New results for algebraic NLO
Tensor reduction of Feynman integrals

Tord Riemann

DESY, Zeuthen, Germany

A simple example

1-loop self-energy:

$$I_2^\mu = \int \frac{d^d k}{i\pi^{d/2}} \ \frac{k^\mu}{[k^2 - M_1^2]\,[(k+p)^2 - M_2^2]}$$
$$= p_\mu B_1$$

Solve:

$$p_\mu I_2^\mu = p^2 B_1(p, M_1, M_2)$$
$$= \int \frac{d^d k}{i\pi^{d/2}} \ \frac{pk}{[k^2 - M_1^2]\,[(k+p)^2 - M_2^2]} = \int \frac{d^d k}{i\pi^{d/2}} \ \frac{pk}{D_1 \ D_2}$$
$$= \int \frac{d^d k}{i\pi^{d/2}} \ \left[\frac{D_2 - (p^2 - M_2^2 - M_1^2) - D_1}{D_1 \ D_2} \right],$$
$$B_1(p, M_1, M_2) = \frac{1}{2p^2} \left[A_0(M_1) - A_0(M_2) - (p^2 - M_2^2 - M_1^2) B_0(p, M_1, M_2) \right]$$

A tensor Feynman integral is expressed in terms of scalar Feynman integrals.

Systematic approach

to tensor reductions:
1- to 4-point functions: Passarino, Veltman 1978 [1]

Need in addition a library of scalar functions:
'tHooft, Veltman 1979 [2]
State of the art + open source programs:
K. Ellis and G. Zanderighi, QCDloop/FF [3, 4] 2007,1990
T. Hahn, LoopTools/FF [5, 4] 1998,1990

Open source programs for 5,6,7-point reductions:

- LoopTools/FF [T. Hahn et al.]
- Golem/OPP etc. [G. Heinrich; A. van Hameren, this conference]
- HELAC/PHEGAS/OPP etc. [A. van Hameren, this conference]

$\rightarrow$ c++ code PJFry by V. Yundin, PhD thesis + [6] 2010
[Fleischer/Riemann/Yundin group], released this Summer 2011

This talk: Efficient reduction formulae in the algebraic Fleischer-Davydychev-Tarasov approach

Recent developments in the Fleischer-Davydychev-Tarasov approach:

- Get $n > 4$ tensor reduction with $\cdots$:
- $\cdots$ arbitrary masses
- $\cdots$ killed pentagon Gram determinants
- $\cdots$ treatment of full kinematics, also with small sub-diagram Gram determinants
  $\rightarrow$ presented by J. Fleischer at QCD@LHC@Trento2010
- $\rightarrow$ c++ code PJFry, $n \leq 5$ by V. Yundin [$\rightarrow$ GOLEM option]
  see talk at LHCphenonet Meeting 02/2011
- $\cdots$ multiple sums over tensor coefficients made efficient by contracting with external momenta arXiv/1104.4067, PLB 701(2011)646
- $\cdots$ $n \geq 7$ – a fresh look

Notations: Gram and modified Cayley determinant, signed minors [Melrose:1965]

Gram determinant G_n:

$$G_n \quad = \quad |2q_i q_j|, i,j = 1, \ldots n \tag{1}$$

Modified Cayley determinant $()_N$ of a diagram with N internal lines and chords q_j; for a choice $q_n = 0$, both determinants are related:

$$()_N \equiv \begin{vmatrix} 0 & 1 & 1 & \ldots & 1 \\ 1 & Y_{11} & Y_{12} & \ldots & Y_{1N} \\ 1 & Y_{12} & Y_{22} & \ldots & Y_{2N} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 1 & Y_{1N} & Y_{2N} & \ldots & Y_{NN} \end{vmatrix} = -G_{N-1}, \tag{2}$$

where $D_i = (k - q_i)^2 - m_i^2$ [with q_i = chord], and the matrix elements

$$Y_{ij} = -(q_i - q_j)^2 + m_i^2 + m_j^2, \quad (i,j = 1 \ldots N) \tag{3}$$

$\Rightarrow$ The Gram determinant $()_N$ does not depend on the masses.

