on CMB:

- if UHECR are protons: spectral 'dip' will be produced
- 'dip' model for galactic-extragalactic transition
[Berezinsky & Grigor'eva, A&A 199 (1988)]
 - transition takes place well before the 'ankle'
 - observed CR 'ankle' \equiv pair production 'dip'
 - energy-relation between GZK cutoff and the 'ankle' (= 'dip')
– well reproduced
- if UHECR = Fe: **no pronounced 'dip'**
- \Rightarrow galactic-extragalactic transition – at the 'ankle'

UHECR cutoff: GZK or not?

- UHECR also lose energy via e^+e^- -pair production on CMB:

- if UHECR are protons: spectral 'dip' will be produced
- 'dip' model for galactic-extragalactic transition
[Berezinsky & Grigor'eva, A&A 199 (1988)]
 - transition takes place well before the 'ankle'
 - observed CR 'ankle' \equiv pair production 'dip'
 - energy-relation between GZK cutoff and the 'ankle' (= 'dip')
– well reproduced
- if UHECR = Fe: no pronounced 'dip'
- \Rightarrow galactic-extragalactic transition – at the 'ankle'

UHECR cutoff: GZK or not?

- UHECR also lose energy via e^+e^- -pair production on CMB:

- if UHECR are protons: spectral 'dip' will be produced
- 'dip' model for galactic-extragalactic transition
[Berezinsky & Grigor'eva, A&A 199 (1988)]
 - transition takes place well before the 'ankle'
 - observed CR 'ankle' \equiv pair production 'dip'
 - energy-relation between GZK cutoff and the 'ankle' (= 'dip')
– well reproduced
- if UHECR = Fe: no pronounced 'dip'
- \Rightarrow galactic-extragalactic transition – at the 'ankle'

\Rightarrow measurements of CR composition – key to the UHECR puzzle

Extensive Air Shower (EAS) techniques of CR detection

observations of nuclear-e/m cascades induced by CR particles:

Extensive Air Shower (EAS) techniques of CR detection

ground-based observations (= thick target experiments)

- primary CR energy \iff charged particle density at ground
- CR composition \iff muon density at ground

Extensive Air Shower (EAS) techniques of CR detection

ground-based observations (= thick target experiments)

- primary CR energy \iff charged particle density at ground
- CR composition \iff muon density at ground

Extensive Air Shower (EAS) techniques of CR detection

ground-based observations (= thick target experiments)

- primary CR energy \iff charged particle density at ground
- CR composition \iff muon density at ground

Extensive Air Shower (EAS) techniques of CR detection

ground-based observations (= thick target experiments)

- primary CR energy \iff charged particle density at ground
- CR composition \iff muon density at ground

measurements of EAS fluorescence light

- primary CR energy \iff integrated light
- CR composition \iff shower maximum position X_{\max}

Extensive Air Shower (EAS) techniques of CR detection

ground-based observations (= thick target experiments)

- primary CR energy \iff charged particle density at ground
- CR composition \iff muon density at ground

measurements of EAS fluorescence light

- primary CR energy \iff integrated light
- CR composition \iff shower maximum position X_{\max}

Extensive Air Shower (EAS) techniques of CR detection

ground-based observations (= thick target experiments)

- primary CR energy \iff charged particle density at ground
- CR composition \iff muon density at ground

measurements of EAS fluorescence light

- primary CR energy \iff integrated light
- CR composition \iff shower maximum position X_{\max}

Extensive air shower development

- EAS development – driven by interactions of primary / 'leading' secondary particles
- \Rightarrow hadronic cascade = EAS backbone
- secondary cascades – well averaged
- observables used for CR composition studies – most sensitive to hadronic physics
- e.g. X_{max} : to $\sigma_{p\text{-air}}^{\text{inel}}$ and to 'inelasticity' $K_{p\text{-air}}^{\text{inel}}$
- N_{μ} : to $N_{\pi\text{-air}}^{\text{ch}} |_{E \sim \sqrt{E_0}}$

Extensive air shower development

- EAS development – driven by interactions of primary / 'leading' secondary particles
- \Rightarrow **hadronic cascade = EAS backbone**
- secondary cascades – well averaged
- observables used for CR composition studies – most sensitive to hadronic physics
- e.g. X_{max} : to $\sigma_{p\text{-air}}^{\text{inel}}$ and to 'inelasticity' $K_{p\text{-air}}^{\text{inel}}$
- N_{μ} : to $N_{\pi\text{-air}}^{\text{ch}} |_{E \sim \sqrt{E_0}}$

- e.g. X_{max} : to $\sigma_{p\text{-air}}^{\text{inel}}$ and to 'inelasticity' $K_{p\text{-air}}^{\text{inel}}$
- N_{μ} : to $N_{\pi\text{-air}}^{\text{ch}} | E \sim \sqrt{E_0}$

CR composition studies with fluorescence detectors (FD)

- **most sensitive to primary particle interactions** (via X_{\max})
- \Rightarrow suffer from uncertainties of $\sigma_{p\text{-air}}^{\text{inel}}|_{E_0}$, $K_{p\text{-air}}^{\text{inel}}|_{E_0}$
- seeing it optimistic: probe proton-air (nucleus-air) interactions at maximal energies (up to $\sim 10^{21}$ eV)

CR composition studies with fluorescence detectors (FD)

