#### **Small Extra Dimensions**

- A model with a large compactification radius is not stable – the hierarchy problem returns in a different garb.
- An attempt to solve the hierarchy problem without introducing a large compactification radius – the model of Randall and Sundrum.
- In this 5-d model, the fifth dimension y of a small radius  $R_c$  is compactified on a  $S^1/Z^2$  orbifold in an AdS spacetime.

## Warped Model

- Two branes are at the orbifold fixed points: a Planck brane at y = 0 and a TeV brane at  $y = \pi$ .
- The model uses a warped metric

$$ds^{2} = e^{-KR_{c}y}\eta_{\mu\nu}dx^{\mu}dx^{\nu} + R_{c}^{2}dy^{2}.$$
 (1)

where K is a mass scale related to the curvature.

# **Warped suppressions**

- The warp factor acts as a conformal factor for fields on the brane.
- The term  $\exp(-KR_c y)$  for the TeV brane at  $y = \pi$  generates a factor of  $10^{15}$  by an exponent of order 30 and solves the hierarchy problem.
- Problem: Mass scales that suppress higher dimensional operators inducing proton decay or neutrino masses also get rescaled.

# **Gauge-Gravity Correspondence**

- Dual nature of branes has profound consequences.
- On the one hand, branes localise open strings and yield a SUSY gauge theory.
- On the other, branes are solitonic solutions of supergravity theories.
- Suggestive of a deep connection between the gravity and gauge aspects.

• AdS/CFT posits a duality between: Type IIB String Theory on  $AdS_5 \times S^5$  with string coupling  $g_s$ , radius R and N units of five-form flux  $\tilde{F}_5$  through  $S_5$ Superconformal  $\mathcal{N} = 4$  SU(N) 4D gauge theory with coupling  $g_{YM}$ . with

$$g_{YM}^2 = 4\pi g_s \tag{2}$$

$$\frac{R_{AdS}^4}{l_s^4} = 4\pi g_s N$$

(3)

#### Weaker forms of AdS/CFT

- Quantisation of strings on a curved space like  $AdS_5 \times S^5$  is intractable.
- Take the 't Hooft limit:  $N \to \infty$ ,  $\lambda \equiv g_{YM}^2 N$  fixed. This is the classical string limit  $g_s \to 0$ .
- Strong coupling limit:  $\lambda \to \infty$  which corresponds to  $l_s \to 0$  which gives low-energy supergravity on  $AdS_5 \times S^5$ .

#### **More on AdS/CFT**

- Upshot: The RS model is dual to a 4-d theory which is strongly coupled.
- The dual theory is conformally invariant down to the TeV scale and the invariance is broken by the TeV brane.
- Distance from the TeV brane determines the compositeness or elementarity of the 5D fields.
- Since all the SM fields are localised on the TeV brane, the RS theory is dual to a theory of TeV-scale compositeness.

# **Exploring the Bulk**

- The way out is to localise only the Higgs on the brane – composite Higgs.
- Localise zero modes paying attention to flavour hierarchy, EW precision tests and avoidance of FCNCs.
- S parameter is handled by having the fermions in the bulk but a custodial  $SU(2)_L \times SU(2)_R \times U(1)_{(B-L)}$  symmetry is required for the *T* parameter.

## **Locating the fermions**

- To get a large Yukawa coupling i.e. overlap with the Higgs one needs to localise the fermion close to the TeV brane and far away from the brane to get a small Yukawa.
- The top sector: the doublet needs to be as far away from the TeV brane as allowed by R<sub>b</sub> whereas the t<sub>R</sub> needs to be close to the TeV brane to get the large Yukawa of the top.
- FCNCs and precision electroweak tests  $\implies$  KK gauge bosons masses  $\sim$  2-3 TeV.

# KK gluons

- Interesting signal KK gluon production.
- The KK gluon coupling to  $t_R$  is enhanced by a factor  $\xi$  compared to  $\alpha_s$  where  $\xi \equiv \sqrt{\log(M_{pl}/\text{TeV})} \sim 5.$
- Consequently, it decays predominantly to tops if produced.
- To the  $(t, b)_L$  doublet its coupling is  $\alpha_s$ .
- To the light quarks its couplings are suppressed by a factor  $1/\xi$ .

## **KK Gluon Production**

- However, the  $ggg_{KK}$  vanishes because of the the orthogonality of the profiles of these particles.
- So gg initial state does not contribute, only  $q\bar{q}$  does. The has been studied in the context of the LHC and Tevatron.

# **KK gluon at NLO**

- It is interesting to look at the NLO production coming from gg initial states.
- We have completed a full calculation including sub-leading terms coming from KK gluon loops.

