HiRes

- ▣ HiRes was a stereo fluorescence detector, operated from 1997-2006 on Dugway Proving Grounds in Utah
- ▣ Observe the air-showers created by CR's by collecting fluorescence light

HiRes

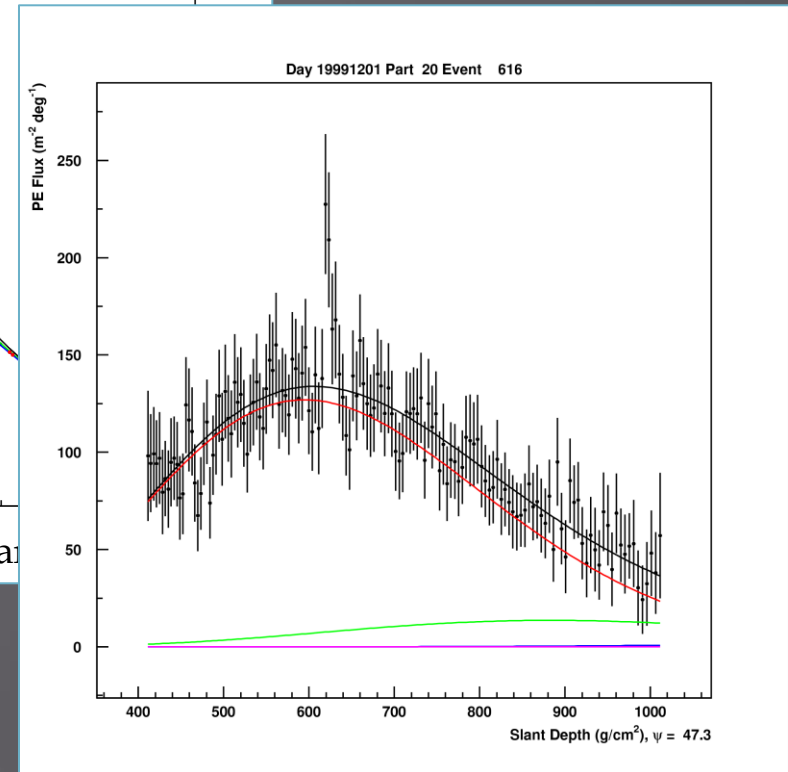

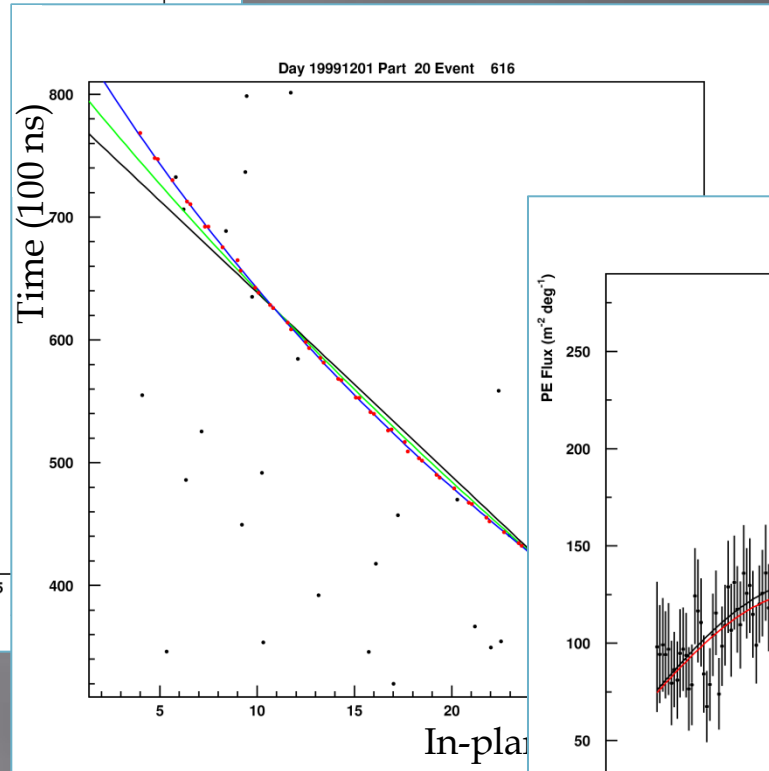

- ▣ Light collected by 5 m² mirrors onto an array of 256 (16×16) of PMT's
- ▣ Each PMT sees 1° cone
- ▣ Each PMT records time and amount of light seen

