and Research

- Gauge mediated SUSY breaking (GMSB)
 - Messenger fields couple to sparticles through gauge interaction
 - Very light **Gravitino: LSP**
- General gauge mediation (GGM) *P. Meade, N. Seiberg, D. Shih, arXiv:0801.3278v3*
 - Neutralino **NLSP** mixture of **Bino**, Wino, Higgsino

Signatures with **photons + MET**

- Experimental results (CMS):
 - $\gamma + \text{jets} + \text{MET}$
 - $\gamma + \gamma + \text{MET}$
 - $\gamma + \text{lepton} + \text{MET}$
- } 1.14/fb
 } 35/pb

Neutralino NLSP mixture of Bino, Wino, Higgsino, e.g.:

- Bino-like NLSP

$$\chi_1^0 \rightarrow \gamma + G \quad \text{or} \quad \chi_1^0 \rightarrow Z^0 + G$$

- Wino-like (co-)NLSP:

$$\chi_1^0 \rightarrow \gamma + G \quad \text{or} \quad \chi_1^0 \rightarrow Z^0 + G$$

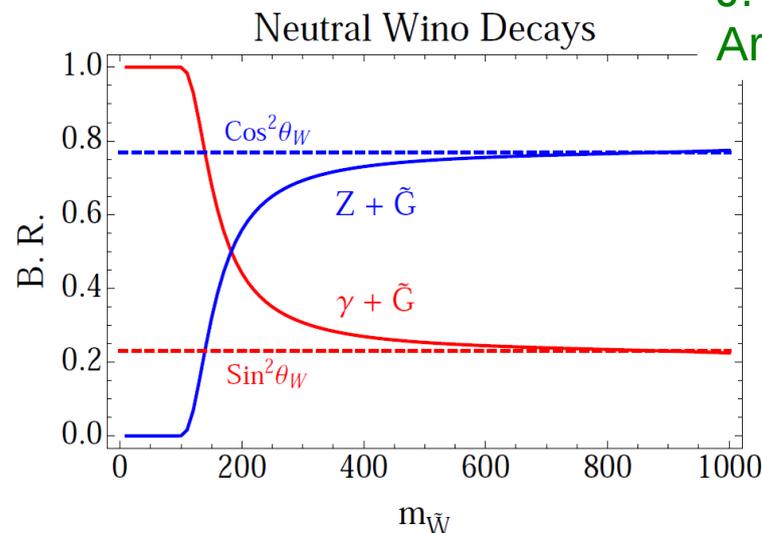

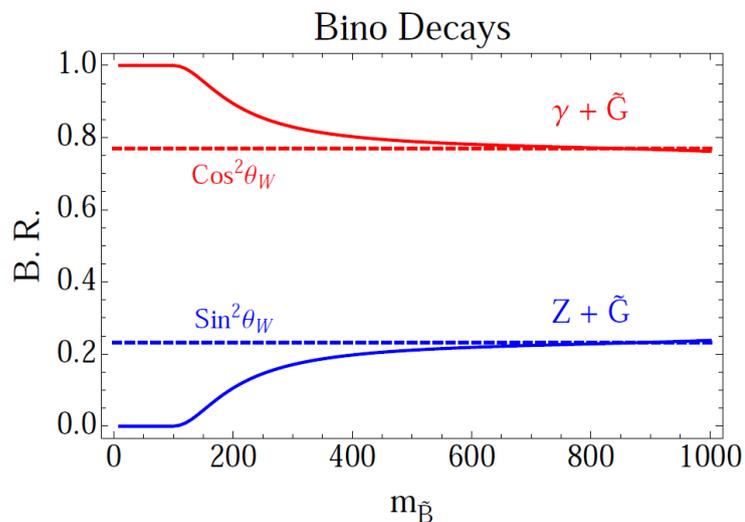

$$\text{or} \quad \chi_1^\mp \rightarrow W^\mp + \text{Gravitino}$$

- Bino-Higgsino-like NLSP

$$\chi_1^0 \rightarrow \gamma + G \quad \text{or} \quad \chi_1^0 \rightarrow Z^0 + G$$

$$\text{or} \quad \chi_1^0 \rightarrow h + G$$

- R-parity conserved:
two NLSP's per event

J. Ruderman, D. Shih
ArXiv:1103.6083v1

Estimation of Standard Model backgrounds

Analysis	Fake photons - QCD (jets)	Fake photons - EWK (electrons)	Irreducible (photons)
$\gamma + \text{jets} + \text{MET}$	$\gamma + \text{jet}$ $j \rightarrow \gamma$		
$\gamma + \gamma + \text{MET}$	$\gamma + \text{jet}$ $j \rightarrow \gamma$		
$\gamma + l + \text{MET}$	$j \rightarrow \text{lepton}$		

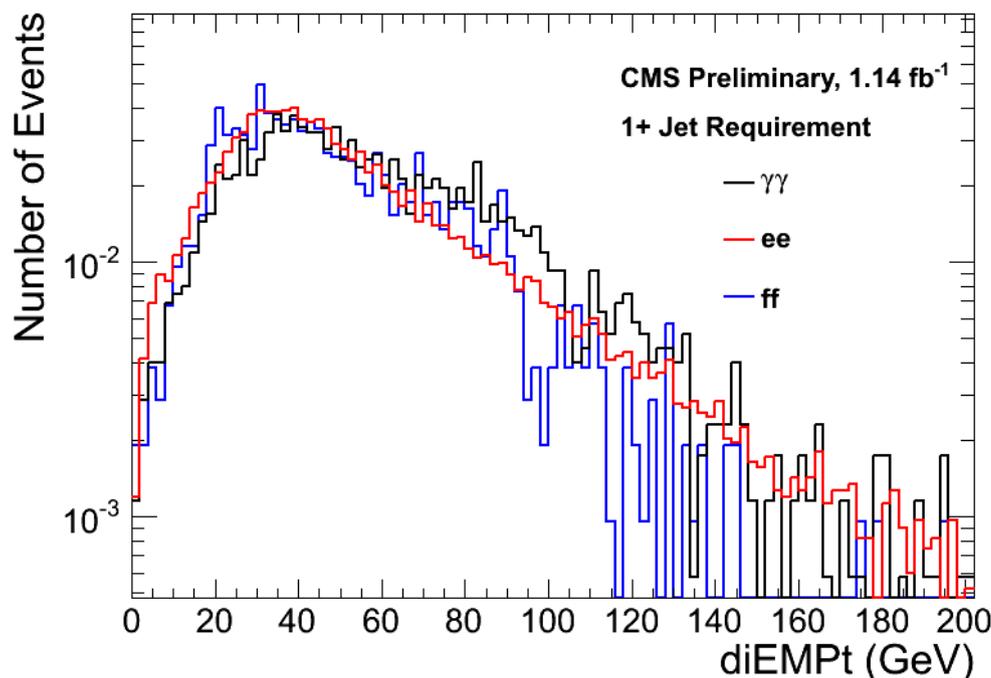

main background
 subdominant
 negligible

data driven
 estimates

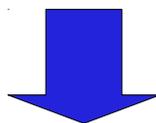

- Mostly no intrinsic MET ➔ MET due to jet mismeasurement
 - 1) Select control sample(s) in data: electrons or 'fake' leptons/photons
 - similar selection, but e.g. looser isolation
 - 2) Reweight control sample to match p_T distribution of candidate sample
 - 3) Normalize distributions in low MET region
(no signal contribution expected)

- $\gamma\gamma$ +jet+MET:
- Control sample
 - Di-electron & di-fake
 - normalized MET < 20 GeV

