Physics Performance Report for:

\bar{P} ANDA

(AntiProton Annihilations at Darmstadt)

Strong Interaction Studies with Antiprotons

\bar{P} ANDA Collaboration

To study fundamental questions of hadron and nuclear physics in interactions of antiprotons with nucleons and nuclei, the universal \bar{P} ANDA detector will be build. Gluonic excitations, the physics of strange and charm quarks and nucleon structure studies will be performed with unprecedented accuracy thereby allowing high-precision tests of the strong interaction. The proposed \bar{P} ANDA detector is a state-of-the-art internal target detector at the HESR at FAIR allowing the detection and identification of neutral and charged particles generated within the relevant angular and energy range. This report presents a summary of the physics accessible at \bar{P} ANDA and what performance can be expected.