HiRes

HiRes Monocular Analysis

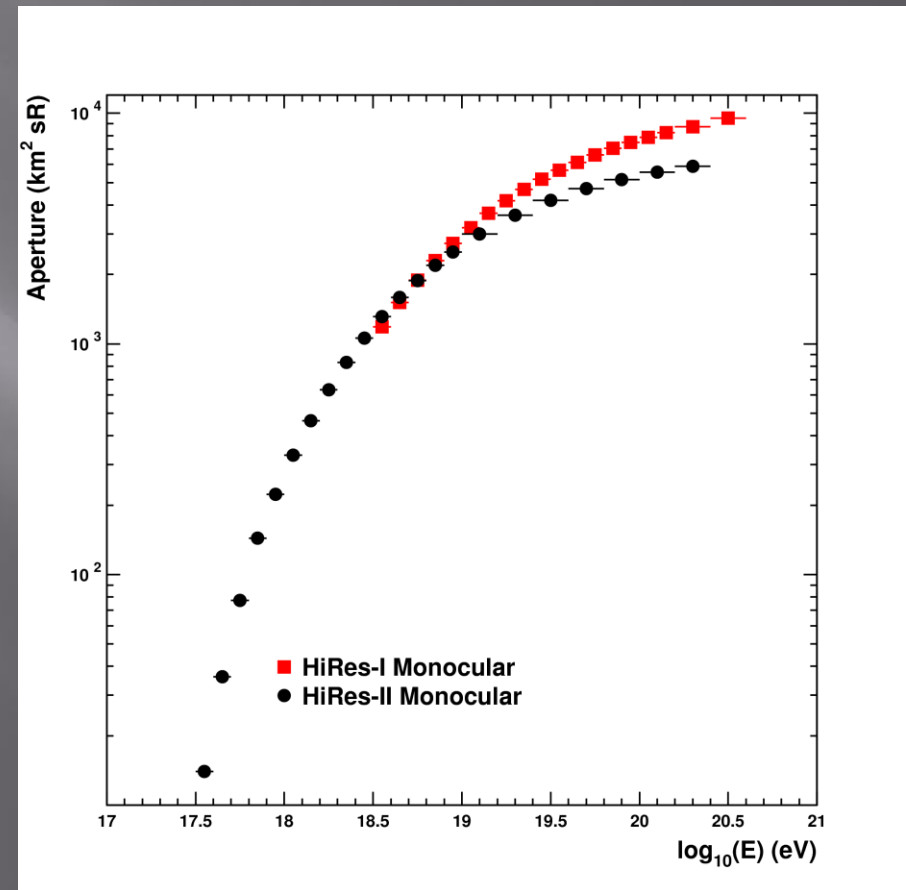

HiRes Monocular Spectrum

- Aperture
 - The aperture varies with energy...

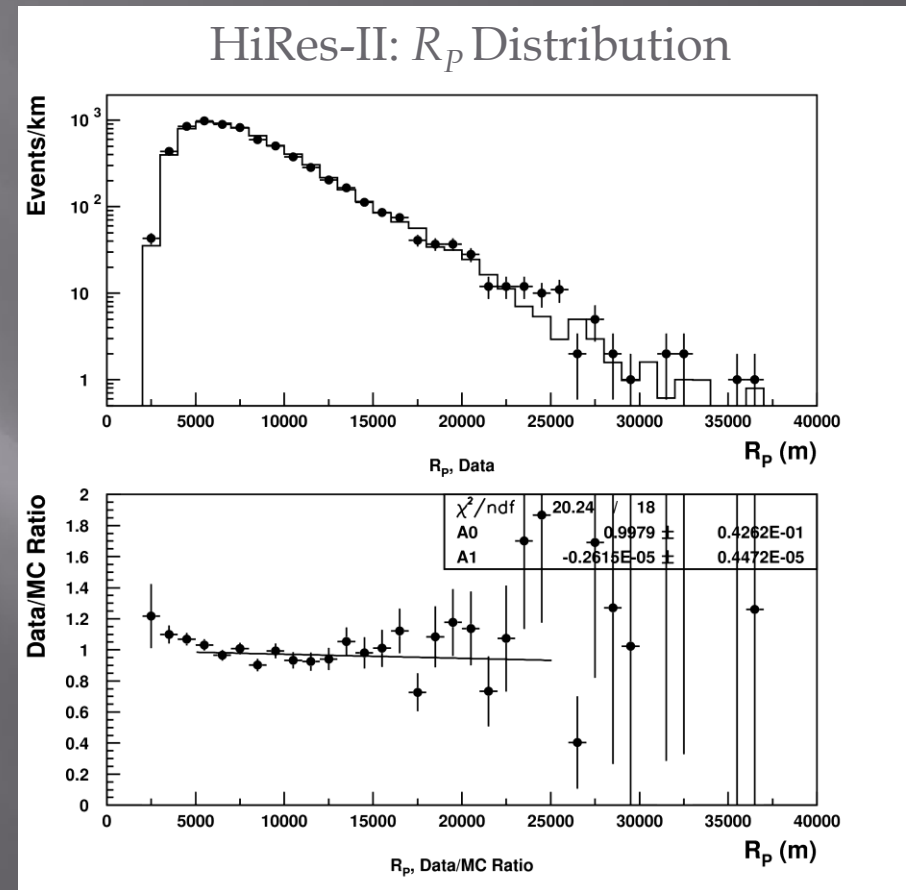

HiRes Monocular Spectrum

- ▣ Aperture
 - The aperture varies with energy...
 - ... but HiRes triggers on brightness
 - ▣ Systematic uncertainties from *detector* model **not** from *shower* model
 - ▣ Look at *bulk* of shower
 - ▣ Demonstrate understanding of the detector by Data/MC comparisons