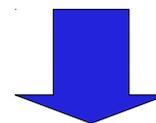

Analysis	Fake photons - QCD (jets)	Fake photons - EWK (electrons)	Irreducible (photons)
$\gamma + \text{jets} + \text{MET}$	$\gamma + \text{jet}$ $j \rightarrow \gamma$	W, top ($e \rightarrow \gamma$)	
$\gamma + \gamma + \text{MET}$	$\gamma + \text{jet}$ $j \rightarrow \gamma$	W+ γ , W+jet ($e \rightarrow \gamma, j \rightarrow \gamma$)	
$\gamma + l + \text{MET}$	$j \rightarrow \text{lepton}$	DY, WW, top ($e \rightarrow \gamma$) W+jet ($j \rightarrow \gamma$)	

main background
subdominant
negligible

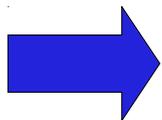

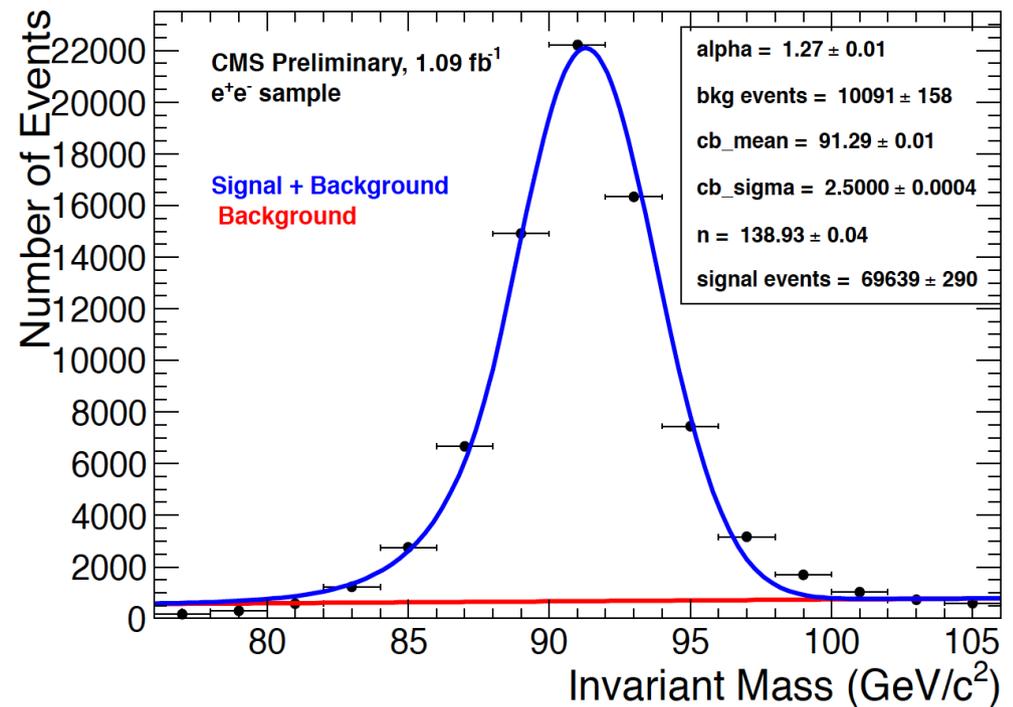

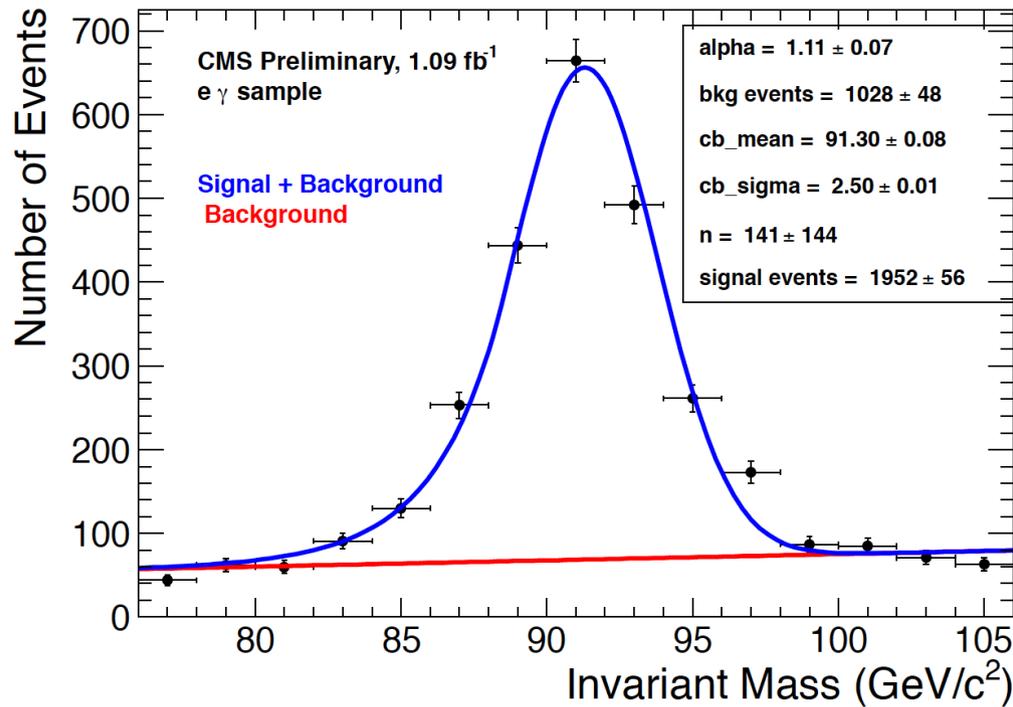

data driven
estimates

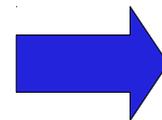

data driven
estimates

- Use $Z \rightarrow ee$ events (ratio $ee/e\gamma$) to derive fake rate

Used by all presented analyses

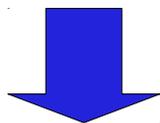

Fakerate $f_{e \rightarrow \gamma} = 0.014 \pm 0.002$
 ± 0.0004

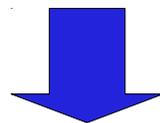

Estimate EWK background with
electron sample measured in data:
Reweight with $f_{e \rightarrow \gamma}$