Notations: signed minors [Melrose:1965]

signed minors of $()_N$ are constructed by deleting m rows and m columns from $()_N$, and multiplying with a sign factor:

$$\left(\begin{array}{cccc} j_1 & j_2 & \cdots & j_m \\ k_1 & k_2 & \cdots & k_m \end{array} \right)_N \equiv$$

$$\equiv (-1)^{\sum_l (j_l + k_l)} \text{sgn}_{\{j\}} \, \text{sgn}_{\{k\}} \left| \begin{array}{l} \text{rows } j_1 \cdots j_m \text{ deleted} \\ \text{columns } k_1 \cdots k_m \text{ deleted} \end{array} \right| \qquad (4)$$

where $\text{sgn}_{\{j\}}$ and $\text{sgn}_{\{k\}}$ are the signs of permutations that sort the deleted rows $j_1 \cdots j_m$ and columns $k_1 \cdots k_m$ into ascending order.

Example:

$$\left(\begin{array}{c} 0 \\ 0 \end{array} \right)_N \equiv \left| \begin{array}{cccc} Y_{11} & Y_{12} & \ldots & Y_{1N} \\ Y_{12} & Y_{22} & \ldots & Y_{2N} \\ \vdots & \vdots & \ddots & \vdots \\ Y_{1N} & Y_{2N} & \ldots & Y_{NN} \end{array} \right|, \qquad (5)$$

## Example: Getting a 4-point function from a six-point function I

Figure: A six-point topology (a) leading to four-point functions (b) with realistically vanishing Gram determinants.

Example: Getting a 4-point function from a six-point function II

The example is taken from [12].

The corresponding 4-point tensor integrals are, in LoopTools [5, 13] notation:

$$\text{D0i}(\text{id}, 0, 0, s_{\bar{\nu}u}, t_{ed}, t_{\bar{e}\mu}, s_{\mu\bar{\nu}u}, 0, M_Z^2, 0, 0). \tag{6}$$

The Gram determinant is:

$$()_4 = -2t_{\bar{e}\mu}[s_{\mu\bar{\nu}u}^2 + s_{\bar{\nu}u}t_{ed} - s_{\mu\bar{\nu}u}(s_{\bar{\nu}u} + t_{ed} - t_{\bar{e}\mu})], \tag{7}$$

It vanishes if:

$$t_{ed} \rightarrow t_{ed,\text{crit}} = \frac{s_{\mu\bar{\nu}u}(s_{\mu\bar{\nu}u} - s_{\bar{\nu}u} + t_{\bar{e}\mu})}{s_{\mu\bar{\nu}u} - s_{\bar{\nu}u}}. \tag{8}$$

In terms of a dimensionless scaling parameter x,

$$t_{ed} = (1+x)t_{ed,\text{crit}}, \tag{9}$$

Example: Getting a 4-point function from a six-point function III

the Gram determinant becomes:

$$()_4 = 2 \, x \, s_{\mu\bar{\nu}u} t_{\bar{e}\mu} (s_{\mu\bar{\nu}u} - s_{\bar{\nu}u} + t_{\bar{e}\mu}). \tag{10}$$

We will also need the modified Cayley determinant:

$$\binom{0}{0}_4 = \begin{pmatrix} 2M_Z^2 & M_Z^2 & M_Z^2 - s_{\mu\bar{\nu}u} & M_Z^2 \\ M_Z^2 & 0 & -s_{\bar{\nu}u} & M_Z^2 \\ M_Z^2 - s_{\mu\bar{\nu}u} & -s_{\bar{\nu}u} & 0 & -t_{ed} \\ M_Z^2 & -t_{\bar{e}\mu} & -t_{ed} & 0 \end{pmatrix}$$

$$= s_{\mu\bar{\nu}u}^2 t_{\bar{e}\mu}^2 + 2 \, M_Z^2 t_{\bar{e}\mu} [-2s_{\bar{\nu}u} t_{ed} + s_{\mu\bar{\nu}u}(s_{\bar{\nu}u} + t_{ed} - t_{\bar{e}\mu})]$$

$$+ M_Z^4 (s_{\bar{\nu}u}^2 + (t_{ed} - t_{\bar{e}\mu})^2 - 2s_{\bar{\nu}u}(t_{ed} + t_{\bar{e}\mu})).$$