- most sensitive to primary particle interactions (via X_{\max})
- \Rightarrow suffer from uncertainties of $\sigma_{p\text{-air}}^{\text{inel}}|_{E_0}$, $K_{p\text{-air}}^{\text{inel}}|_{E_0}$
- seeing it optimistic: probe proton-air (nucleus-air) interactions at maximal energies (up to $\sim 10^{21}$ eV)

CR composition studies with fluorescence detectors (FD)

- most sensitive to primary particle interactions (via X_{\max})
- \Rightarrow suffer from uncertainties of $\sigma_{p\text{-air}}^{\text{inel}}|_{E_0}$, $K_{p\text{-air}}^{\text{inel}}|_{E_0}$
- seeing it optimistic: probe proton-air (nucleus-air) interactions at maximal energies (up to $\sim 10^{21}$ eV)

Extensive air shower development

CR composition studies with fluorescence detectors (FD)

- most sensitive to primary particle interactions (via X_{\max})

- seeing it optimistic: probe proton-air (nucleus-air) interactions at maximal energies (up to $\sim 10^{21}$ eV)

CR composition studies with ground-based detectors (SD)

- **most sensitive to interactions of secondary pions** (also kaons & (anti-)nucleons) at intermediate energies ($E \sim \sqrt{E_0}$)

Nucleus-induced air showers & superposition model

For average (only!) air shower characteristics: **A –induced EAS of energy E – equivalent to A proton-induced showers of energy E/A**

- N of 'wounded' nucleons per collision: $\langle \nu_A \rangle = A \sigma_{p\text{-air}}^{\text{inel}} / \sigma_{A\text{-air}}^{\text{inel}}$
(valid up to target diffraction)
- nuclear m.f.p. is $\sigma_{p\text{-air}}^{\text{inel}} / \sigma_{A\text{-air}}^{\text{inel}}$ shorter
- however, each nucleon interacts with probability: $w_{\text{int}} = \frac{\sigma_{p\text{-air}}^{\text{inel}}}{\sigma_{A\text{-air}}^{\text{inel}}}$

Nucleus-induced air showers & superposition model

For average (only!) air shower characteristics: A -induced EAS of energy E – equivalent to A proton-induced showers of energy E/A

- N of 'wounded' nucleons per collision: $\langle \nu_A \rangle = A \sigma_{p\text{-air}}^{\text{inel}} / \sigma_{A\text{-air}}^{\text{inel}}$
(valid up to target diffraction)
- nuclear m.f.p. is $\sigma_{p\text{-air}}^{\text{inel}} / \sigma_{A\text{-air}}^{\text{inel}}$ shorter
- however, each nucleon interacts with probability: $w_{\text{int}} = \frac{\sigma_{p\text{-air}}^{\text{inel}}}{\sigma_{A\text{-air}}^{\text{inel}}}$

Nucleus-induced air showers & superposition model

For average (only!) air shower characteristics: A -induced EAS of energy E – equivalent to A proton-induced showers of energy E/A

Nucleus-induced air showers & superposition model

For average (only!) air shower characteristics: A -induced EAS of energy E – equivalent to A proton-induced showers of energy E/A

- N of 'wounded' nucleons per collision: $\langle \nu_A \rangle = A \sigma_{p\text{-air}}^{\text{inel}} / \sigma_{A\text{-air}}^{\text{inel}}$
(valid up to target diffraction)
- nuclear m.f.p. is $\sigma_{p\text{-air}}^{\text{inel}} / \sigma_{A\text{-air}}^{\text{inel}}$ shorter
- however, each nucleon interacts with probability: $w_{\text{int}} = \frac{\sigma_{p\text{-air}}^{\text{inel}}}{\sigma_{A\text{-air}}^{\text{inel}}}$
- $\Rightarrow \langle X_{\text{max}}^A(E) \rangle \simeq \langle X_{\text{max}}^p(E/A) \rangle$; $\langle N_{e/\mu}^A(E) \rangle \simeq A \cdot \langle N_{e/\mu}^p(E/A) \rangle$

Nucleus-induced air showers & superposition model

For average (only!) air shower characteristics: A -induced EAS of energy E – equivalent to A proton-induced showers of energy E/A

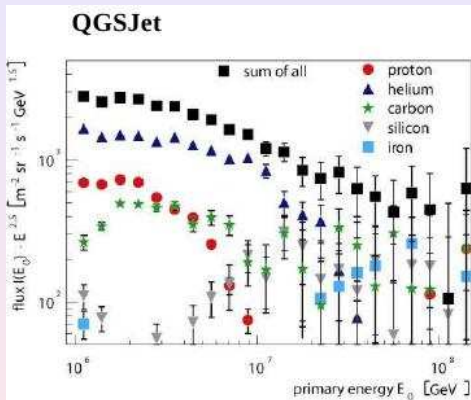

- N of 'wounded' nucleons per collision: $\langle \nu_A \rangle = A \sigma_{p\text{-air}}^{\text{inel}} / \sigma_{A\text{-air}}^{\text{inel}}$
(valid up to target diffraction)
- nuclear m.f.p. is $\sigma_{p\text{-air}}^{\text{inel}} / \sigma_{A\text{-air}}^{\text{inel}}$ shorter
- however, each nucleon interacts with probability: $w_{\text{int}} = \frac{\sigma_{p\text{-air}}^{\text{inel}}}{\sigma_{A\text{-air}}^{\text{inel}}}$
- $\Rightarrow \langle X_{\text{max}}^A(E) \rangle \simeq \langle X_{\text{max}}^p(E/A) \rangle$; $\langle N_{e/\mu}^A(E) \rangle \simeq A \cdot \langle N_{e/\mu}^p(E/A) \rangle$
- $\langle X_{\text{max}}^p(E) \rangle \simeq \text{const} + ER \ln E$, $ER \equiv d\langle X_{\text{max}}^p(E) \rangle / dE$;
 $\langle N_{e/\mu}^p(E/A) \rangle \propto E^{\alpha_{e/\mu}}$, $\alpha_e \simeq 1.1$, $\alpha_\mu \simeq 0.9$