Results & Interpretation

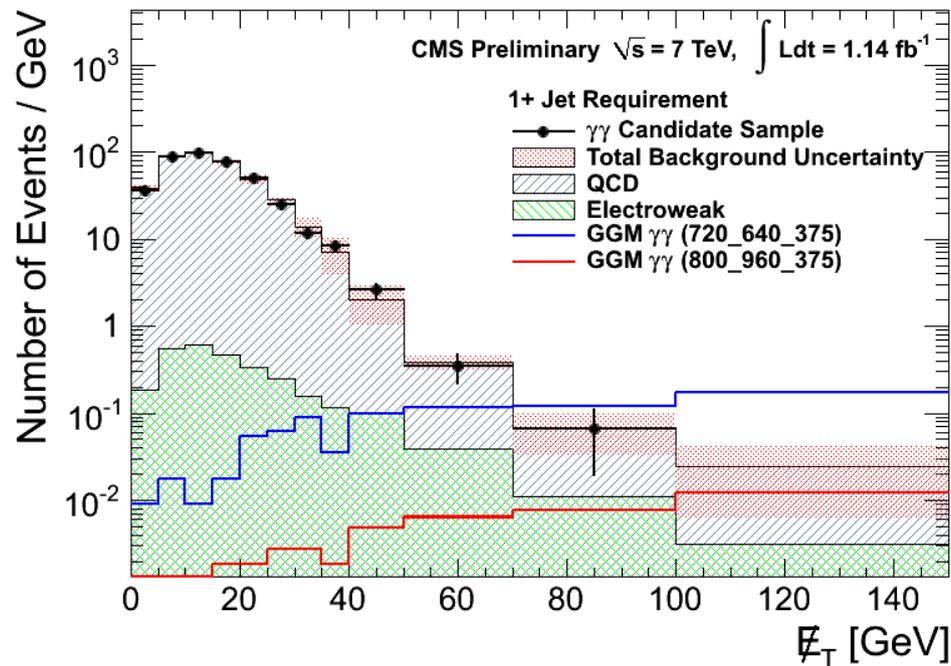

$\gamma + \text{jet} + \text{MET}, 1.1/\text{fb}$

No excess over
SM expectation observed

Signal region: $\text{MET} > 200 \text{ GeV}$

Sample	Event yield		
		(stat.)	(syst.)
Data	7		
QCD (est. from data)	5.16	± 2.58	± 0.62
EWK $e \rightarrow \gamma$ (est. from data)	1.22	± 0.13	± 0.04
FSR/ISR ($W \rightarrow \mu/\tau\nu, Z \rightarrow \nu\nu$) (Sim.)	0.80	± 0.31	± 0.80
FSR/ISR ($t\bar{t} \rightarrow \mu/\tau\nu + X$) (Sim.)	0.07	± 0.05	± 0.07
Total SM background estimate	7.24	± 2.6	± 1.53

$\gamma\gamma$ +jet+MET, 1.1/fb

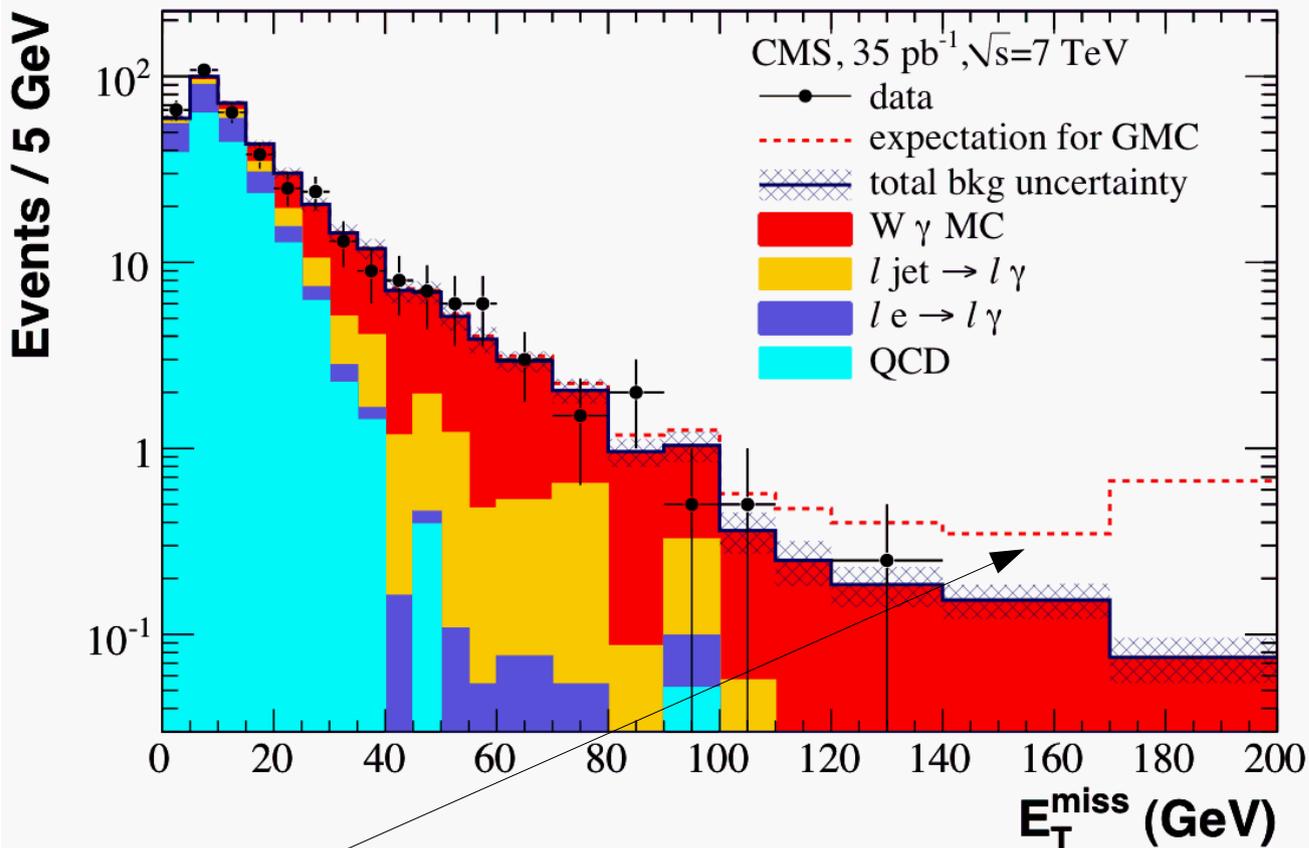

No excess over
SM expectation observed

Signal region: MET > 100 GeV

Type	Events	stat. error	scal. error	norm. error
$\gamma\gamma$ candidates	0			
ff QCD background	2.3 ± 2.2	± 2.19	± 0.13	± 0.10
ee QCD background	1.0 ± 0.8	± 0.82	± 0.02	± 0.03
EWK background	0.3 ± 0.1	± 0.06	± 0.0	± 0.03
Total background (ff)	2.5 ± 2.2			
Total background (ee)	1.3 ± 0.8			

γ + l + MET, 35/pb

- No excess over SM expectation observed
- Combination of $e\gamma$ & $\mu\gamma$
- Signal region: MET > 100 GeV
 - Observed: 2
 - Expected: 3.3 +/- 0.8

GMC: sample point (wino-like NLSP)

- $m_{\text{squark}} \sim m_{\text{gluino}} = 450$ GeV

- $m_{\text{neutralino/chargedino}} = 195$ GeV

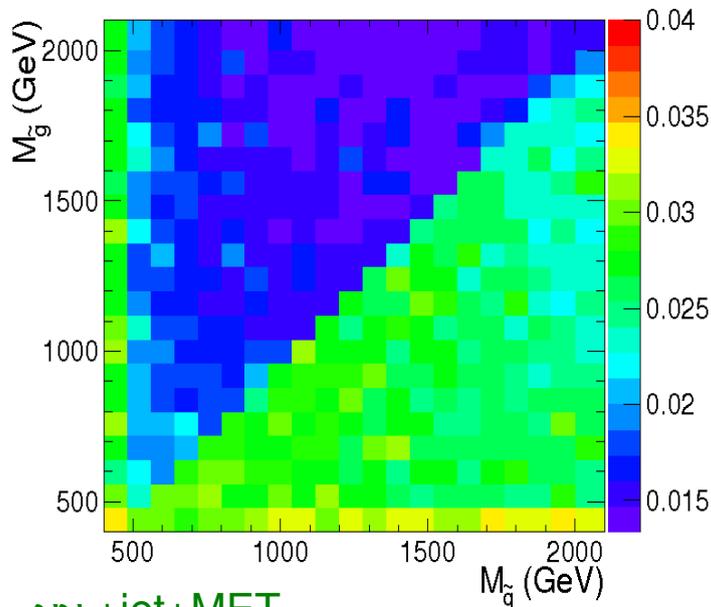

- $\tan \beta = 2$

- Photon efficiency Data/MC: 0.953 ± 0.068
 - Includes error on PU
- Systematic uncertainty on acceptance:
 - JES 2%
 - PDF uncertainty: 0.1-9 %
- PDF uncertainty on XS: 4-66%
- CLs limit with likelihood-ratio test-statistics at 95%CL
- Lumi = $1.14/\text{fb} \pm 4.5\%$ error
- GGM signal MC