HiRes Data/MC Comparisons

- Distance to shower
 - Constrains atmosphere
 - Constrains trigger threshold

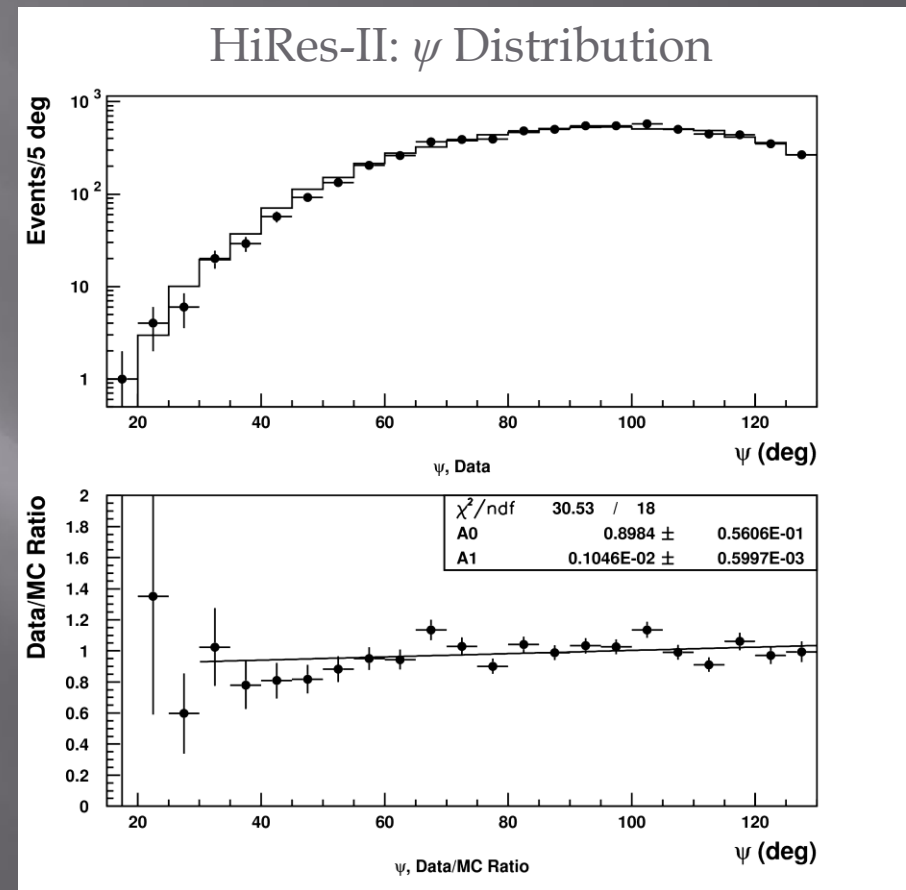

HiRes Data/MC Comparisons

- Distance to shower
 - Constrains atmosphere
 - Constrains trigger threshold

HiRes Data/MC Comparisons

- Distance to shower
 - Constrains atmosphere
 - Constrains trigger threshold
- Shower angle
 - Constrains atmosphere (Cherenkov)
 - Constrains resolution

HiRes Data/MC Comparisons

- Distance to shower
 - Constrains atmosphere
 - Constrains trigger threshold
- Shower angle
 - Constrains atmosphere (Cherenkov)
 - Constrains resolution

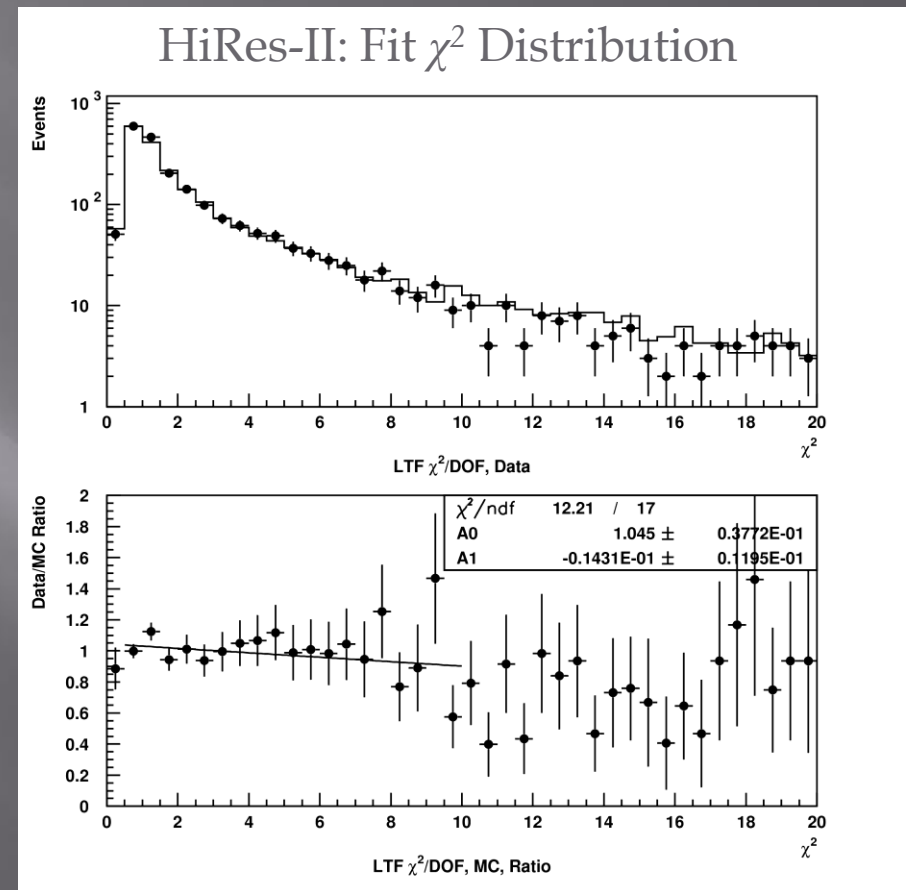

HiRes Data/MC Comparisons

- ▣ Distance to shower
 - Constrains atmosphere
 - Constrains trigger threshold
- ▣ Shower angle
 - Constrains atmosphere (Cherenkov)
 - Constrains resolution
- ▣ Angle and distance (range) *are* the aperture

HiRes Data/MC Comparisons

- Distance to shower
 - Constrains atmosphere
 - Constrains trigger threshold
- Shower angle
 - Constrains atmosphere (Cherenkov)
 - Constrains resolution
- Angle and distance (range) *are* the aperture
- Check resolution by check of χ^2 distribution

HiRes Monocular Spectra

- ▣ The HiRes monocular spectra were the first to see a UHE Cutoff
 - Most of the cutoff significance comes from HiRes-I
 - Ankle measurement largely due to HiRes-II

HiRes Monocular Spectra

- ▣ The HiRes monocular spectra were the first to see a UHE Cutoff
 - Most of the cutoff significance comes from HiRes-I
 - Ankle measurement largely due to HiRes-II
- ▣ 5- σ significance of cutoff: expect 43, see 13.

