

Transfer of the CMS Experiment Underground Part-2

A. Hervé / CERN

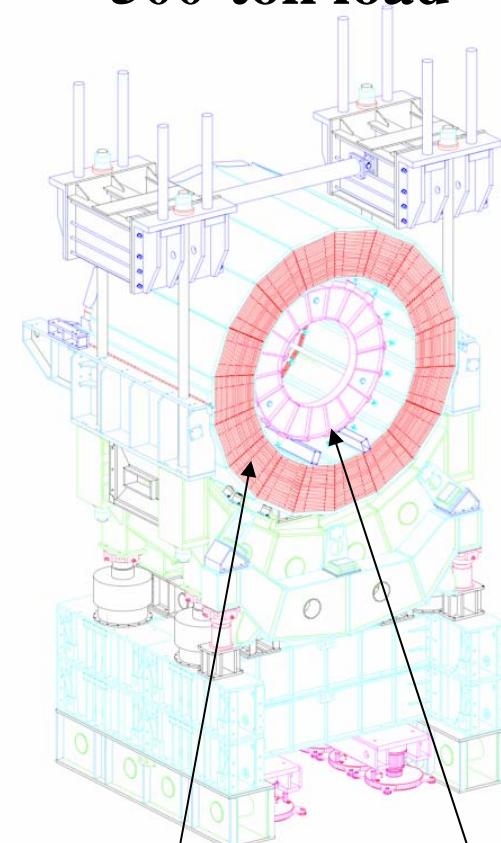

Lowering of the CMS detector into UXC55

Total of 15 loads from 300 to 2000 tons

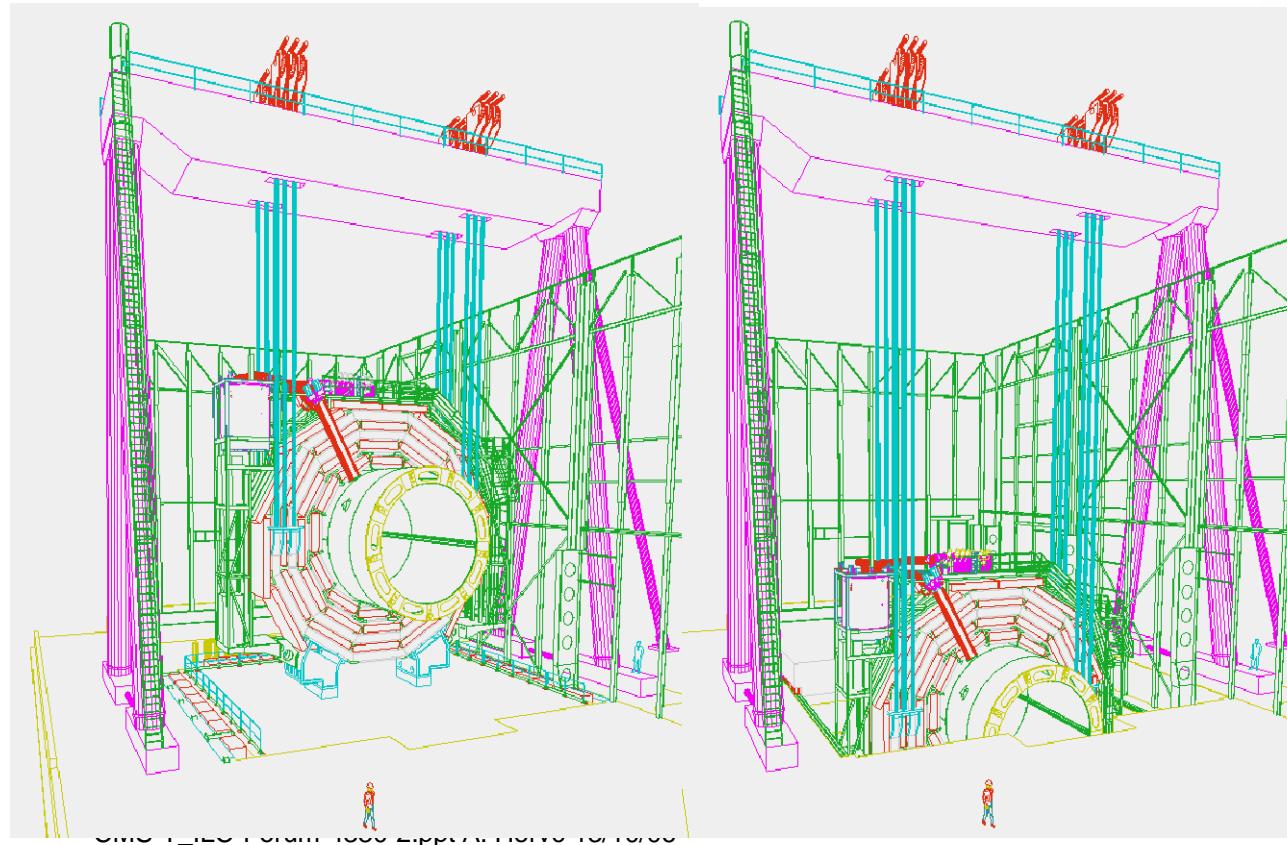

Detector lowering is part of the CMS basic concept.
Last certification tests of gantry in preparation
Lead Engineer for the operation is Hubert Gerwig.