Dimensional shifts and recurrence relations for pentagons (I)

Following [Davydychev:1991 [7]]
Replace tensors by scalar integrals in higher dimensions:
Example $R = 3$:

$$
\begin{aligned}
I_5^{\mu\nu\lambda} &= \int \frac{d^{4-2\epsilon}k}{i\pi^{d/2}} \prod_{r=1}^{5} c_r^{-1} k^\mu k^\nu k^\lambda \qquad (11) \\
&= -\sum_{i,j,k=1}^{4} q_i^\mu q_j^\nu q_k^\lambda n_{ijk} I_{5,ijk}^{[d+]^3} + \frac{1}{2}\sum_{i=1}^{n-1}(g^{\mu\nu}q_i^\lambda + g^{\mu\lambda}q_i^\nu + g^{\nu\lambda}q_i^\mu)I_{5,i}^{[d+]^2},
\end{aligned}
$$

and $n_{ijk} = (1 + \delta_{ij})(1 + \delta_{ik} + \delta_{jk})$.

$[d+]^l = 4 - 2\epsilon + 2l$

$I_{5,i}^{[d+]^2}$ – scratch the line i from $I_5^{[d+]^2}$.

Dimensional shifts and recurrence relations for pentagons (II)

'Naive', direct approach – just perform dimensional recurrences

Following [Tarasov:1996,Fleischer:1999 [8, 9]]
apply recurrence relations, relating scalar integrals of different dimensions, in order to get rid of the dimensionalities $[d+]^l = 4 - 2\epsilon + 2l$:

$$\nu_j \left(\mathbf{j}^+ I_5^{[d+]} \right) = \frac{1}{()_5} \left[-\binom{j}{0}_5 + \sum_{k=1}^5 \binom{j}{k}_5 \mathbf{k}^- \right] I_5 \tag{12}$$

$$\left(d - \sum_{i=1}^5 \nu_i + 1 \right) I_5^{[d+]} = \frac{1}{()_5} \left[\binom{0}{0}_5 - \sum_{k=1}^5 \binom{0}{k}_5 \mathbf{k}^- \right] I_5, \tag{13}$$

also:

$$\nu_j \mathbf{j}^+ I_5 = \frac{1}{\binom{0}{0}_5} \sum_{k=1}^5 \binom{0j}{0k}_5 \left[d - \sum_{i=1}^5 \nu_i (\mathbf{k}^- \mathbf{i}^+ + 1) \right] I_5 \tag{14}$$

where the operators $\mathbf{i}^\pm, \mathbf{j}^\pm, \mathbf{k}^\pm$ act by shifting the indices ν_i, ν_j, ν_k by ± 1.

The result of simplifying manipulations

. . . and collecting all contributions, our final result for e.g. the tensor of rank $R = 3$ can be written as follows:

$$I_5^{\mu\nu\lambda} = \sum_{i,j,k=1}^{4} q_i^{\mu} q_j^{\nu} q_k^{\lambda} E_{ijk} + \sum_{k=1}^{4} g^{[\mu\nu} q_k^{\lambda]} E_{00k}, \tag{15}$$

with:

$$E_{00j} = \sum_{s=1}^{5} \frac{1}{\binom{0}{0}_5} \left[\frac{1}{2} \binom{0s}{0j}_5 I_4^{[d+],s} - \frac{d-1}{3} \binom{s}{j}_5 I_4^{[d+]^2,s} \right], \tag{16}$$

$$E_{ijk} = -\sum_{s=1}^{5} \frac{1}{\binom{0}{0}_5} \left\{ \left[\binom{0j}{sk}_5 I_{4,i}^{[d+]^2,s} + (i \leftrightarrow j) \right] + \binom{0s}{0k}_5 \nu_{ij} I_{4,ij}^{[d+]^2,s} \right\}. \tag{17}$$

✓ no scalar 5-point integrals in higher dimensions
✓ no inverse Gram det. $()_5$
　　　We have yet:

† scalar 4-point integrals in higher dimensions: $I_{4,ij}^{[d+]^2,s}$ etc.