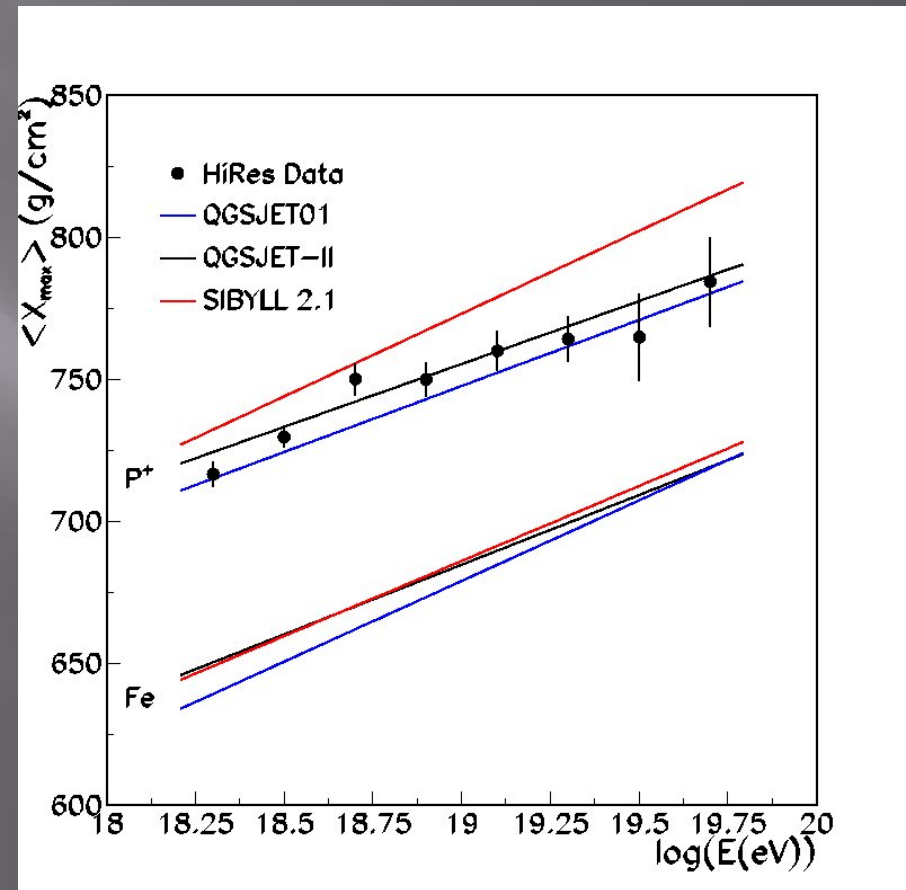

What is the Cutoff?

- ▣ The cutoff predicted by Greisen, Zatsepin and Kuzmin was from *protons interacting in transit with the CMB*

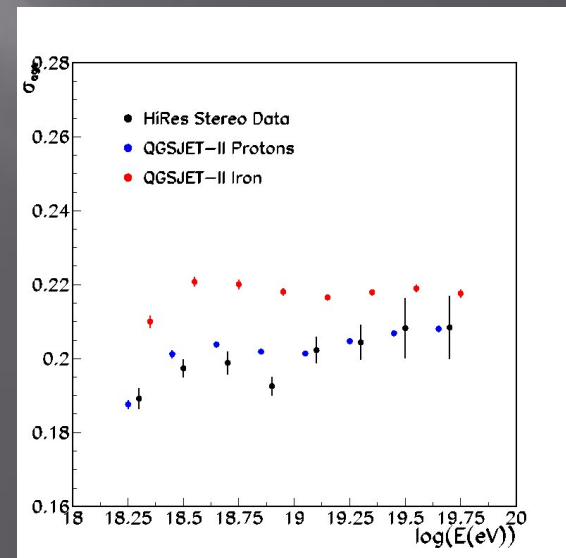

What is the Cutoff?

- ▣ The cutoff predicted by Greisen, Zatsepin and Kuzmin was from *protons* interacting *in transit* with the CMB
 - Observed composition should be consistent with protons

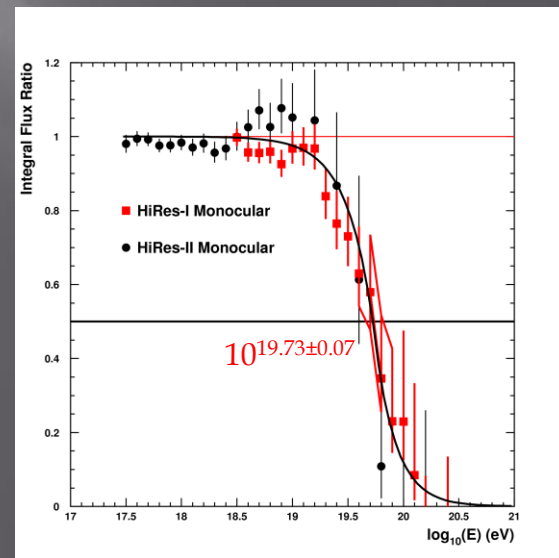

What is the Cutoff?