500-ton load

2000-ton load

2

Transfer Underground

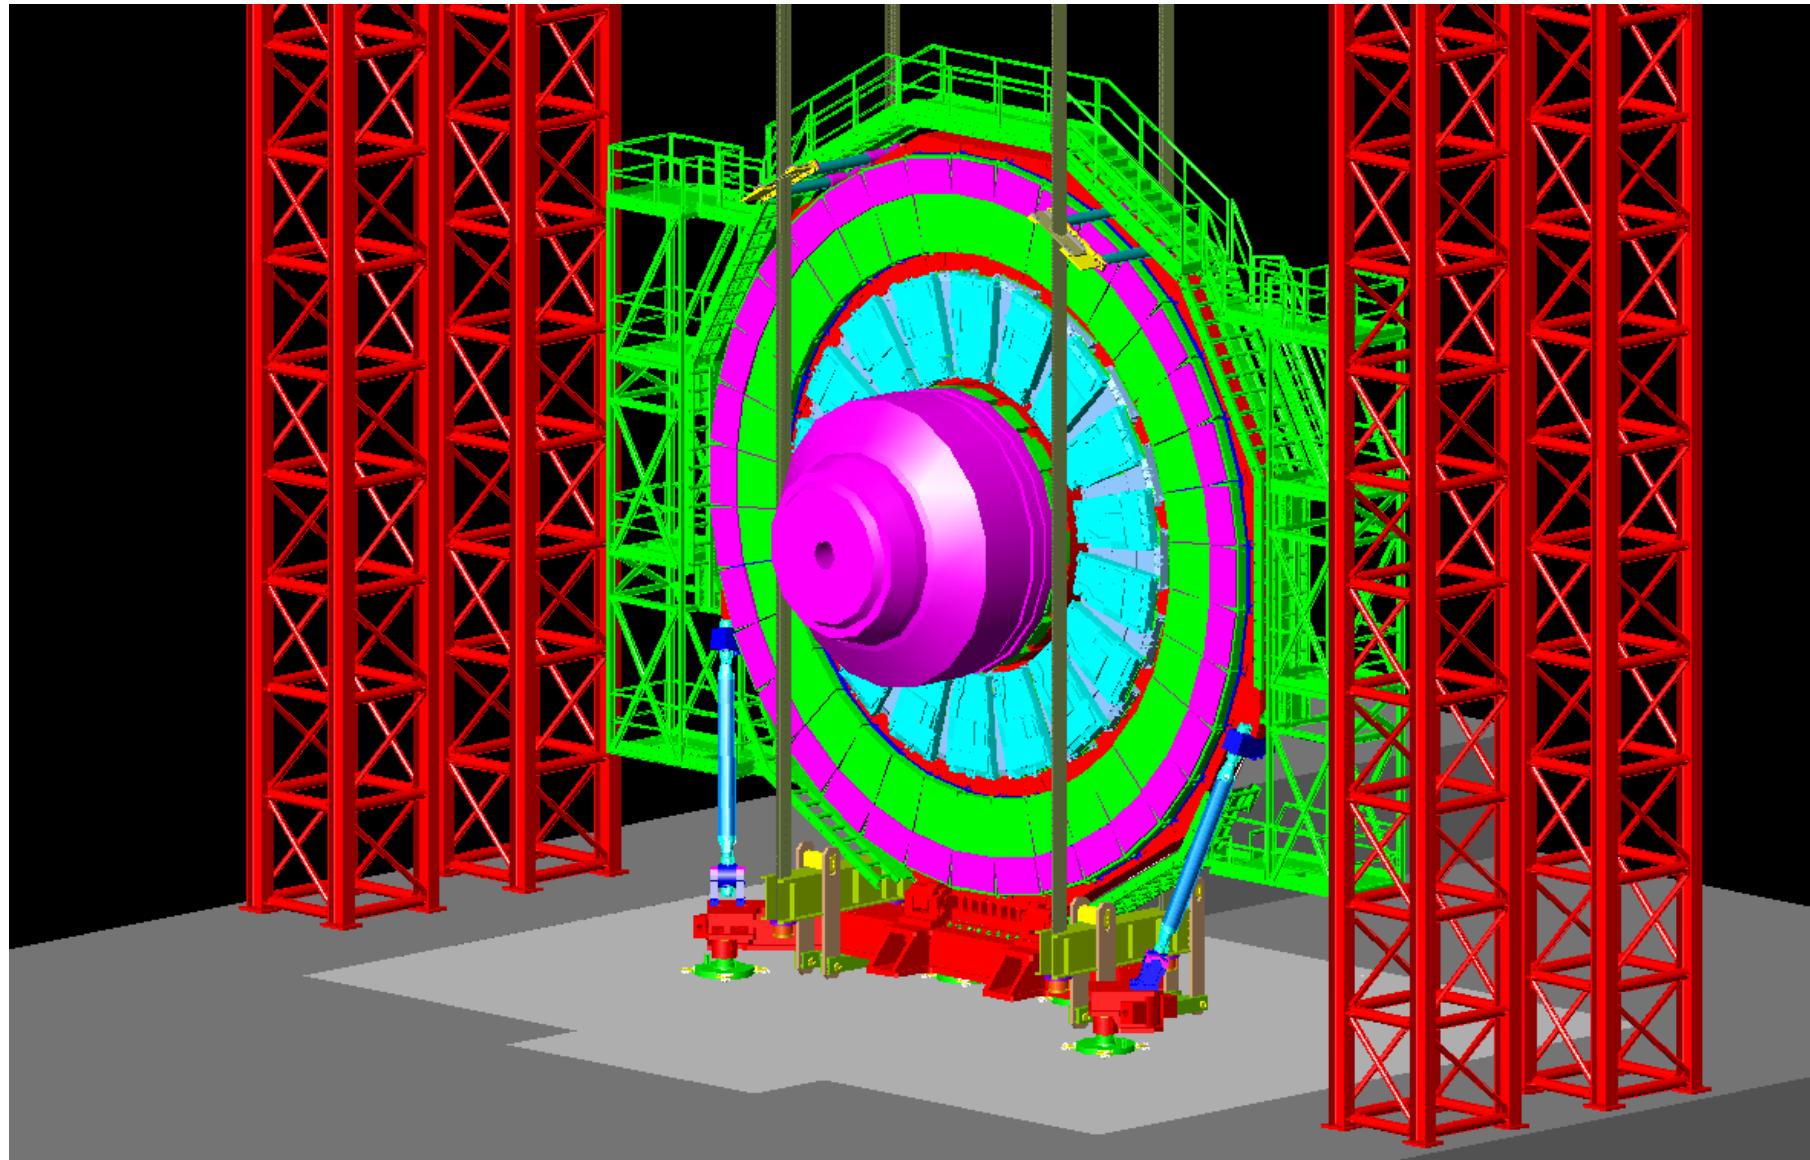

All detector elements move on the same air pad-system as used in the surface hall.

Hcal barrel moving in SX5
on the air pad system.