Nucleus-induced air showers & superposition model

For average (only!) air shower characteristics: A -induced EAS of energy E – equivalent to A proton-induced showers of energy E/A

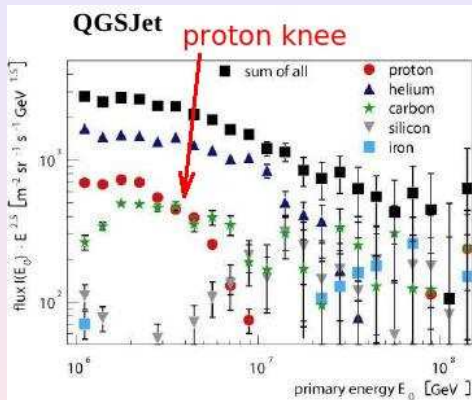

- N of 'wounded' nucleons per collision: $\langle \nu_A \rangle = A \sigma_{p\text{-air}}^{\text{inel}} / \sigma_{A\text{-air}}^{\text{inel}}$ (valid up to target diffraction)
- nuclear m.f.p. is $\sigma_{p\text{-air}}^{\text{inel}} / \sigma_{A\text{-air}}^{\text{inel}}$ shorter
- however, each nucleon interacts with probability: $w_{\text{int}} = \frac{\sigma_{p\text{-air}}^{\text{inel}}}{\sigma_{A\text{-air}}^{\text{inel}}}$
- $\Rightarrow \langle X_{\text{max}}^A(E) \rangle \simeq \langle X_{\text{max}}^p(E/A) \rangle$; $\langle N_{e/\mu}^A(E) \rangle \simeq A \cdot \langle N_{e/\mu}^p(E/A) \rangle$
- $\langle X_{\text{max}}^p(E) \rangle \simeq \text{const} + ER \ln E$, $ER \equiv d\langle X_{\text{max}}^p(E) \rangle / dE$;
 $\langle N_{e/\mu}^p(E/A) \rangle \propto E^{\alpha_{e/\mu}}$, $\alpha_e \simeq 1.1$, $\alpha_\mu \simeq 0.9$
- $\Rightarrow \langle X_{\text{max}}^A(E) \rangle \simeq \langle X_{\text{max}}^p(E) \rangle - ER \ln A$
 $\langle N_e^A(E) \rangle \simeq \langle N_e^p(E) \rangle A^{0.1}$; $\langle N_\mu^A(E) \rangle \simeq \langle N_\mu^p(E) \rangle A^{-0.1}$
– nucleus-induced air showers reach their maxima earlier,
have more e^\pm and less muons

CR composition at the 'knee'

- CR spectra for individual mass groups obtained by the KASCADE Collab. [*Astrop. Phys.* 24(2005)]

CR composition at the 'knee'

- CR spectra for individual mass groups obtained by the KASCADE Collab. [*Astrop. Phys.* 24(2005)]
- partial 'knees' seen for light elements

CR composition at the 'knee'

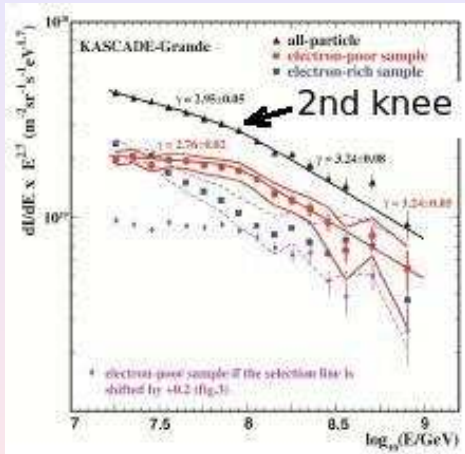

- CR spectra for individual mass groups obtained by the KASCADE Collab. [*Astrop. Phys.* 24(2005)]
- partial 'knees' seen for light elements
- 'knee' positions seem rigidity-dependent

CR composition at the 'knee'

- CR spectra for individual mass groups obtained by the KASCADE Collab. [*Astrop. Phys.* 24(2005)]
- partial 'knees' seen for light elements
- 'knee' positions seem rigidity-dependent
- situation with heavier CRs – unclear

CR composition at the 'knee'

- 2nd 'knee' observed recently at 10^{17} eV by KASCADE-Grande [PRL (2011) in press]

CR composition at the 'knee'

- 2nd 'knee' observed recently at 10^{17} eV by KASCADE-Grande [PRL (2011) in press]
- caused by a spectral break for heavy CRs (*Fe*)

CR composition at the 'knee'

- 2nd 'knee' observed recently at 10^{17} eV by KASCADE-Grande [PRL (2011) in press]
- caused by a spectral break for heavy CRs (*Fe*)
- **astrophysical** (rigidity-dependent) origin of the CR 'knee' finally confirmed