- ▣ The cutoff predicted by Greisen, Zatsepin and Kuzmin was from *protons* interacting *in transit* with the CMB
 - Observed composition should be consistent with protons

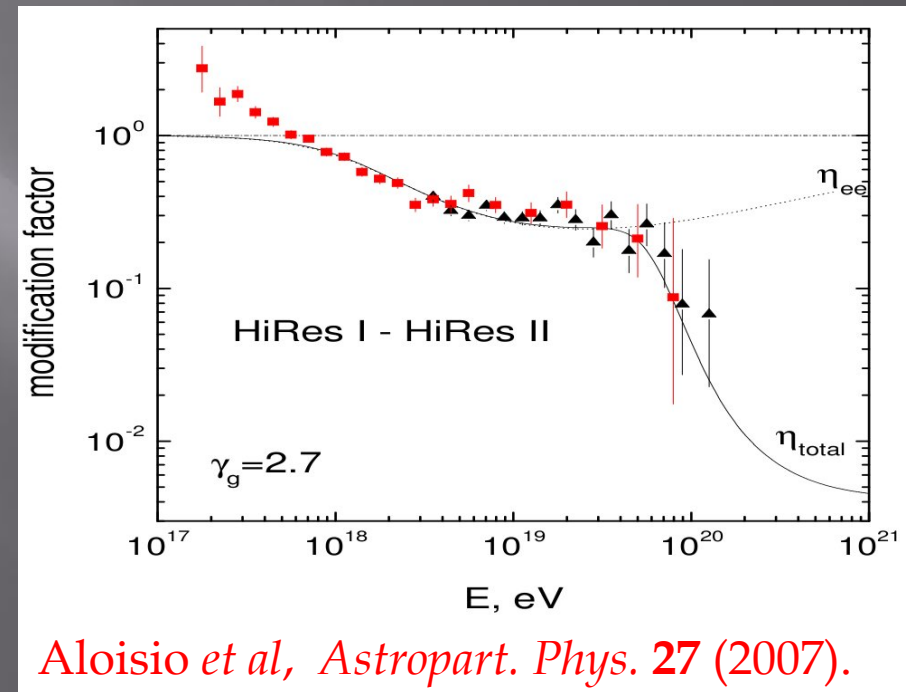

What is the Cutoff?

- ▣ The cutoff predicted by Greisen, Zatsepin and Kuzmin was from *protons* interacting *in transit* with the CMB
 - Observed composition should be consistent with protons
 - Cutoff energy should match prediction from Δ -production threshold

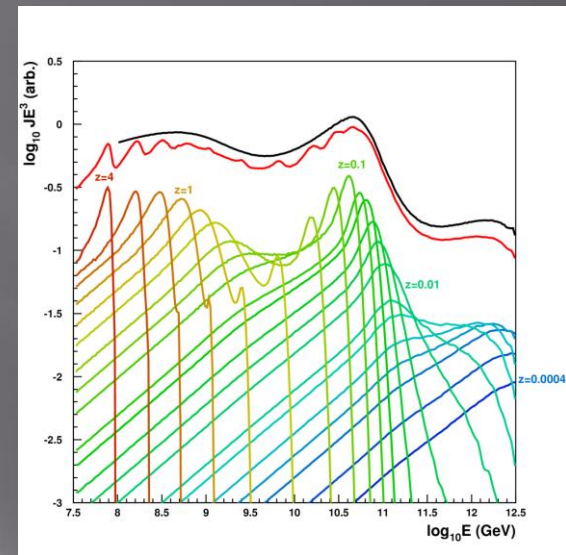

What is the Cutoff?

- ▣ The cutoff predicted by Greisen, Zatsepin and Kuzmin was from *protons* interacting *in transit* with the CMB
 - Observed composition should be consistent with protons
 - Cutoff energy should match prediction from Δ -production threshold