γ +jet+MET/ $\gamma\gamma$ +jet+MET

XS
upper limits

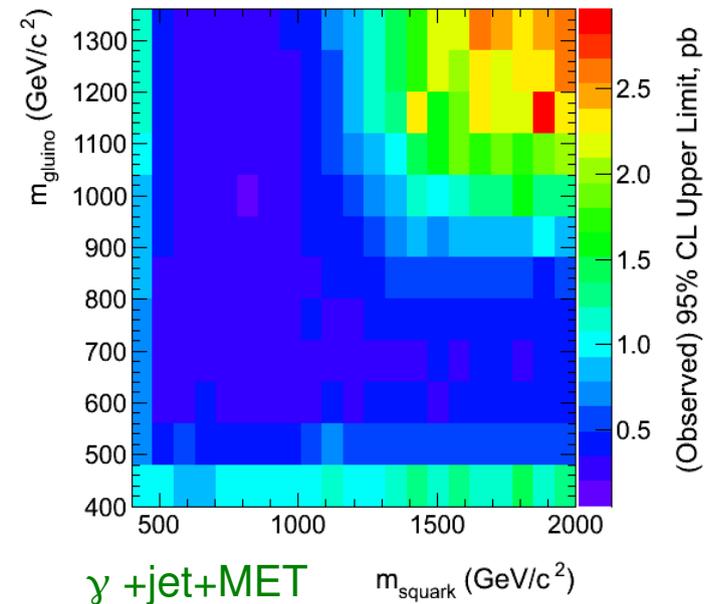

Bino-like neutralino

$\gamma\gamma$ +jet+MET

Wino-like neutralino

CMS preliminary $\int L dt = 1.14 \text{ fb}^{-1}$ $1\gamma, \geq 3 \text{ jets, MET} > 200 \text{ GeV}$

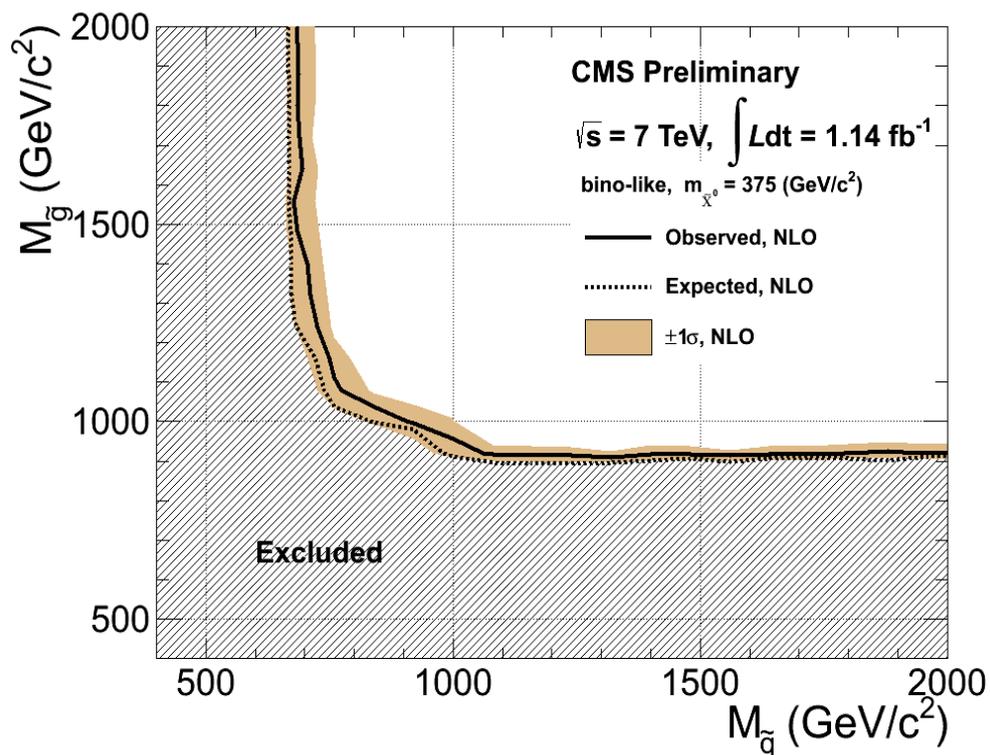

γ +jet+MET

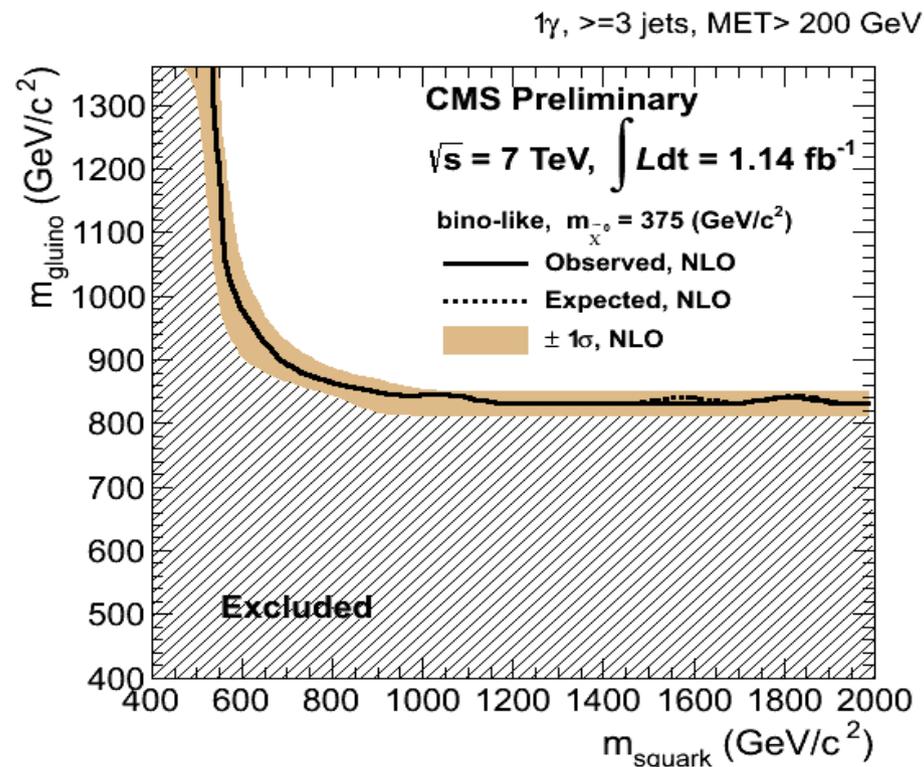

$m_{\text{squark}} (\text{GeV}/c^2)$

- “Bino like” GGM scan: $m_{\tilde{\chi}_0} = 375$ GeV, $m_{\text{squark,gluino}} = 400 \dots 2000$ GeV, steps 80 GeV, ~ 10000 Evts
- Sleptons and all gauginos except NLSP: 3.5 TeV, heavy right handed squarks