† inverse Gram det. $\binom{0}{0}_5 \equiv ()_4$

Reduce $I_{4,ij\cdots}^{[d+]^l,s}$ to $I_4^{[d+]^L,s}$ plus simpler objects I

By nontrivial manipulations we get e.g.:

$$I_{4,i}^{[d+],s} = \frac{1}{\binom{0s}{0s}_5}\left[-\binom{0s}{is}_5(d-3)I_4^{[d+],s} + \sum_{t=1}^{5}\binom{0st}{0si}_5 I_3^{st}\right] \quad (18)$$

$$\nu_{ij}I_{4,ij}^{[d+]^2} = \frac{\binom{0}{i}_4}{\binom{0}{0}_4}\frac{\binom{0}{j}_4}{\binom{0}{0}_4}(d-2)(d-1)I_4^{[d+]^2} + \frac{\binom{0i}{0j}_4}{\binom{0}{0}_4}I_4^{[d+]}$$

$$-\frac{\binom{0}{j}_4}{\binom{0}{0}_4}\frac{d-2}{0}\sum_{t=1}^{4}\binom{0t}{0i}_4 I_3^{[d+],t} + \frac{1}{\binom{0}{0}_4}\sum_{t=1}^{4}\binom{0t}{0j}_4 I_{3,i}^{[d+],t}(19)$$

These equations are free of inverse Gram determinants $()_4$.
But they contain yet the generic 4-point and (partly indexed) 3-point functions in higher dimensions, $I_4^{[d+],s}$, $I_3^{[d+],t}$, etc.

Last step: evaluate the $I_4^{[d+],s}$, $I_3^{[d+],t}$, etc. I

Several strategies are now possible:

- Just evaluate them analytically in $d + 2l - 2\epsilon$ dimensions – if you may do that

- Just evaluate them numerically in $d + 2l - 2\epsilon$ dimensions

- Reduce them further by recurrences – buy the towers of $1/()_4 \rightarrow$ apply (13)

- Make a small Gram determinant expansion $\rightarrow$ apply (13) another way round

Last two items are done here.

Reduction of scalars I_4^D to the generic dimension $\rightarrow I_4^d = D_0, I_3^d = C_0$ I

Non-small 4-point Gram determinants:

Direct, iterative use of (13) yields e.g.:

$$I_4^{[d+]^l} = \left[\frac{\binom{0}{0}_4}{()_4} I_4^{[d+]^{l-1}} - \sum_{t=1}^4 \frac{\binom{t}{0}_4}{()_4} I_3^{[d+]^{l-1},t} \right] \frac{1}{d+2l-5} \quad (20)$$

$$I_3^{[d+]^l,t} = \left[\frac{\binom{0t}{0t}_4}{\binom{t}{t}_4} I_3^{[d+]^{l-1},t} - \sum_{u=1,u\neq t}^4 \frac{\binom{ut}{0t}_4}{\binom{t}{t}_4} I_2^{[d+]^{l-1},tu} \right] \frac{1}{d+2l-4} \quad (21)$$

And we are done.

This works fine if $()_4$ is not small [and also the $\binom{t}{t}_4$].