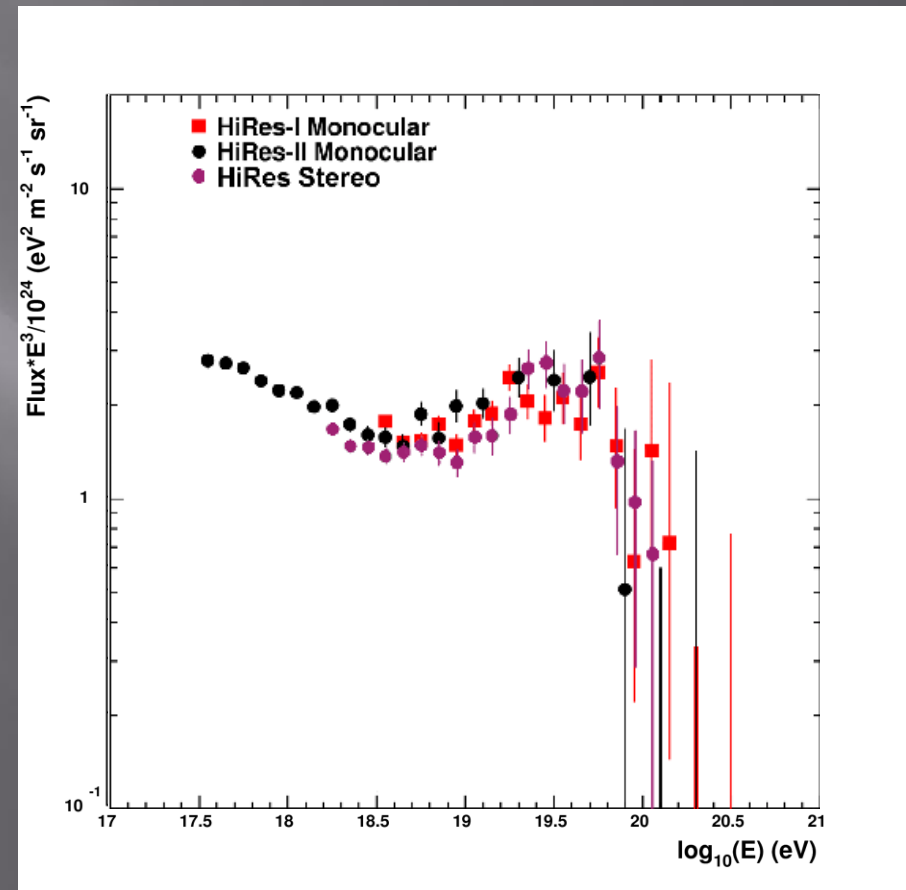

What is the Cutoff?

- ▣ The cutoff predicted by Greisen, Zatsepin and Kuzmin was from *protons* interacting *in transit* with the CMB
 - Observed composition should be consistent with protons
 - Cutoff energy should match prediction from Δ -production threshold
 - GZK *and* Ankle agree with CMD energy loss

HiRes Spectra

- ▣ HiRes observes the Ankle and a High Energy Cutoff
- ▣ Observed first in monocular, confirmed in stereo
- ▣ The cutoff is consistent with the GZK Cutoff in the *strict* interpretation as a result of *protons interacting in transit* with the CMB

Telescope Array

- ▣ Hybrid experiment
- ▣ Surface
 - 507 scintillation counters
 - 1.2 km spacing
 - 3 m², two layers.
- ▣ Fluorescence
 - 3 sites
 - Each 120° azimuth
 - 3°–31° elevation
- ▣ Over 3 years of data have been collected.