UHECR composition from X_{\max} observations

EAS maximum position X_{\max} – the key to the UHECR composition

UHECR composition from X_{\max} observations

EAS maximum position X_{\max} – the key to the UHECR composition

- spectacular results from HiRes Collab. [*PRL (2005)*; *PRL (2010)*]: *p-dominated composition above 10^{18} eV*
- strong support for the 'dip' model: transition from galactic *Fe* to extragalactic *p* component at 10^{17} eV

UHECR composition from X_{\max} observations

EAS maximum position X_{\max} – the key to the UHECR composition

- spectacular results from HiRes Collab. [*PRL (2005)*; *PRL (2010)*]: *p*-dominated composition above 10^{18} eV
- strong support for the 'dip' model: transition from galactic *Fe* to extragalactic *p* component at 10^{17} eV

UHECR composition from X_{\max} observations

EAS maximum position X_{\max} – the key to the UHECR composition

- spectacular results from HiRes Collab. [*PRL (2005)*; *PRL (2010)*]: p -dominated composition above 10^{18} eV
- supported by data of Telescope Array Collab. [*Tameda, ICRC-2011*]

UHECR composition from X_{\max} observations

EAS maximum position X_{\max} – the key to the UHECR composition

- Pierre Auger Collab.:
change from light to heavy
CRs above 10^{19} eV
[PRL (2010); Facal San
Luis, ICRC-2011]
- interpretation of data –
strongly model-dependent!

UHECR composition from X_{\max} observations

EAS maximum position X_{\max} – the key to the UHECR composition

- Pierre Auger Collab.: change from light to heavy CRs above 10¹⁹ eV [PRL (2010); Facal San Luis, ICRC-2011]
- interpretation of data – strongly model-dependent!

UHECR composition from X_{\max} observations

EAS maximum position X_{\max} – the key to the UHECR composition

- Pierre Auger Collab.: change from light to heavy CRs above 10^{19} eV [PRL (2010); Facal San Luis, ICRC-2011]
- interpretation of data – strongly model-dependent!
- is it possible to reduce model-dependence?!

UHECR composition from X_{\max} observations

EAS maximum position X_{\max} – the key to the UHECR composition

- Pierre Auger Collab.: change from light to heavy CRs above 10^{19} eV [PRL (2010); Facal San Luis, ICRC-2011]
- interpretation of data – strongly model-dependent!
- is it possible to reduce model-dependence?!

- yes, by studying shower fluctuations, e.g. $RMS(X_{\max})$ [Aloisio, Berezhinsky, Blasi & SO, PRD 77 (2008)]

UHECR composition from $\text{RMS}(X_{\text{max}})$

- $\text{RMS}(X_{\text{max}})$ measured by the Pierre Auger Collab. [PRL (2010); Facal San Luis, ICRC-2011]
- model-dependence strongly reduced
- but: almost pure Fe at the highest energies?!

UHECR composition from $\text{RMS}(X_{\text{max}})$

- $\text{RMS}(X_{\text{max}})$ measured by the Pierre Auger Collab. [*PRL (2010); Facal San Luis, ICRC-2011*]
- model-dependence strongly reduced
- but: almost pure *Fe* at the highest energies?!

UHECR composition from $\text{RMS}(X_{\text{max}})$

- $\text{RMS}(X_{\text{max}})$ measured by the Pierre Auger Collab. [*PRL (2010); Facal San Luis, ICRC-2011*]
- model-dependence strongly reduced
- but: almost pure *Fe* at the highest energies?!

UHECR composition from muon component?

Alternative approach – study of muon densities at ground

UHECR composition from muon component?

Alternative approach – study of muon densities at ground

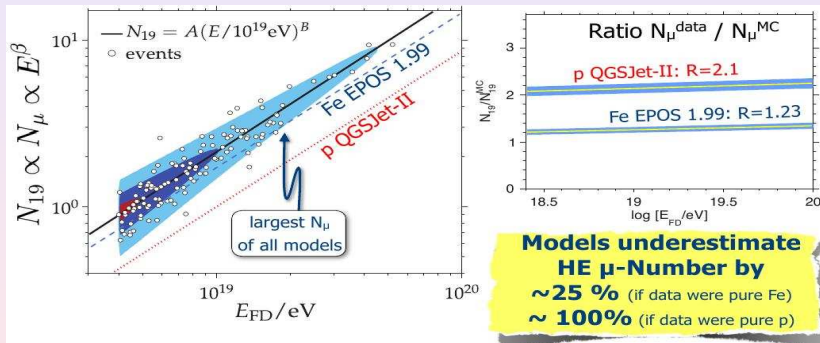

- Pierre Auger Collab.: **strong muon excess observed compared to model predictions!** [Rodriguez, ICRC-2011]

UHECR composition from muon component?

Alternative approach – study of muon densities at ground

- Pierre Auger Collab.: strong muon excess observed compared to model predictions! [Rodriguez, ICRC-2011]

- may be UHECR are gold nuclei?!

UHECR composition from muon component?

