Review of CERN Computer Centre Infrastructure

Thursday, May 24, 2012 3:10 PM (25 minutes)

The CERN Computer Centre is reviewing strategies for optimizing the use of the existing infrastructure in the future, and in the likely scenario that any extension will be remote from CERN, and in the light of the way other large facilities are today being operated. Over the past six months, CERN has been investigating modern and widely-used tools and procedures used for virtualisation, clouds and fabric management in order to reduce operational effort, increase agility and support unattended remote computer centres. This presentation will give the details on the project's motivations, current status and areas for future investigation.

Primary author: BELL, Tim (CERN)

Co-author: PANZER-STEINDEL, Bernd (CERN)

Presenter: BELL, Tim (CERN)

Session Classification: Computer Facilities, Production Grids and Networking

Track Classification: Computer Facilities, Production Grids and Networking (track 4)