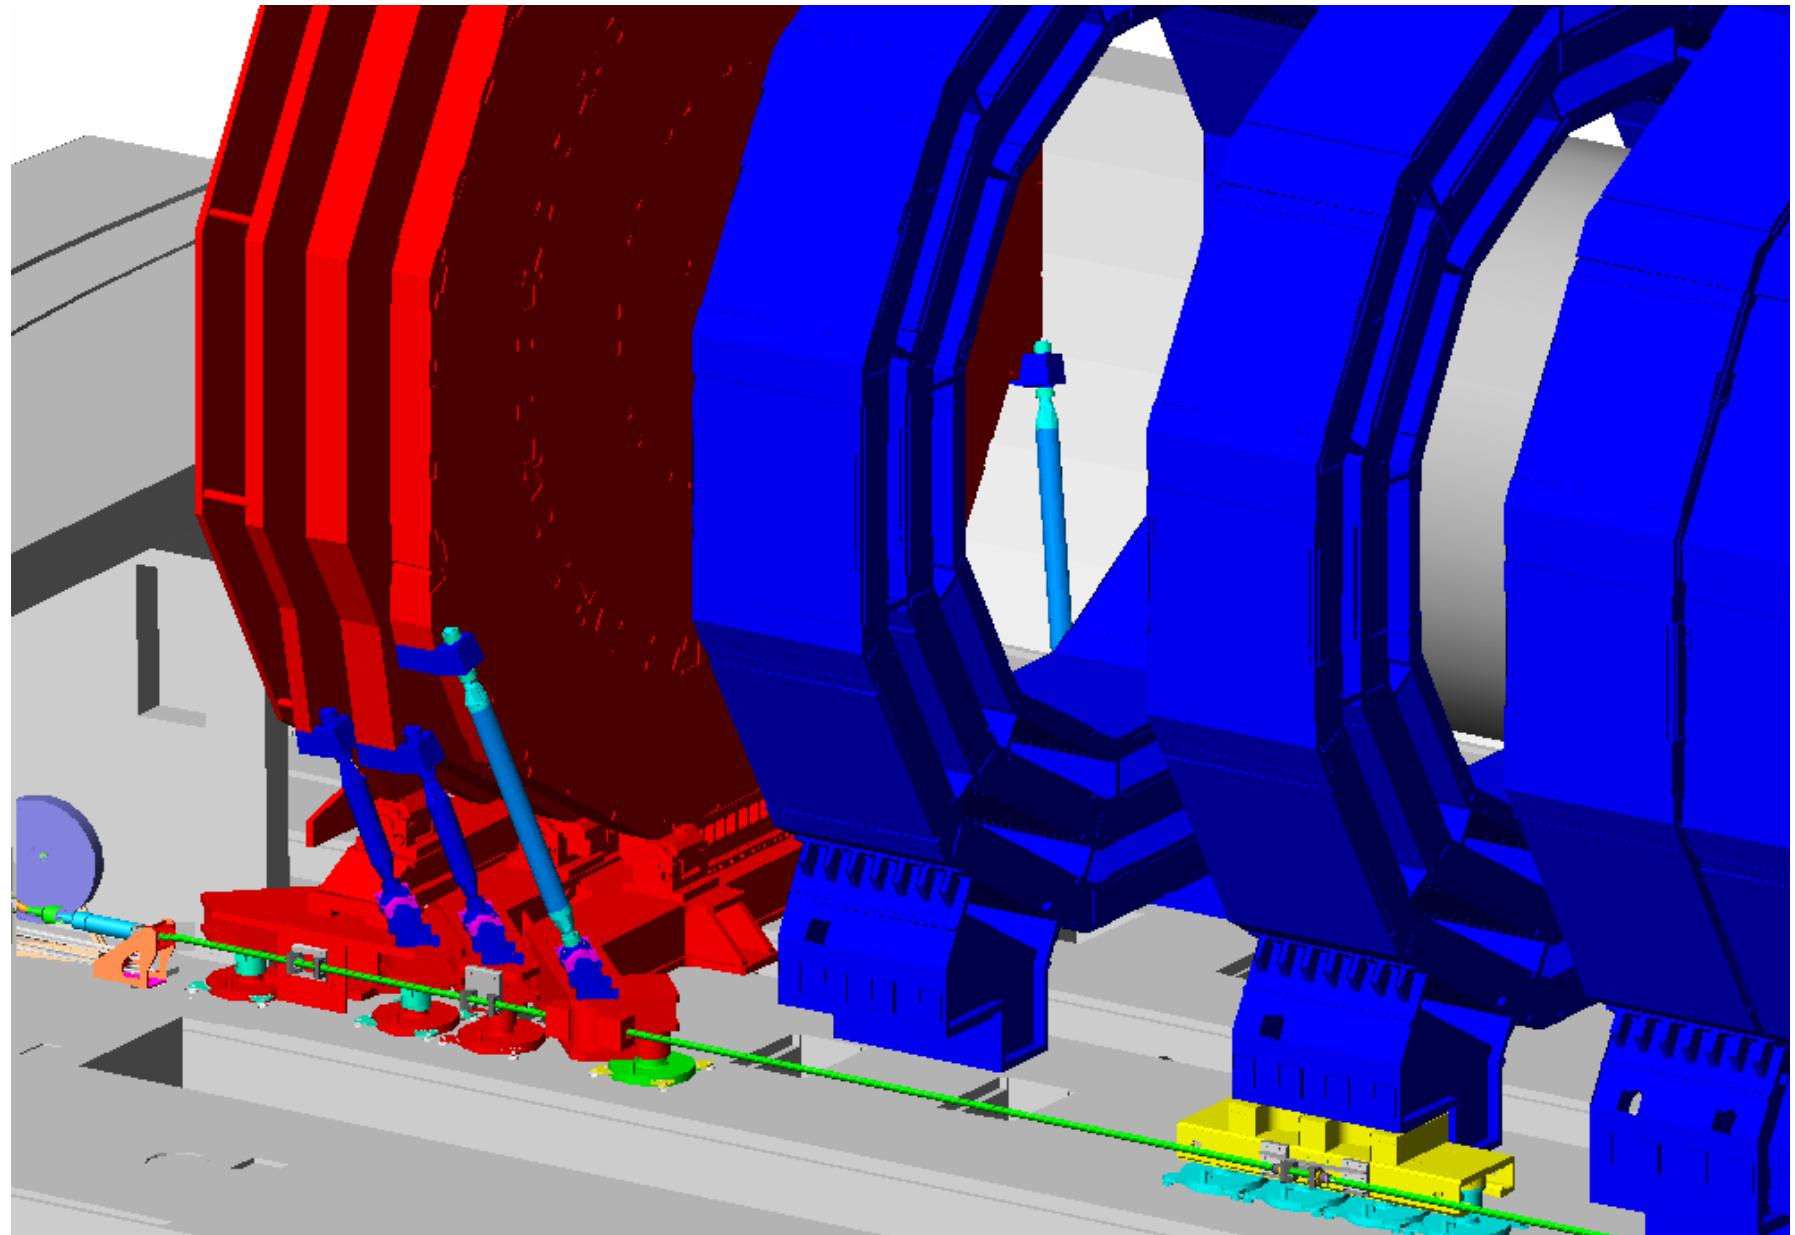