Make a small Gram expansion I

Again use (13):

$$()_4 \left(d - \sum_{i=1}^{4} \nu_i + 1\right) I_4^{[d+]} = \left[\binom{0}{0}_4 I_4 - \sum_{k=1}^{4} \binom{0}{k}_4 I_3^k \right]$$

If $()_4 = 0$, then it follows ($n = 4$):

$$I_n^D = \sum_{k}^{n} \frac{\binom{0}{k}_n}{\binom{0}{0}_n} I_{n-1}^{D,k} \qquad (22)$$

If $()_4 << 1$, re-write (13), as follows:

$$I_n^D = \sum_{k}^{n} \frac{\binom{0}{k}_n}{\binom{0}{0}_n} I_{n-1}^{D,k} - \frac{()_n}{\binom{0}{0}_n} \left[(D+1) - \sum_{i}^{n} \nu_i \right] I_n^{D+2}. \qquad (23)$$

Effectively we may evaluate I_n^D in terms of simpler functions $I_{n-1}^{D,k}$ with a small correction depending on I_n^{D+2}.

We may go a step further, and insert into (23) for I_n^{D+2} the rhs. of (22), taken now at $D' = D + 2$:

$$
\begin{aligned}
I_n^D \;=\; & \sum_k^n \frac{\binom{0}{k}_n}{\binom{0}{0}_n} I_{n-1}^{D,k} \\
& - \frac{()_n}{\binom{0}{0}_n}[(D+1) - \sum_i^n \nu_i] \\
& \times \left[\sum_k^n \frac{\binom{0}{k}_n}{\binom{0}{0}_n} I_{n-1}^{D+2,k} - \frac{()_n}{\binom{0}{0}_n}[(D+3) - \sum_i^n \nu_i] I_n^{D+4} \right].
\end{aligned}
$$

The terms proportional to $[()_n/\binom{0}{0}_n]^a$, $a = 0, 1$ may be evaluated at the correct kinematics. They depend on three-point functions, and their reduction by normal recurrences will not introduce the unwanted powers of $1/()_4$. The last term, suppressed by the factor $[()_n/\binom{0}{0}_n]^2$, depends on I_n^{D+4}. It may either be taken approximately at $()_n = 0$, where it can also be represented by 3-point functions (and their reductions), or it may be evaluated more correctly by another iteration based on (22).

And so on and so on ...
In the numerical example – next section – we worked out up to 10 stable iterations.

A quite similar attempt to perform such a series of approximations was undertaken in [14] (see equation (5) there), where a specific example, forward light-by-light scattering through a massless fermion loop, was studied. The approach was then not further followed.

W. Giele, E. W. N. Glover, and G. Zanderighi,
in: Proceedings of Loops ans Legs 2004:
Numerical evaluation of one-loop diagrams near exceptional momentum configurations,

Following Davydychev, [7], one gets

$$I_4^{\mu\nu\lambda} = \int^d \frac{k^\mu k^\nu k^\lambda}{\prod_{r=1}^n c_r} = -\sum_{i,j,k=1}^n q_i^\mu q_j^\nu q_k^\lambda \nu_{ijk} I_{n,ijk}^{[d+]^3} + \frac{1}{2} \sum_{i=1}^n g^{[\mu\nu} q_i^{\lambda]} I_{n,i}^{[d+]^2} \quad (24)$$

We identify the tensor coefficients $D_{11\ldots}$ a la LoopTools, e.g.:

$$D_{111} = I_{4,222}^{[d+]^3} \quad (25)$$

Similarly:

$$D_{1111} = I_{4,2222}^{[d+]^4} \quad (26)$$

Rank $R = 4$ tensor D_{1111} – Numerics with dimensional recurrences

From (23) we see that a "small Gram determinant" expansion will be useful when the following dimensionless parameter becomes small:

$$R = \frac{()_4}{\binom{0}{0}_4} \times s, \qquad (27)$$

where s is a typical scale of the process, e.g. we will choose $s = s_{\mu\bar{\nu}u}$.
Following [12], we further choose:

$$s_{\mu\bar{\nu}u} = 2 \times 10^4 \text{GeV}^2,$$
$$s_{\bar{\nu}u} = 1 \times 10^4 \text{GeV}^2,$$
$$t_{\bar{e}\mu} = -4 \times 10^4 \text{GeV}^2,$$

and get $t_{ed,\text{crit}} = -6 \times 10^4 \text{GeV}^2$. For $x=1$, the Gram determinant becomes $()_4 = 4.8 \times 10^{13} \text{ GeV}^3$.
The small expansion parameter $R(x)$ and D_{1111} are shown in figure 2.