Alternative approach – study of muon densities at ground

- Pierre Auger Collab.: strong muon excess observed compared to model predictions! [Rodriguez, ICRC-2011]

- may be UHECR are gold nuclei?!
- highly unlikely, rather CR interaction models should be wrong

CR interaction models

- similar physics content for all MC generators used in CR field:
 - multiple scattering
 - soft & hard processes
 - nonlinear effects, e.g. parton shadowing (not in all models)

CR interaction models

- similar physics content for all MC generators used in CR field:
 - multiple scattering
 - soft & hard processes
 - nonlinear effects, e.g. parton shadowing (not in all models)

CR interaction models

- similar physics content for all MC generators used in CR field:
 - multiple scattering
 - **soft & hard processes**
 - nonlinear effects, e.g. parton shadowing (not in all models)

CR interaction models

- similar physics content for all MC generators used in CR field:
 - multiple scattering
 - soft & hard processes
 - nonlinear effects, e.g. parton shadowing (not in all models)

CR interaction models

- similar physics content for all MC generators used in CR field:
 - multiple scattering
 - soft & hard processes
 - nonlinear effects, e.g. parton shadowing (not in all models)
- **representative models:**
 - QGSJET (Kalmykov & SO, 1993–1997)
 - SIBYLL 1.7/2.1 (Ahn, Engel, Gaisser, Lipari & Stanev, 1994/1999)
 - QGSJET II-03/04 (SO, 2006/2011)
 - EPOS (Liu, Pierog & Werner, 2006-2011)

CR interaction models

 - EPOS (Liu, Pierog & Werner, 2006-2011)
- all the models based on similar ideas / qualitative approaches
- differ in implementations, theory input, etc. \Rightarrow in predictions
- **model updates / cross checks with new data** ← necessary →

MC generators & LHC data

- LHC data: $N_{ch}(s)$ rises quicker than predicted by most MCs

[plots from d'Enterria et al., *Astrop. Phys.* 35 (2011)]

MC generators & LHC data

- $N_{\text{ch}}(s)$ - described better by CR interaction models

[plots from *d'Enterria et al., Astrop. Phys. 35 (2011)*]

MC generators & LHC data

- $N_{\text{ch}}(s)$ - described better by CR interaction models

[plots from *d'Enterria et al., Astrop. Phys. 35 (2011)*]

- most of the models agree with the data within 10% (surprisingly, the oldest models perform best)

MC generators & LHC data

- $N_{\text{ch}}(s)$ - described better by CR interaction models

[plots from *d'Enterria et al., Astrop. Phys. 35 (2011)*]

- most of the models agree with the data within 10% (surprisingly, the oldest models perform best)
- CR MCs: **tuned to data over a wide energy range**
⇒ loose in details, win in predictive power

MC generators & LHC data

- $N_{\text{ch}}(s)$ - described better by CR interaction models

[plots from *d'Enterria et al., Astrop. Phys. 35 (2011)*]

- most of the models agree with the data within 10% (surprisingly, the oldest models perform best)
- CR MCs: tuned to data over a wide energy range \Rightarrow loose in details, win in predictive power
- however: **none of the models describes all the observables**

MC generators & LHC data

- $N_{\text{ch}}(s)$ - described better by CR interaction models

[plots from d'Enterria et al., *Astrop. Phys.* 35 (2011)]

- however: none of the models describes all the observables

Effect of model retuning to LHC data?

- in the following investigated using the QGSJET-II model

Multiplicity adjustment

- $N_{\text{ch}}(s)$ -rise: **too steep in QGSJET-II-03**

Multiplicity adjustment

- $N_{\text{ch}}(s)$ -rise: too steep in QGSJET-II-03

not easy to correct:

- hadronization parameters – tuned at fixed target energies
- general model parameters – tuned to cross sections & SFs

Multiplicity adjustment

- $N_{\text{ch}}(s)$ -rise: too steep in QGSJET-II-03

not easy to correct:

- hadronization parameters – tuned at fixed target energies
- general model parameters – **tuned to cross sections & SFs**

Multiplicity adjustment

changing the cutoff Q_0^2 between soft & hard processes
($2.5 \rightarrow 3 \text{ GeV}^2$)

- parton saturation operates over a larger kinematic space
- \Rightarrow slows down multiplicity rise

Multiplicity adjustment

changing the cutoff Q_0^2 between soft & hard processes
($2.5 \rightarrow 3 \text{ GeV}^2$)

- parton saturation operates over a larger kinematic space
- \Rightarrow slows down multiplicity rise

Multiplicity adjustment

changing the cutoff Q_0^2 between soft & hard processes
($2.5 \rightarrow 3 \text{ GeV}^2$)

- parton saturation operates over a larger kinematic space
- \Rightarrow slows down multiplicity rise

Multiplicity: cross check with ATLAS data

$dN_{\text{ch}}/d\eta$: model-independent results from ATLAS

- qualitatively the same trend
- the level of (dis)agreement varies for different event selections

Multiplicity: cross check with ATLAS data

$dN_{\text{ch}}/d\eta$: model-independent results from ATLAS

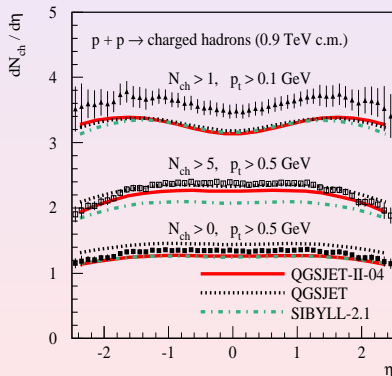

- qualitatively the same trend
- the level of (dis)agreement **varies for different event selections**