$\gamma\gamma$ +jet+MET, 1.1/fb

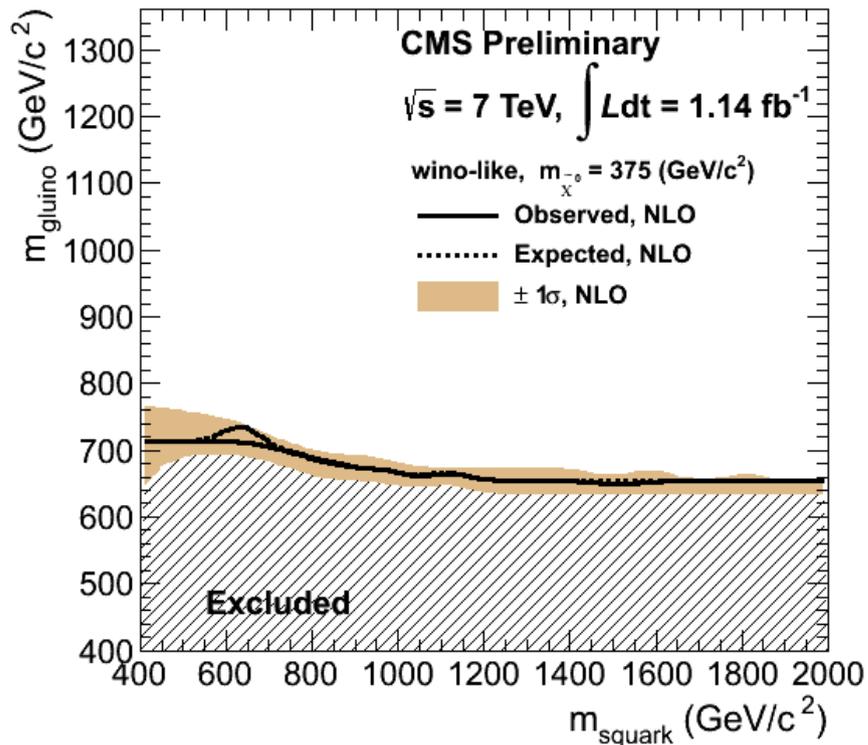

γ +jet+MET, 1.1/fb

γ +jet+MET, 1.1/fb

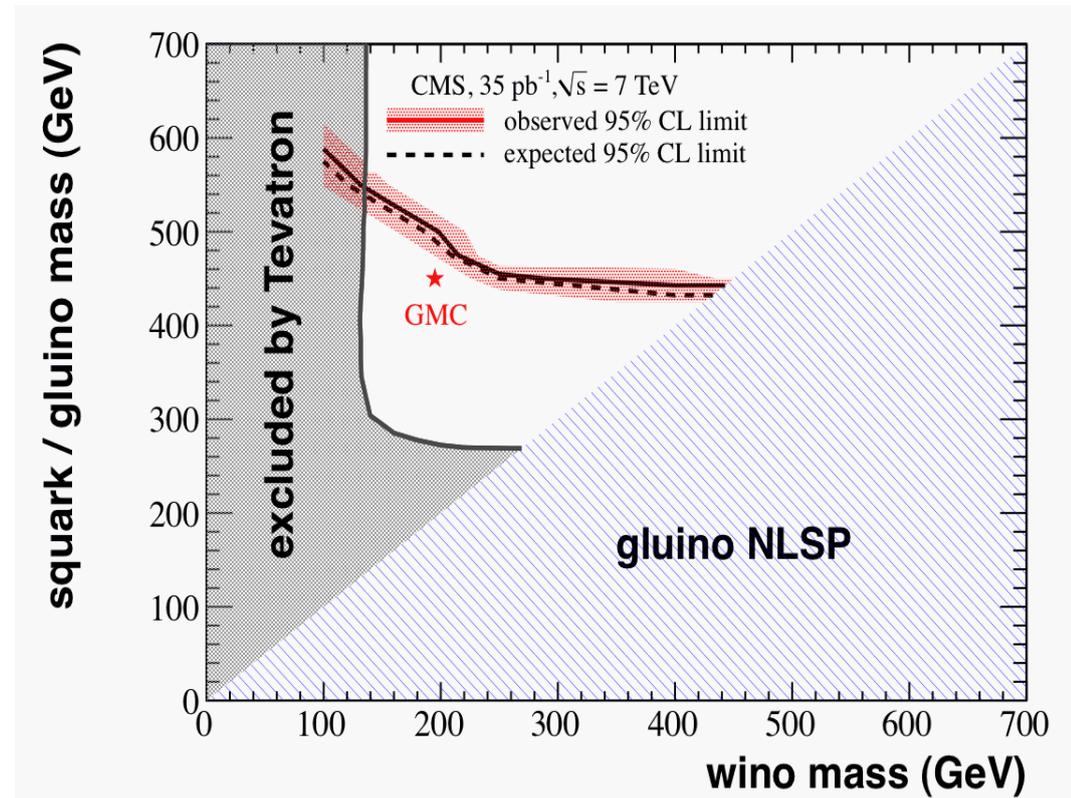

$1\gamma, \geq 3$ jets, MET > 200 GeV

“Wino like” GGM scan:

- Sleptons & gauginos (except NLSP): 3.5 TeV
- heavy right handed squarks
- NLSP mass = 375 GeV

γ +l+MET, 35/pb

“Wino like” NLSP -slightly different scenario:

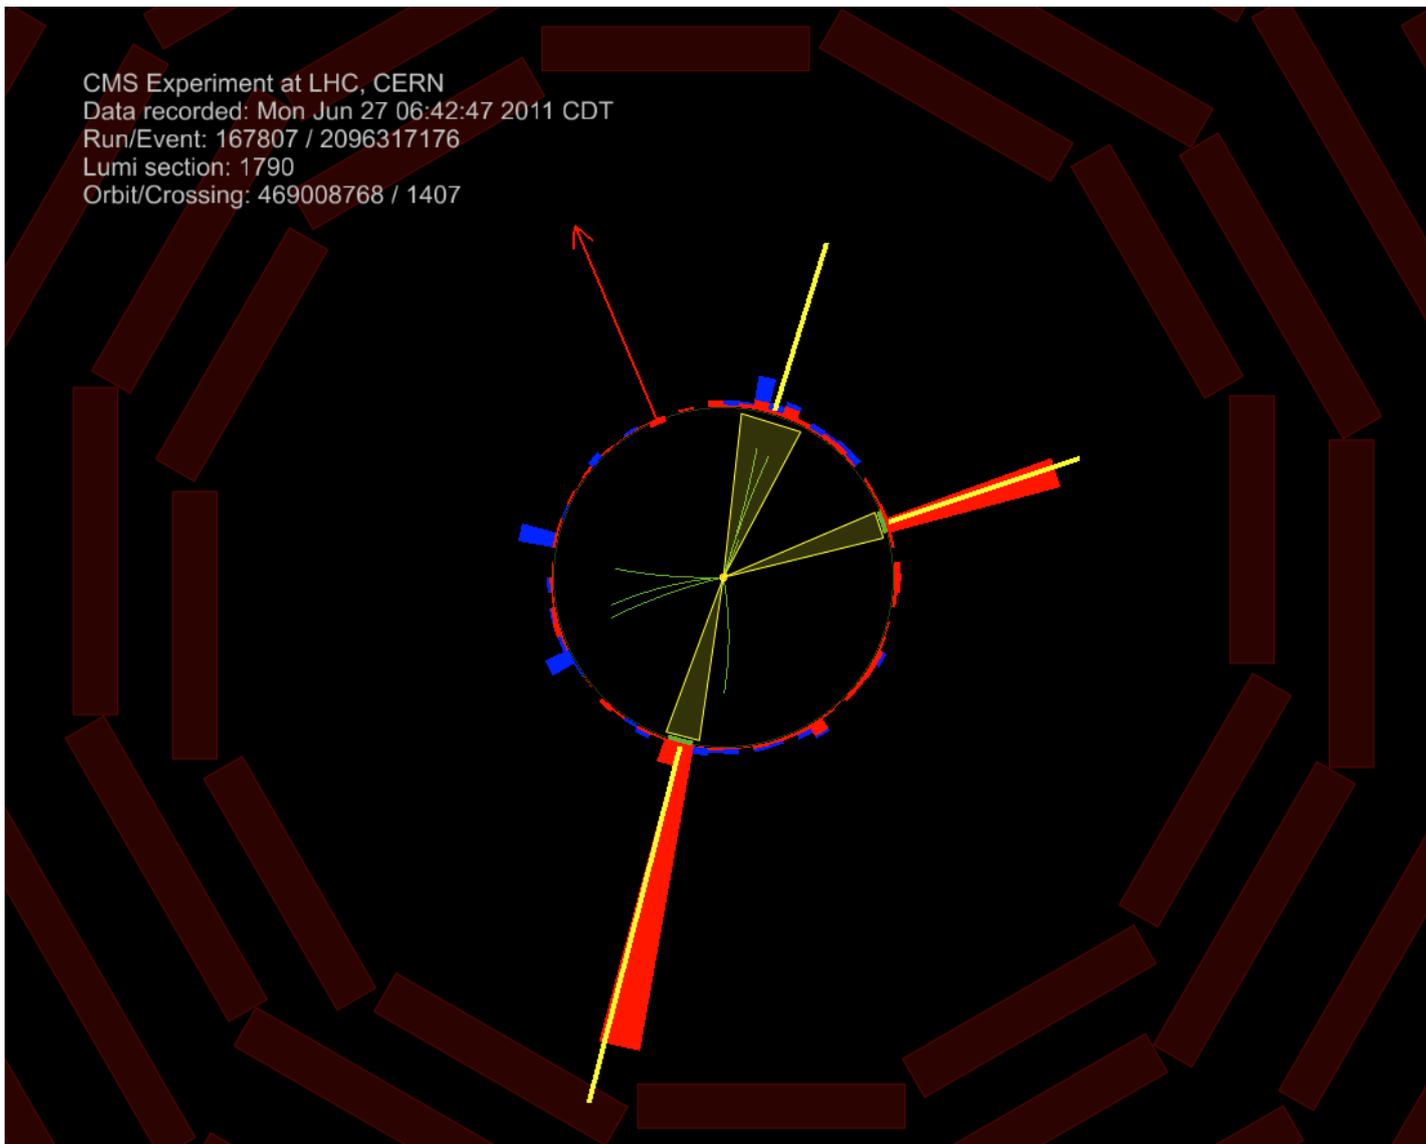

- $m_{\text{squark}} \sim m_{\text{gluino}}$, NLSP mass > 100 GeV
- $\tan \beta = 2$
- Bayesian upper limit