New for QCD at LHC: small Gram expansion and Pade approximation I

[Fleischer,TR: PRD 2011 [6]]

Tables have been taken from there.

They were shown already at QCD@LHC@Trento2010

The use of appropriate Pade approximations is explained there.
Convergence in the small Gram determinant region is
considerably improved.

  "One loop tensor reduction program PJFRY"

PJFry - an open source c++ program by V. Yundin II

- Yundin's PhD thesis, submitted Aug 2011 at Humboldt University

## **PJFry** — numerical package [from V.Y. Valencia 2011] I

Numerical implementation of described algorithms:
C++ package **PJFry** by V. Yundin [see project webpage]

- Reduction of **5-point** 1-loop tensor integrals up to **rank 5**

- No limitations on internal/external masses combinations

- Small Gram determinants treatment by expansion

- Interfaces for C, C++, FORTRAN and MATHEMATICA

Example:
Relative accuracy of E_{3333} coef. around small Gram4 region

PJFry — small Gram region example [from V.Y. Valencia 2011] I

Example: E_{3333} coefficient in small Gram region ($x = 0$)

Comparison of Regular and Expansion formulae:

$x{=}0$: $E_{3333}(0, 0, -6{\times}10^4, 0, 0, 10^4, -3.5{\times}10^4, 2{\times}10^4, -4{\times}10^4, 1.5{\times}10^4, 0, 6550, 0, 0, 8315)$

PJFry

An application of PJFry to

$$e^+ e^- \rightarrow \mu^+ \mu^- \gamma$$

at meson factories will be presented in the talk by Janusz Gluza.

Due to the specific cuts of the experiments, the numerics is relatively unstable.

Contractions with external momenta [or with CHORDS] I

[Fleischer,TR: PLB 2011 [11]]
After having tensor reductions with basis functions I_n^D,
which are independent of the indices $i, j, k, ...$,
one may use contractions with external momenta in order to perform
all the sums over $i, j, k, ...$.
This leads to a significant simplification and shortening of
calculations.
Reminder:
One option was to avoid the appearance of inverse Gram
determinants $1/()_5$. For rank $R = 5$, e.g.,

$$I_5^{\mu\nu\lambda\rho\sigma} = \sum_{s=1}^{5} \left[\sum_{i,j,k,l,m=1}^{5} q_i^\mu q_j^\nu q_k^\lambda q_l^\rho q_m^\sigma E_{ijklm}^s + \sum_{i,j,k=1}^{5} g^{[\mu\nu} q_i^\lambda q_j^\rho q_k^{\sigma]} E_{00ijk}^s \right.$$

$$\left. + \sum_{i=1}^{5} g^{[\mu\nu} g^{\lambda\rho} q_i^{\sigma]} E_{0000i}^s \right] \tag{28}$$

Contractions with external momenta [or with CHORDS] I

The tensor coefficients are expressed in terms of integrals $I_{4,i\cdots}^{[d+]^l,s}$, e.g.:

$$E_{ijklm}^s = -\frac{1}{\binom{0}{0}_5} \left\{ \left[\binom{0l}{sm}_5 n_{ijk} I_{4,ijk}^{[d+]^4,s} + (i \leftrightarrow l) + (j \leftrightarrow l) + (k \leftrightarrow l) \right] \right.$$
$$\left. + \binom{0s}{0m}_5 n_{ijkl} I_{4,ijkl}^{[d+]^4,s} \right\}.$$