Multiplicity: cross check with ATLAS data

$dN_{\text{ch}}/d\eta$: model-independent results from ATLAS:

- overall multiplicity corrections at $\sim 10\%$ level
- \Rightarrow insignificant for air shower predictions

Multiplicity: cross check with ATLAS data

$dN_{\text{ch}}/d\eta$: model-independent results from ATLAS:

- overall multiplicity corrections at $\sim 10\%$ level
- \Rightarrow insignificant for air shower predictions

Production of (anti-)baryons

Generally, enhanced production of (anti-)baryons may increase EAS muon content [*Pierog & Werner, PRL (2008)*]

- more energy kept in the hadronic cascade
- more cascade steps (no decay for nucleons) \Rightarrow higher N_μ

Production of (anti-)baryons

Generally, enhanced production of (anti-)baryons may increase EAS muon content [*Pierog & Werner, PRL (2008)*]

- more energy kept in the hadronic cascade
- **more cascade steps** (no decay for nucleons) \Rightarrow higher N_μ

Production of (anti-)baryons

Generally, enhanced production of (anti-)baryons may increase EAS muon content [*Pierog & Werner, PRL (2008)*]

- more energy kept in the hadronic cascade
- more cascade steps (no decay for nucleons) \Rightarrow higher N_μ

- \bar{p} -production at LHC:
no excess compared to most model predictions
- \Rightarrow no corrections for N_μ

Production of (anti-)baryons

Generally, enhanced production of (anti-)baryons may increase EAS muon content [*Pierog & Werner, PRL (2008)*]

- more energy kept in the hadronic cascade
- more cascade steps (no decay for nucleons) \Rightarrow higher N_μ

- \bar{p} -production at LHC: no excess compared to most model predictions

• \Rightarrow no corrections for N_μ

Production of strange particles

Enhancement of strange particle production may also increase N_μ

- more energy channeled into hadronic cascade
- QGSJET-II-03: noticeable correction required by LHC data

Production of strange particles

Enhancement of strange particle production may also increase N_μ

- more energy channeled into hadronic cascade
- QGSJET-II-03: noticeable correction required by LHC data

Production of strange particles

Enhancement of strange particle production may also increase N_μ

- more energy channeled into hadronic cascade
- QGSJET-II-03: noticeable correction required by LHC data
- **higher kaon yields in older models** (QGSJET, SIBYLL)

Inelastic cross section

- side-effect of higher Q_0^2 -cutoff: slower rise of cross sections
- e.g., σ_{pp}^{tot} - consistent with E710 data at 1.8 TeV

Inelastic cross section

- side-effect of higher Q_0^2 -cutoff: slower rise of cross sections
- e.g., σ_{pp}^{tot} - consistent with E710 data at 1.8 TeV

Inelastic cross section

- side-effect of higher Q_0^2 -cutoff: slower rise of cross sections
- e.g., σ_{pp}^{tot} - consistent with E710 data at 1.8 TeV
- lower cross sections now supported by LHC data

	QGSJET-II-04	QGSJET-II-03	SIBYLL	ATLAS
MBTS _{AND}	54.1	62.3	68.4	51.9 ± 5.7
MBTS _{OR}	60.8	69.8	74.7	58.7 ± 6.5

Table: Model predictions for “visible” cross sections (in mb) at $\sqrt{s} = 7$ TeV for ATLAS MB triggers: at least one charged hadron at $-3.84 < \eta < -2.09$ and/or at $2.09 < \eta < 3.84$ (MBTS_{AND/OR}):

Inelastic cross section

Similar results by ALICE & CMS:

	QGSJET-II-04	QGSJET-II-03	SIBYLL	ALICE
2.76 TeV	47.4	52.5	56.2	47.2 ± 3.3
7 TeV	55.1	63.6	69.1	54.2 ± 3.8

Comparison with Models and Extrapolation to σ_{inel} (pp)

Proton-air cross section & X_{\max}

- reduction of $\sigma_{pp}^{\text{inel}}$
 \Rightarrow slower energy-rise of proton-air cross section
- deeper shower penetration

Proton-air cross section & X_{\max}

- reduction of $\sigma_{pp}^{\text{inel}}$
 \Rightarrow slower energy-rise of
proton-air cross section
- deeper shower penetration

Proton-air cross section & X_{\max}

- elongation rate (ER) reduced above 1 EeV
- NB: similarity between QGSJET-II-04 and SIBYLL - misleading (ER-increase will be even larger there)

Proton-air cross section & X_{\max}

- elongation rate (ER) reduced above 1 EeV
- NB: similarity between QGSJET-II-04 and SIBYLL - misleading (ER-increase will be even larger there)
- however: **inelasticity-related uncertainty remains**

Proton-air cross section & X_{\max}

- elongation rate (ER) reduced above 1 EeV
- NB: similarity between QGSJET-II-04 and SIBYLL - misleading (ER-increase will be even larger there)
- however: inelasticity-related uncertainty remains
- QGSJET/QGSJET-II-04: large X_{\max} difference

Impact on CR composition studies

- overall effect of the retuning on air shower predictions:
 - less than 10% change for muon number (N_μ)
 - shower maximum X_{\max} shifted deeper above 10^{18} eV (by less than 20 g/cm^2 at 10^{20} eV)