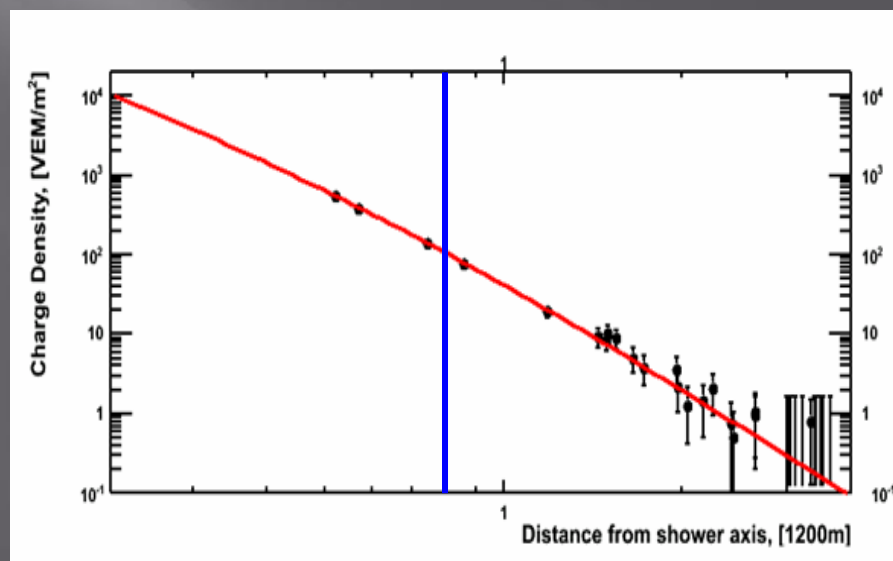

Telescope Array

- ▣ Hybrid experiment
- ▣ Surface
 - 507 scintillation counters

Typical Surface Detector Event

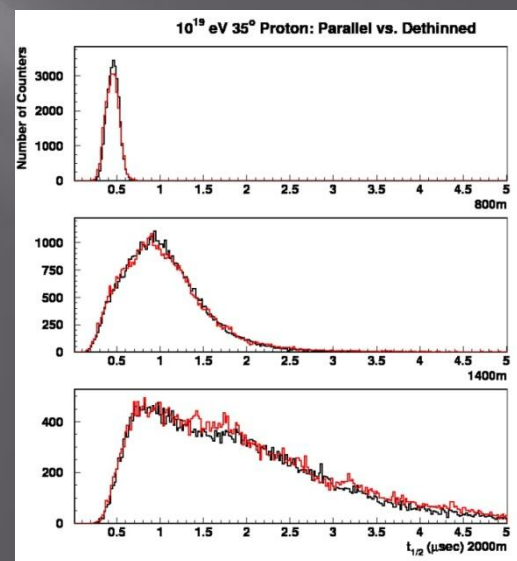

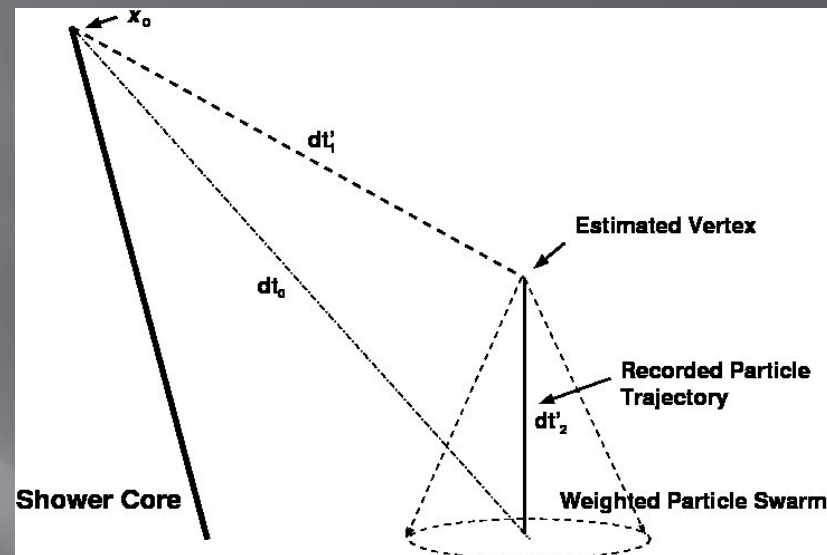

TA SD Spectrum

- Aperture
 - Unlike fluorescence, aperture constant above some threshold
 - Like fluorescence, aperture changes below that threshold
- By understanding detector response, can push well off efficiency plateau

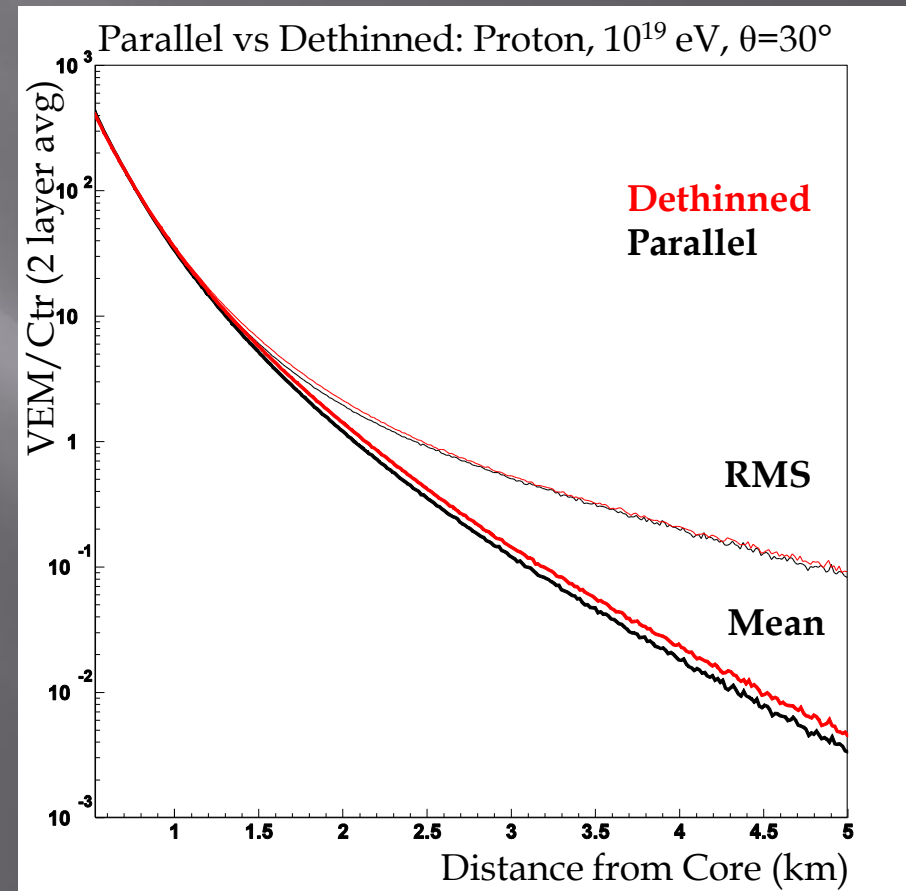

De-thinning

- To model detector need to produce lots of showers
- Can remove most of the statistical effects of thinning by spreading out weighted shower particles from Corsika as a swarm of particles coming from a calculated vertex
- Allows accurate reproduction of particle arrival times