Now, in a next step, one may avoid the appearance of inverse sub-Gram determinants $()_4$.
The complete dependence on the indices i of the tensor coefficients is contained now in the pre-factors with signed minors. One can say that the indices *decouple* from the integrals.
As an example, we reproduce the 4-point part of

$$n_{ijkl} I_{4,ijkl}^{[d+]^4} = \frac{\binom{0}{i}\binom{0}{j}\binom{0}{k}\binom{0}{l}}{\binom{0}{0}\binom{0}{0}\binom{0}{0}\binom{0}{0}} d(d+1)(d+2)(d+3) I_4^{[d+]^4}$$

$$+ \frac{\binom{0i}{0j}\binom{0}{k}\binom{0}{l} + \binom{0i}{0k}\binom{0}{j}\binom{0}{l} + \binom{0i}{0l}\binom{0}{j}\binom{0}{k} + \binom{0j}{0k}\binom{0}{i}\binom{0}{l} + \binom{0j}{0l}\binom{0}{i}\binom{0}{k} + \binom{0k}{0l}\binom{0}{i}\binom{0}{j}}{\binom{0}{0}^3} d(d+1) I_4^{[d+]^3}$$

$$+ \frac{\binom{0i}{0l}\binom{0j}{0k} + \binom{0j}{0l}\binom{0i}{0k} + \binom{0k}{0l}\binom{0i}{0j}}{\binom{0}{0}^2} I_4^{[d+]^2} + \cdots$$

(29)

] ||

Contractions with external momenta [or with CHORDS]

In (29), one has to understand the 4-point integrals to carry the corresponding index s and the signed minors are $\binom{0}{k} \rightarrow \binom{0s}{ks}_5$ etc.

Contractions with external momenta [or with CHORDS] I

A chord is the momentum shift of an internal line due to external momenta, $D_i = (k - q_i)^2 - m_i^2 + i\epsilon$, and $q_i = (p_1 + p_2 + + p_i)$, with $q_n = 0$.

The tensor 5-point integral of rank $R = 1$ yields, when contracted with a chord,

$$q_{a\mu} I_5^\mu = -\frac{1}{\binom{0}{0}_5} \sum_{s=1}^{5} \left[\sum_{i=1}^{4} (q_a \cdot q_i) \binom{0i}{0s}_5 \right] I_4^s. \tag{30}$$

In fact, the sum over i may be performed explicitly:

$$\Sigma_a^{1,s} \equiv \sum_{i=1}^{4} (q_a \cdot q_i) \binom{0s}{0i}_5 = +\frac{1}{2} \left\{ \binom{s}{0}_5 (Y_{a5} - Y_{55}) + \binom{0}{0}_5 (\delta_{as} - \delta_{5s}) \right\},$$

Contractions with external momenta I

We get immediately

$$q_{a\mu} I_5^\mu = - \frac{1}{\binom{0}{0}_5} \sum_{s=1}^5 \Sigma_a^{1,s} \ I_4^s. \tag{31}$$

Contractions with external momenta I

The tensor 5-point integral of rank $R = 2$

$$I_5^{\mu\nu} = \sum_{i,j=1}^{4} q_i^\mu q_j^\nu E_{ij} + g^{\mu\nu} E_{00}, \tag{32}$$

has the following tensor coefficients free of $1/()_5$:

$$E_{00} = -\sum_{s=1}^{5} \frac{1}{2} \frac{1}{\binom{0}{0}_5} \binom{s}{0}_5 I_4^{[d+],s}, \tag{33}$$

$$E_{ij} = \sum_{s=1}^{5} \frac{1}{\binom{0}{0}_5} \left[\binom{0i}{sj}_5 I_4^{[d+],s} + \binom{0s}{0j}_5 I_{4,i}^{[d+],s} \right]. \tag{34}$$

Contractions with external momenta I

Equation (32) yields for the contractions with chords:

$$q_{a\mu} q_{b\nu} I_5^{\mu\nu} = \sum_{i,j=1}^{4} (q_a \cdot q_i)(q_b \cdot q_j) E_{ij} + (q_a \cdot q_b) E_{00}. \tag{35}$$