Impact on CR composition studies

- overall effect of the retuning on air shower predictions:
 - less than 10% change for muon number (N_μ)
 - shower maximum X_{\max} shifted deeper above 10^{18} eV (by less than 20 g/cm^2 at 10^{20} eV)

Impact on CR composition studies

- overall effect of the retuning on air shower predictions:
 - less than 10% change for muon number (N_μ)
 - shower maximum X_{\max} shifted deeper **above 10^{18} eV**
(by less than 20 g/cm² at 10^{20} eV)

Impact on CR composition studies

- overall effect of the retuning on air shower predictions:
 - less than 10% change for muon number (N_μ)
 - shower maximum X_{\max} shifted deeper above 10^{18} eV (by less than 20 g/cm^2 at 10^{20} eV)
- good news for KASCADE(-Grande):
 - hadronic physics at & around the 'knee' – robust

Impact on CR composition studies

- overall effect of the retuning on air shower predictions:
 - less than 10% change for muon number (N_μ)
 - shower maximum X_{\max} shifted deeper above 10^{18} eV (by less than 20 g/cm^2 at 10^{20} eV)
- good news for KASCADE(-Grande):
 - hadronic physics at & around the 'knee' – robust

Impact on CR composition studies

- overall effect of the retuning on air shower predictions:

 - however: results depend strongly on hadronic MC models
- 3 first lessons from LHC data:
 - CR interaction models behave reasonably well
 - only cosmetic corrections seem to be needed
 - exception: **reduction of $\sigma_{pp}^{\text{inel}}$ required** (for most of the models)

Summary

- 1 considerable progress in studying (ultra-)high energy CRs
 - astrophysical origin of the CR 'knee' established
 - high energy (GZK?) cutoff firmly confirmed
 - first hints towards astrophysical sources of UHECR
- 2 decisive tool – measurements of CR composition
 - however: results depend strongly on hadronic MC models
- 3 first lessons from LHC data:
 - CR interaction models behave reasonably well
 - only cosmetic corrections seem to be needed
 - exception: reduction of $\sigma_{pp}^{\text{inel}}$ required (for most of the models)
- 4 **impact on experimental CR studies:**
 - astrophysical origin of the CR 'knee' – supported by LHC data (no exotic physics observed at mb level)
 - UHECR composition puzzle – further aggravated: small room to explain the 'muon excess', X_{max} / $\text{RMS}(X_{\text{max}})$ inconsistencies

Summary

- 1 expected/desirable theoretical progress:
 - reliable QCD treatment of 'dense' parton systems
⇒ of $N_{\text{ch}}(s)$ ⇒ muon content of air showers
 - good understanding of 'baryon stopping' mechanism ⇒ of X_{max}

- 1 expected/desirable theoretical progress:
 - reliable QCD treatment of 'dense' parton systems
⇒ of $N_{\text{ch}}(s)$ ⇒ muon content of air showers
 - good understanding of 'baryon stopping' mechanism ⇒ of X_{max}

- 1 expected/desirable theoretical progress:
 - reliable QCD treatment of 'dense' parton systems
⇒ of $N_{\text{ch}}(s)$ ⇒ muon content of air showers
 - **good understanding of 'baryon stopping' mechanism** ⇒ of X_{max}

- 1 expected/desirable theoretical progress:
 - reliable QCD treatment of 'dense' parton systems
⇒ of $N_{\text{ch}}(s)$ ⇒ muon content of air showers
 - good understanding of 'baryon stopping' mechanism ⇒ of X_{max}
- 2 expected/desirable input from LHC:
 - measurements of total & diffractive cross sections by TOTEM
⇒ reliable understanding of $\text{RMS}(X_{\text{max}})$
 - studies of 'baryon stopping' by LHCf ⇒ understanding of X_{max}
 - just an unrealistic dream: pion-proton collisions at LHC?

- 1 expected/desirable theoretical progress:
 - reliable QCD treatment of 'dense' parton systems

Backup

UHECR composition from $RMS(X_{\max})$?

- $RMS(X_{\max})$ for proton-induced showers
 - mainly dominated by m.f.p. $\lambda_p \propto 1/\sigma_{p\text{-air}}^{\text{inel}}$
 - also sensitive to the collision geometry: large 'stopping power' (K_{inel}) for small b , small K_{inel} for large b

UHECR composition from $\text{RMS}(X_{\text{max}})$?

- $\text{RMS}(X_{\text{max}})$ for proton-induced showers
 - mainly dominated by m.f.p. $\lambda_p \propto 1/\sigma_{p\text{-air}}^{\text{inel}}$
 - also sensitive to the collision geometry: large 'stopping power' (K_{inel}) for small b , small K_{inel} for large b

UHECR composition from $RMS(X_{\max})$?

- $RMS(X_{\max})$ for proton-induced showers
 - mainly dominated by m.f.p. $\lambda_p \propto 1/\sigma_{p\text{-air}}^{\text{inel}}$
 - **also sensitive to the collision geometry:** large 'stopping power' (K_{inel}) for small b , small K_{inel} for large b

UHECR composition from $\text{RMS}(X_{\text{max}})$?