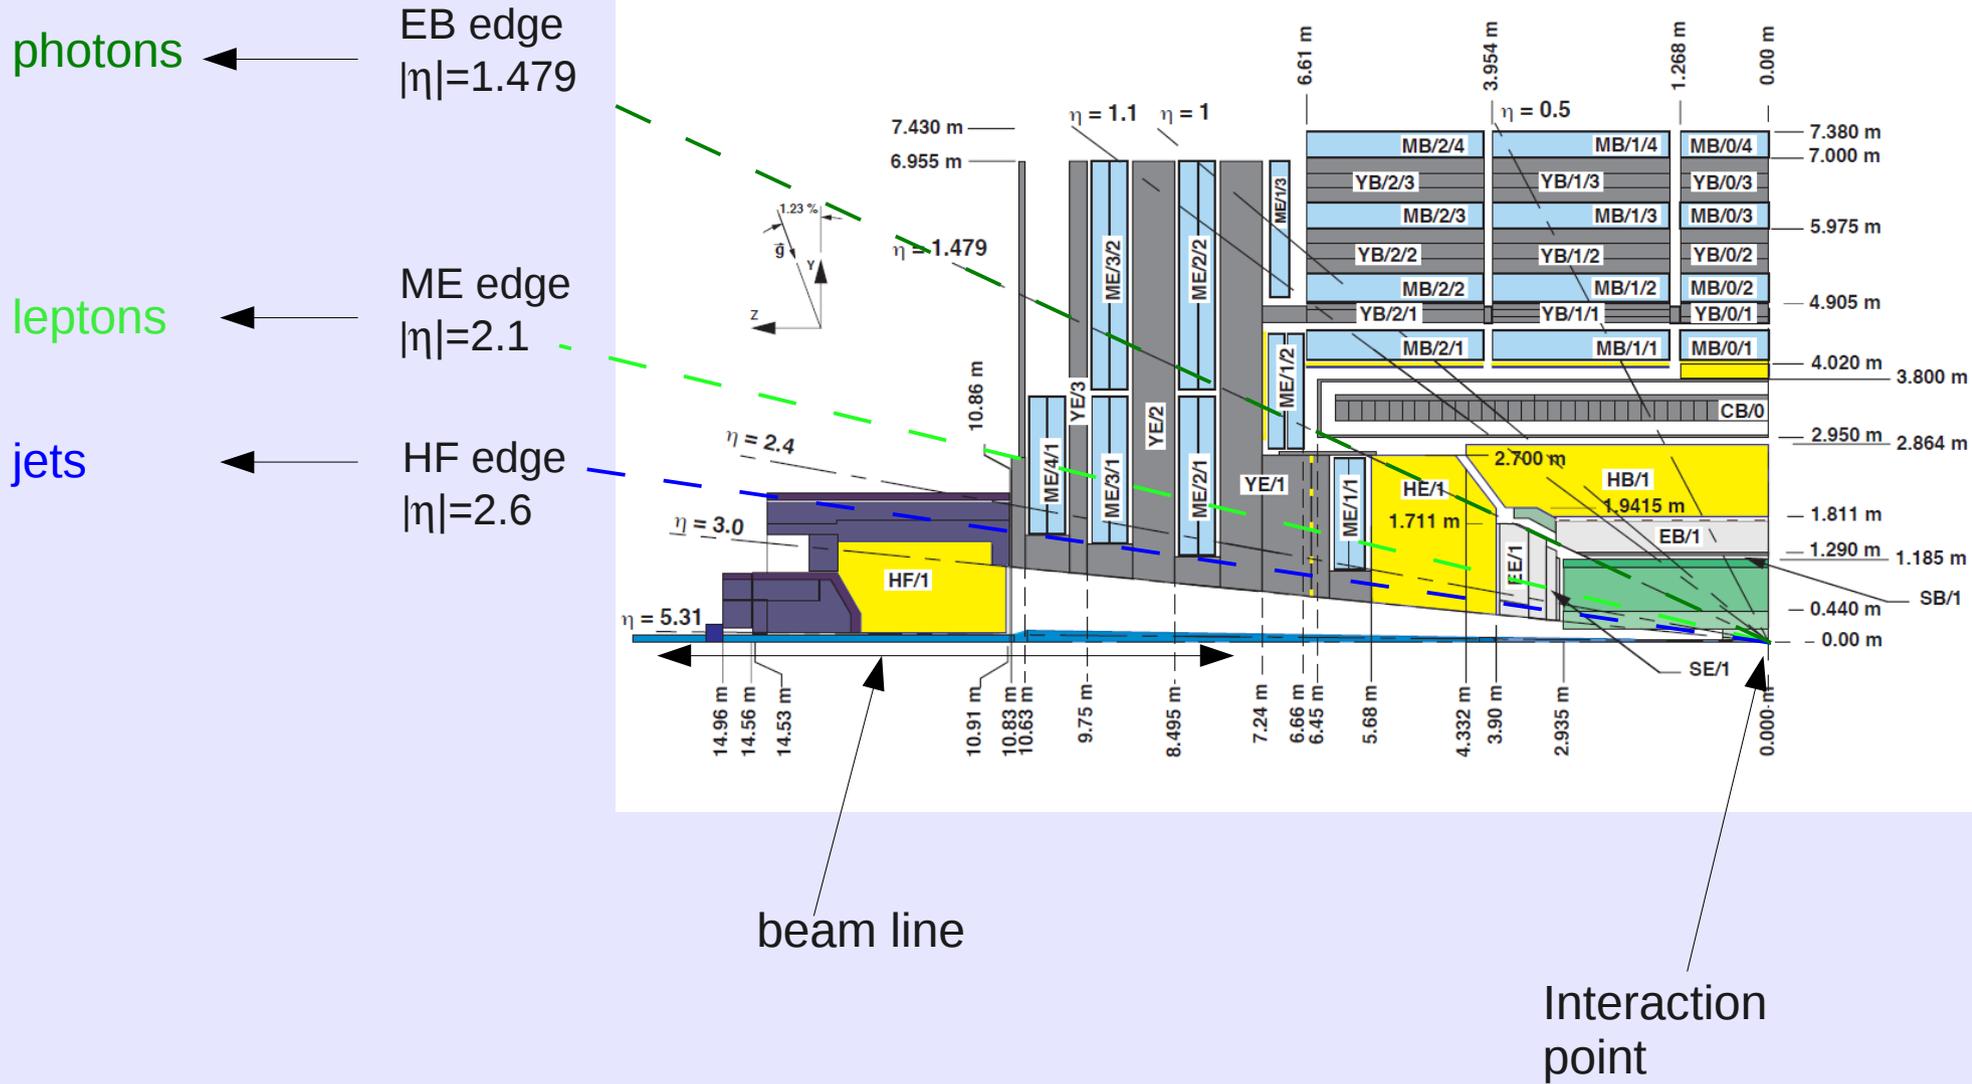

- Final states with photons expected in GMSB SUSY scenarios
 - Branching ratios to photon & W,Z,H depend on neutralino mixture

 - CMS analyses designed to cover broad range of possible final states
 - $\gamma + \text{jets} + \text{MET}$
 - $\gamma + \gamma + \text{MET}$
 - $\gamma + \text{l} + \text{MET}$
- } 1.14/fb results published: [PAS-SUS-11-09](#)
 } 35/pb result published: [JHEP 1106:093 \(2011\)](#)
- Data driven estimates for QCD/EWK backgrounds in place
 - No excess observed in data

 - Limits calculated for wino- and bino-like neutralino
 - bino-like NLSP $\approx m_{\text{squark}} \leq 650 \text{ GeV}$ & $m_{\text{gluino}} \leq 910 \text{ GeV}$ excluded
 - wino-like NLSP $\approx m_{\text{gluino}} \leq 650 \text{ GeV}$ excluded

CMS Experiment at LHC, CERN
Data recorded: Mon Jun 27 06:42:47 2011 CDT
Run/Event: 167807 / 2096317176
Lumi section: 1790
Orbit/Crossing: 469008768 / 1407

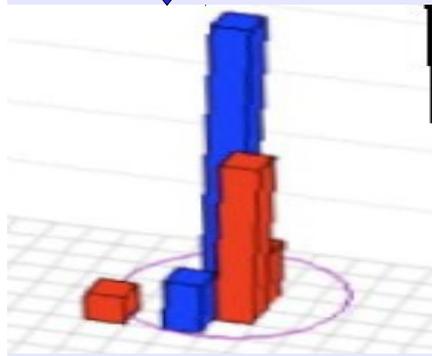

$$\cancel{E}_T := -\sum \vec{E}_i$$

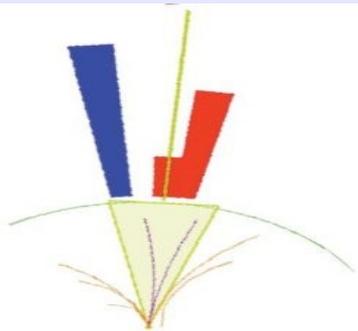

3 different Algorithms commissioned

hadronic Calorimeter
electromagnetic Calorimeter

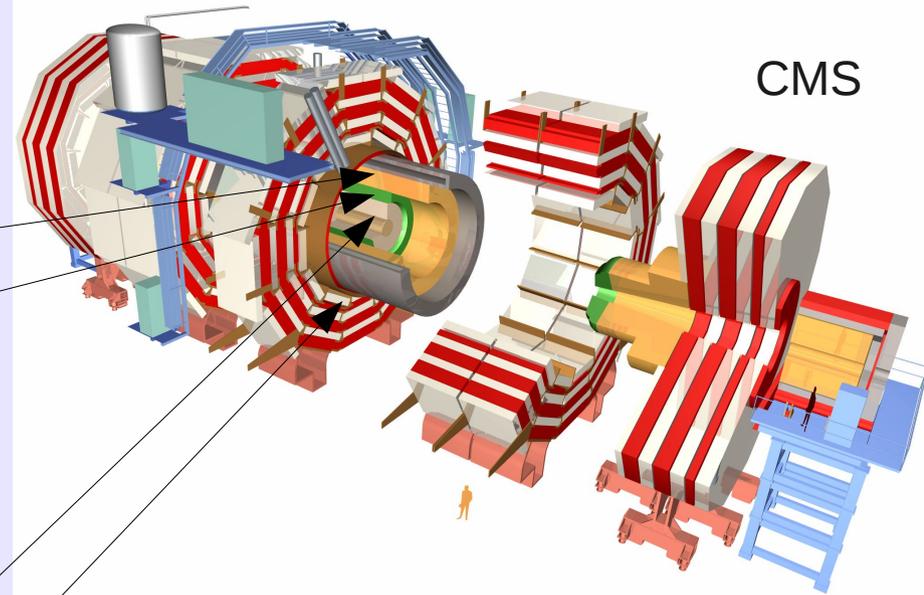

\cancel{E}_T :
Negative transverse
vectorsum over the
calorimetric energydeposits

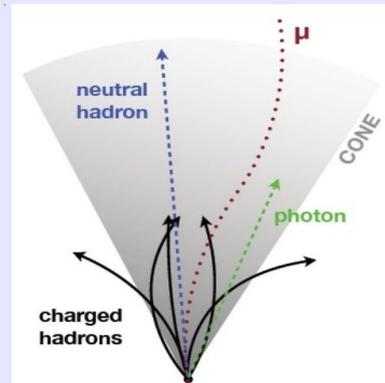

Tracker

\cancel{E}_T : Inclusion of the
measured track momenta
→ Correction of
calorimeter only
measurement