Thinned & De-thinned vs Full

Data/MC Comparisons

Zenith Angle Distribution

LDF χ^2/ndof

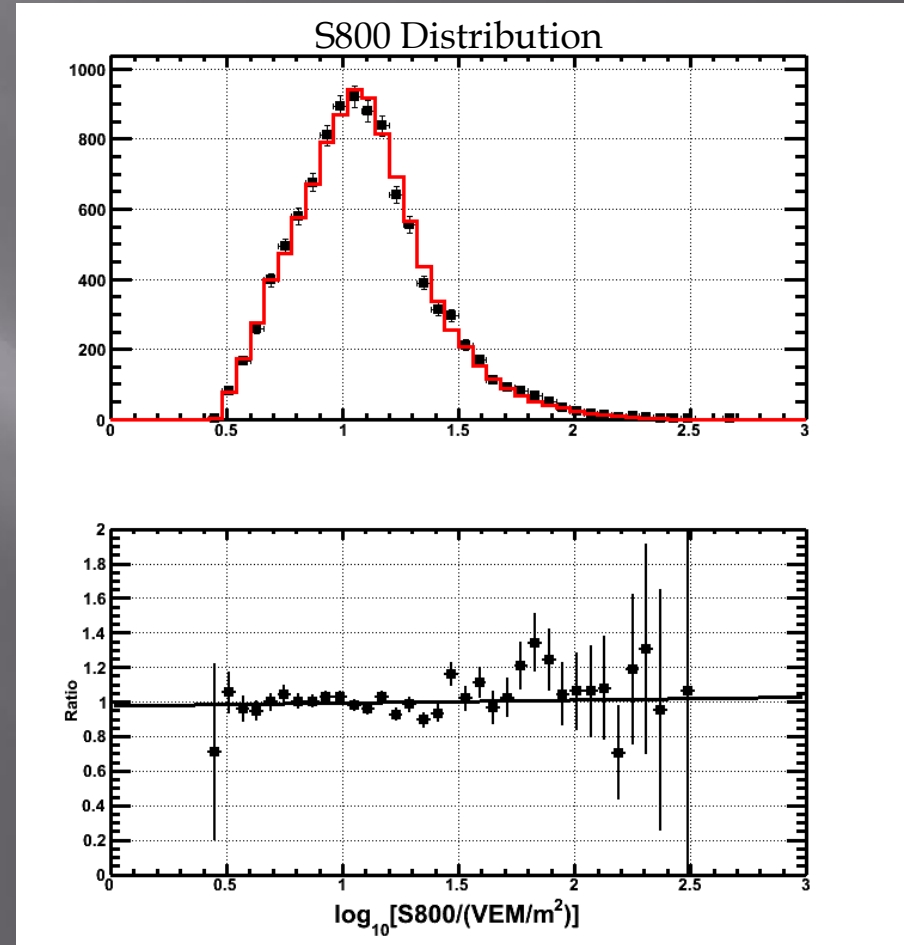

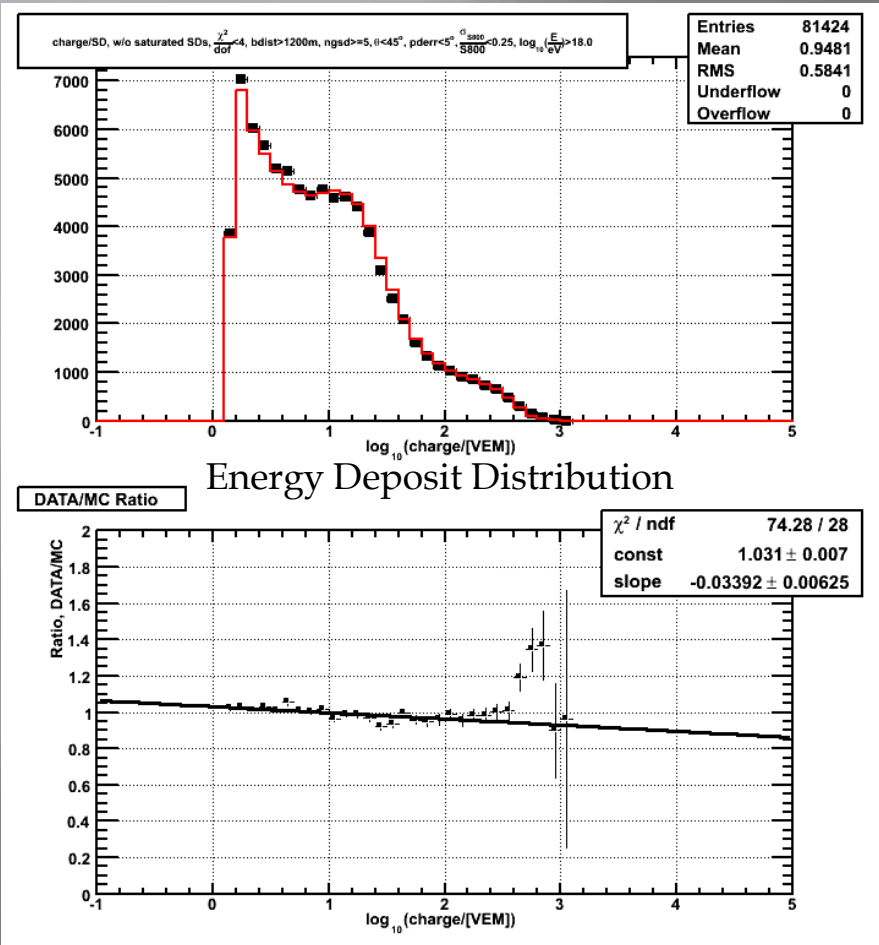

LDF χ^2 Distribution

DATA/MC Ratio

Data/MC Comparisons

Energy Determination

Energy vs S800 and Zenith Angle

Final Acceptance

- ▣ We trust out acceptance calculation down to $10^{18.2}$ eV, where the acceptance is 8% of the maximum
- ▣ Need Data/MC agreement to push this far off the plateau

TA SD Spectrum

- ▣ Spectral Slopes and Break Points in agreement with HiRes

TA SD Spectrum

- ▣ Spectral Slopes and Break Points in agreement with HiRes
- ▣ Flux also in agreement with HiRes
 - Not a given
 - Energy normalization done with *all* TA FD detectors, not just Middle Drum (HiRes)

HiRes and TA Spectra

Conclusion

- ▣ HiRes and TA spectra show remarkable agreement
 - Spectral slopes
 - Break points
 - Normalization
- ▣ The secret to our success:
 - Simulate the detector well: Data/MC comparisons
 - Remove *shower* model uncertainty by looking at or normalizing to the bulk properties of the shower