- $\text{RMS}(X_{\text{max}})$ for proton-induced showers
 - mainly dominated by m.f.p. $\lambda_p \propto 1/\sigma_{p\text{-air}}^{\text{inel}}$
 - also sensitive to the collision geometry: large 'stopping power' (K_{inel}) for small b , small K_{inel} for large b
- $\text{RMS}(X_{\text{max}})$ for nucleus-induced showers
 - mainly dominated by the collision geometry: (more 'participants' for central collisions)
 - sensitive to nuclear fragmentation (up to factor of 2 difference for $\text{RMS}(X_{\text{max}})$ [*Kalmykov & SO, Phys. At. Nucl. 56 (1993)*])
 - NB: superposition model inapplicable

UHECR composition from $\text{RMS}(X_{\text{max}})$?

- $\text{RMS}(X_{\text{max}})$ for proton-induced showers
 - mainly dominated by m.f.p. $\lambda_p \propto 1/\sigma_{p\text{-air}}^{\text{inel}}$

QGSJET-II model

- based on combined treatment of **soft & hard parton processes**

- soft processes ($q^2 < Q_0^2$):
'soft Pomeron'
- hard processes ($q^2 > Q_0^2$):
DGLAP formalism
- taken together:
'semihard Pomeron'

QGSJET-II model

- based on combined treatment of soft & hard parton processes

- soft processes ($q^2 < Q_0^2$):
'soft Pomeron'
- hard processes ($q^2 > Q_0^2$):
DGLAP formalism
- taken together:
'semihard Pomeron'

QGSJET-II model

- based on combined treatment of soft & hard parton processes

- soft processes ($q^2 < Q_0^2$):
'soft Pomeron'
- hard processes ($q^2 > Q_0^2$):
DGLAP formalism
- taken together:
'semihard Pomeron'

QGSJET-II model

- based on combined treatment of soft & hard parton processes

- soft processes ($q^2 < Q_0^2$):
'soft Pomeron'
- hard processes ($q^2 > Q_0^2$):
DGLAP formalism
- taken together:
'semihard Pomeron'

QGSJET-II model

- based on combined treatment of soft & hard parton processes

- soft processes ($q^2 < Q_0^2$):
'soft Pomeron'

- hard processes ($q^2 > Q_0^2$):
DGLAP formalism

- taken together:
'semihard Pomeron'

- nonlinear processes (parton shadowing / saturation):
Pomeron-Pomeron interactions

- based on combined treatment of soft & hard parton processes

- soft processes ($q^2 < Q_0^2$):
'soft Pomeron'
- hard processes ($q^2 > Q_0^2$):
DGLAP formalism
- taken together:
'semihard Pomeron'

- nonlinear processes (parton shadowing / saturation):
Pomeron-Pomeron interactions

- NB: in this model **saturation may be reached for soft**
($q^2 < Q_0^2$) partons only

New version of QGSJET-II (QGSJET-II-04)

- QGSJET-II-03: only dominant ('net-like') Pomeron-Pomeron interactions

New version of QGSJET-II (QGSJET-II-04)

- QGSJET-II-03: only dominant ('net-like') Pomeron-Pomeron interactions

- QGSJET-II-04: also 'Pomeron loops' included
- small at low parton density
- suppressed at high density
- still a finite correction at large b
 \Rightarrow influence cross sections & particle production

New version of QGSJET-II (QGSJET-II-04)

- QGSJET-II-03: only dominant ('net-like') Pomeron-Pomeron interactions
- QGSJET-II-04: also 'Pomeron loops' included
- **small at low parton density**
- suppressed at high density
- still a finite correction at large b
 \Rightarrow influence cross sections & particle production

New version of QGSJET-II (QGSJET-II-04)

- QGSJET-II-03: only dominant ('net-like') Pomeron-Pomeron interactions
- QGSJET-II-04: also 'Pomeron loops' included
- small at low parton density
- **suppressed at high density**
- still a finite correction at large b
 \Rightarrow influence cross sections & particle production

New version of QGSJET-II (QGSJET-II-04)

- QGSJET-II-03: only dominant ('net-like') Pomeron-Pomeron interactions

- QGSJET-II-04: also 'Pomeron loops' included
- small at low parton density
- suppressed at high density
- **still a finite correction at large b**
⇒ influence cross sections & particle production

New version of QGSJET-II (QGSJET-II-04)

- QGSJET-II-03: only dominant ('net-like') Pomeron-Pomeron interactions

- QGSJET-II-04: also 'Pomeron loops' included
- small at low parton density
- suppressed at high density
- still a finite correction at large b
⇒ influence cross sections & particle production

- however: small impact on EAS characteristics
if the model is calibrated to the same data set [SO, 2009]

New version of QGSJET-II (QGSJET-II-04)

 \Rightarrow influence cross sections & particle production

- however: small impact on EAS characteristics if the model is calibrated to the same data set [SO, 2009]

- discussed above: **impact of calibration to LHC data**

UHECR composition?

- PAO data on $\text{RMS}(X_{\text{max}})$:
heavy-dominated
composition at 1 EeV!

UHECR composition?

- PAO data on $\text{RMS}(X_{\text{max}})$: heavy-dominated composition at 1 EeV!
- indeed, consider 2 cases for 2-component composition): change from pure p to Fe at $E_0 = 1 \div 30$ EeV, or from a mixture (60% Fe and 40% p at 1 EeV)

UHECR composition?

- PAO data on $\text{RMS}(X_{\text{max}})$: heavy-dominated composition at 1 EeV!
- indeed, consider 2 cases for 2-component composition): change from pure p to Fe at $E_0 = 1 \div 30$ EeV, or from a mixture (60% Fe and 40% p at 1 EeV)
- 2nd option supported by the data