Muonchambers

\cancel{E}_T :
Negative transverse
vectorsum of
calibrated particles
(„particle flow“)

Object definitions - $\gamma/\gamma\gamma + \text{jets} + \text{MET}$

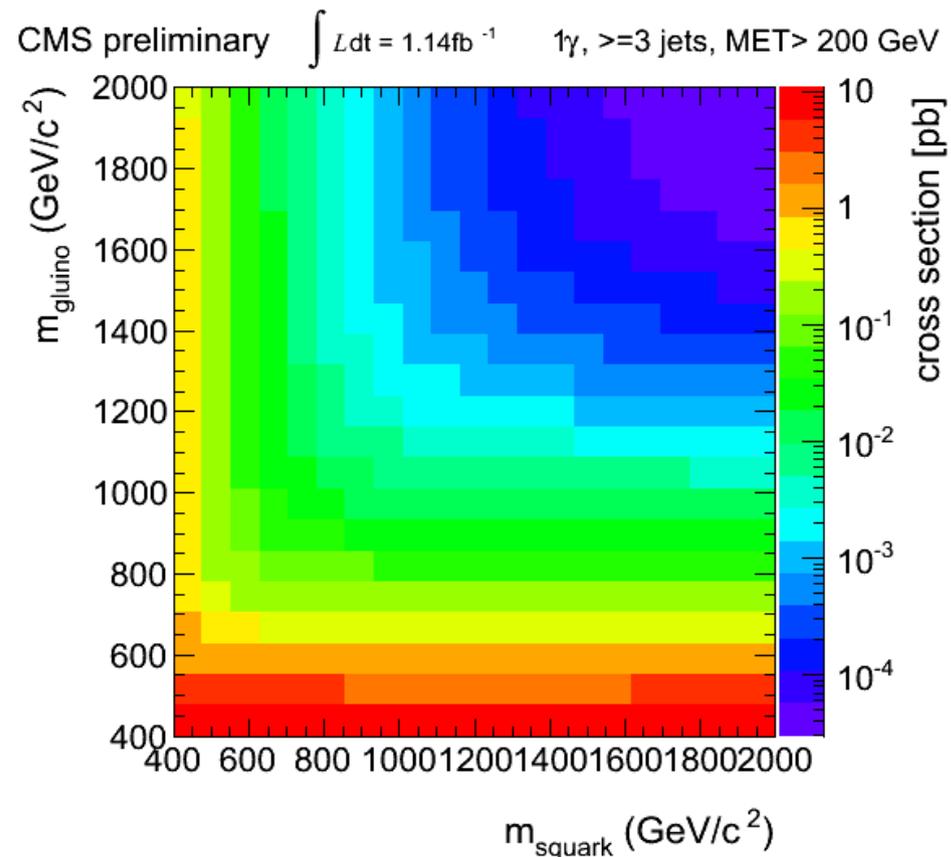

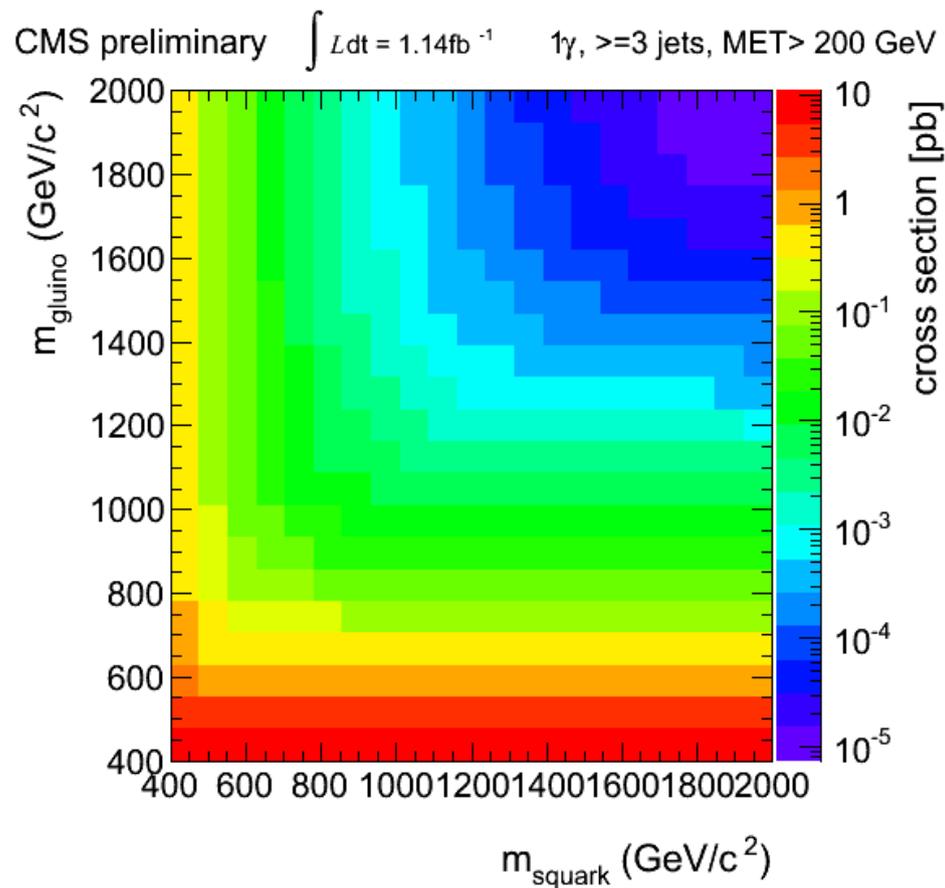

- In general all objects are particle flow objects (exception: photon, HT calculation)
- **Jets** are L1FastL2L3 corrected (Data: + Residual), anti k_T (R=0.5)
- **MET** Type-I corrected (for JES)
- **Photon** Id: (optimized for photons & electrons)
 - No Track: no matching hit pattern in pixel detector
 - Isolation:
 $ecalIso() < 4.2 + 0.006 * pt$ &
 $hcalIso() < 2.2 + 0.0025 * pt$ &
 $trackIso() < 2.0 + 0.001 * pt$
 - Shower shape: $\sigma_{in\eta} < 0.011$ &
 $HadronicOverEm() < 0.05$ &
 $r9() < 0.98$
- **Electrons**: like photon Id, but with pixel seed
- **HT**: scalar p_T sum of jets (CaloJets, anti k_T (R=0.5), $p_T > 40$ GeV, $|\eta| < 3.0$, no rejection of photons)

- Photon/lepton efficiency from MC, corrected by $\epsilon_{\text{data}}/\epsilon_{\text{MC}}$
 - Use $Z \rightarrow ee$ and $Z \rightarrow \mu\mu$ events
- Signal MC acceptance * efficiency * $\epsilon_{\text{data}}/\epsilon_{\text{MC}}$ (per photon/lepton)
 - Pixel match veto efficiency (MC): 96.4 +/- 0.5%
 - Photon: $\epsilon_{\text{data}}/\epsilon_{\text{MC}} = 0.953 \pm 0.068$
 - Electron: $\epsilon_{\text{data}}/\epsilon_{\text{MC}} = 0.928 \pm 0.015$ \longrightarrow Considered systematics:
 - Z signal and background shape
 - signal fit over/underestimation
 - pile up effects
 - MC electron/photon difference
 - Muon: $\epsilon_{\text{data}}/\epsilon_{\text{MC}} = 0.99 \pm 0.001$

Bino-like neutralino

Wino-like neutralino

Event yields: $\gamma + l + \text{MET}$