and finally (35) simply reads

$$
\begin{aligned}
q_{a\mu} q_{b\nu} I_5^{\mu\nu} = & \ \frac{1}{4} \sum_{s=1}^{5} \left\{ \frac{\binom{s}{0}_5}{\binom{0s}{0s}_5} (\delta_{ab}\delta_{as} + \delta_{5s}) + \frac{\binom{s}{s}_5}{\binom{0s}{0s}_5} \left[(\delta_{as} - \delta_{5s})(Y_{b5} - Y_{55}) \right. \right. \\
& \left. \left. + (\delta_{bs} - \delta_{5s})(Y_{a5} - Y_{55}) + \frac{\binom{s}{0}_5}{\binom{0}{0}_5}(Y_{a5} - Y_{55})(Y_{b5} - Y_{55}) \right] \right\} I_4^{[d+],s} \\
& + \frac{1}{\binom{0}{0}_5} \sum_{s=1}^{5} \frac{\Sigma_b^{1,s}}{\binom{0s}{0s}_5} \sum_{t=1}^{5} \Sigma_a^{2,st} I_3^{st},
\end{aligned}
$$

Contractions with external momenta I

with

$$\Sigma_a^{2,st} \equiv \sum_{i=1}^{4} (q_a \cdot q_i) \begin{pmatrix} 0st \\ 0si \end{pmatrix}_5$$

$$= \frac{1}{2} (1 - \delta_{st}) \left\{ \begin{pmatrix} ts \\ 0s \end{pmatrix}_5 (Y_{a5} - Y_{55}) + \begin{pmatrix} 0s \\ 0s \end{pmatrix}_5 (\delta_{at} - \delta_{5t}) - \begin{pmatrix} 0s \\ 0t \end{pmatrix}_5 (\delta_{as} - \delta_{5s}) \right.$$

This has been extended also to higher ranks.

We need at most double sums, e.g.:

$$\Sigma_{ab}^{2,s} \equiv \sum_{i,j=1}^{4} (q_a \cdot q_i)(q_b \cdot q_j) \begin{pmatrix} si \\ sj \end{pmatrix}_5 \frac{1}{2} (q_a \cdot q_b) \begin{pmatrix} s \\ s \end{pmatrix}_5$$

$$= -\frac{1}{4} ()_5 (\delta_{ab}\delta_{as} + \delta_{5s}), \qquad (36)$$

Contractions with external momenta I

Many of the sums over signed minors, weighted with scalar products of chords are given in PLB 2011 [[11]], and an almost complete list may be obtained on request from J. Fleischer, T.R.

Modifications for 7- and higher point functions I

Here, the Gram determinant vanishes, and also further determinants:

$()_n = 0, n > 5$

but also $\binom{0}{k}_7 = 0$

As a result, one has to reorganize the reductions, avoiding the $1/()_n$ completely.

This may be done, and we are coming so far to expressions with $I_6^{[d+]}$.

The problematic case is the integral $I_{6,i}^{[d+]}$ for which we can write

$$I_{6,i}^{[d+]} = \sum_{s=1, s \neq i}^{7} \frac{\binom{R}{s}_6}{\binom{R}{0}_6} I_{5,i}^{[d+],s} + \frac{\binom{R}{i}_6}{\binom{R}{0}_6} I_6^{[d+]}.$$

Modifications for 7- and higher point functions II

For $I_6^{[d+]}$ we finally need 4-point functions up to the order ϵ in the basis.

But:
We know from Gudrun Heinrich et al. that there is a representation in terms just of ordinary 4-point functions:

Binoth, Guillet, Heinrich, hep-ph/0504267, hep-ph/9911342

$n > 6$: assumption in Bern,Dixon,Kosower, hep-ph/9306240

Summary

- Recursive treatment of hexagon and pentagon tensor integrals of rank R in terms of pentagons and boxes of rank $R - 1$

- Systematic derivation of expressions which are explicitely free of inverse Gram determinants $()_5$ until pentagons of rank $R = 5$

- Proper isolation of inverse Gram determinants of subdiagrams of the type $\binom{s}{s}_n 4$, which cannot be completely avoided

- Numerical C++ package PJFry (V. Yundin, open source) for C, c++, Mathematica, Fortran

- Perform multiple sums with signed minors and scalar products after contractions with chords or external momenta