#### **Quark Loops**

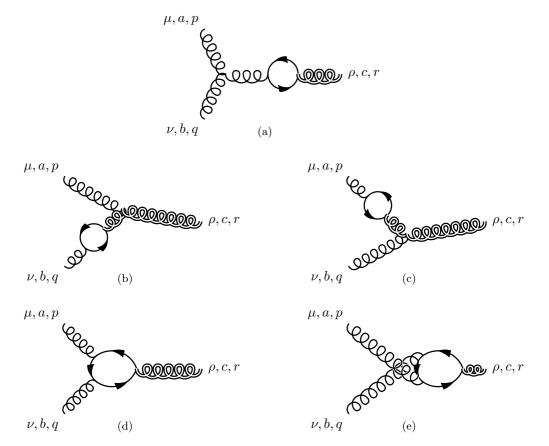

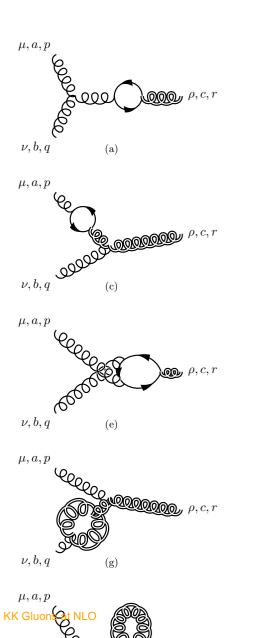

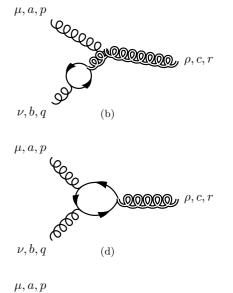

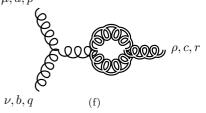

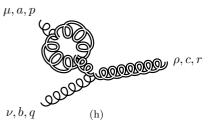

Figure 2: Feynman diagrams for the process that involve a quark in the loop.

# **KK gluon loops**

### **Ghost loops**

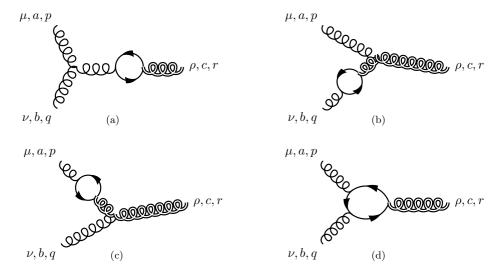

Figure 2: Feynman diagrams for the process that involve a Kaluza-Klein ghost in the loop.

#### Calculation

• The general form of the amplitude  $F^{\mu\nu\rho}$ , consistent with current conservation (related to the incoming massless gluons) is:

$$F_{\mu\nu\rho} = A \left( \eta_{\mu\nu} p \cdot q - q_{\mu} p_{\nu} \right) p_{\rho} + B \epsilon_{\mu\nu\gamma\delta} p^{\gamma} q^{\delta} p_{\rho} + C \left( \epsilon_{\mu\nu\rho\gamma} p^{\gamma} p \cdot q - \epsilon_{\mu\rho\gamma\delta} p^{\gamma} q^{\delta} p_{\nu} \right) + D \left( \epsilon_{\mu\nu\rho\gamma} q^{\gamma} p \cdot q - \epsilon_{\nu\rho\gamma\delta} p^{\gamma} q^{\delta} q_{\mu} \right), \quad (4)$$

where A, B, C and D are constants.

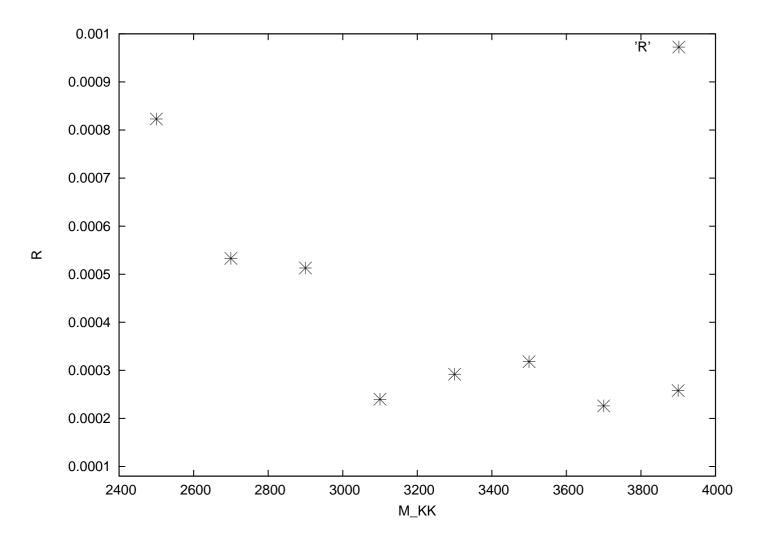

$$|\mathcal{M}|^{2} = \frac{M_{KK}^{6} g^{4}}{(4\pi)^{4}} \left| \frac{4046}{16384} g^{(111)^{2}} \left[ I(M_{KK}, M_{KK}) \right]^{2} - \frac{51}{256} g^{(111)} \sum_{q_{L}, q_{R}} g^{(1q)} \left[ I(M_{KK}, M_{KK}) I(m_{q}, M_{KK}) \right] + \frac{3}{64} \left[ \sum_{q_{L}, q_{R}} g^{(1q)} I(m_{q}, M_{KK}) \right]^{2} \right|,$$
(5)

$$I(a,b) = \int_0^1 dx \int_0^{1-x} \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 dx \int_0^{1-x} \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 dx \int_0^{1-x} \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 dx \int_0^{1-x} \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 dx \int_0^{1-x} \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 dx \int_0^{1-x} \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 dx \int_0^{1-x} \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 dx \int_0^1 \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO} = \int_0^1 \frac{xy(1-x-y)}{a^2 - xyb^2} - KK \text{ Gluons at NLO}$$

Sridhar K. – p. 18

(6)

# Conclusions

- The RS model with all SM fields localised on the TeV brane is inconsistent.
- The Bulk RS model, with gauge bosons and fermions localised in the bulk replaces the original model.
- KK gluon production is the most important signal of the Bulk RS model.
- The gluon-initiated contribution to KK gluon production at NLO in QCD is computed and is found to be small.