Transfer Underground of YE+1

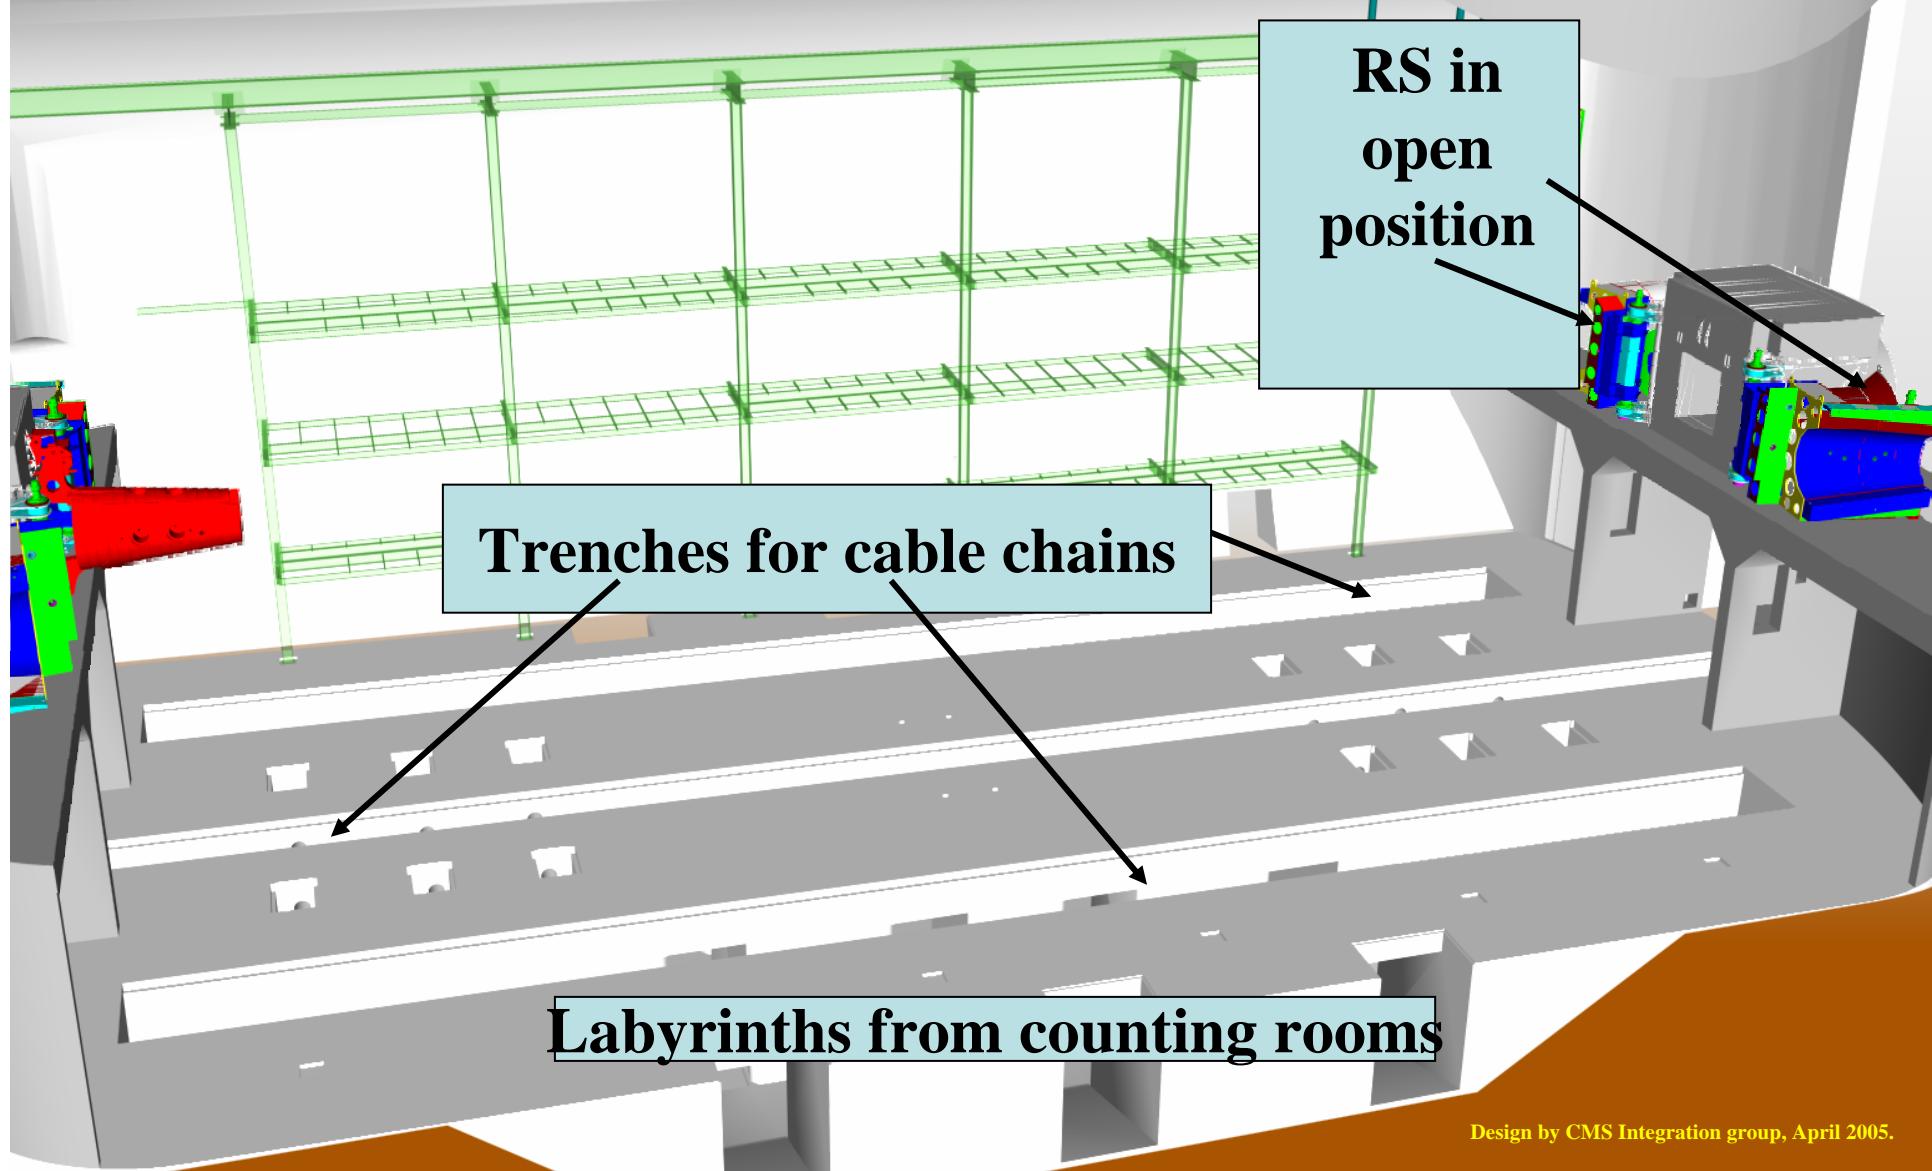

Movement Underground

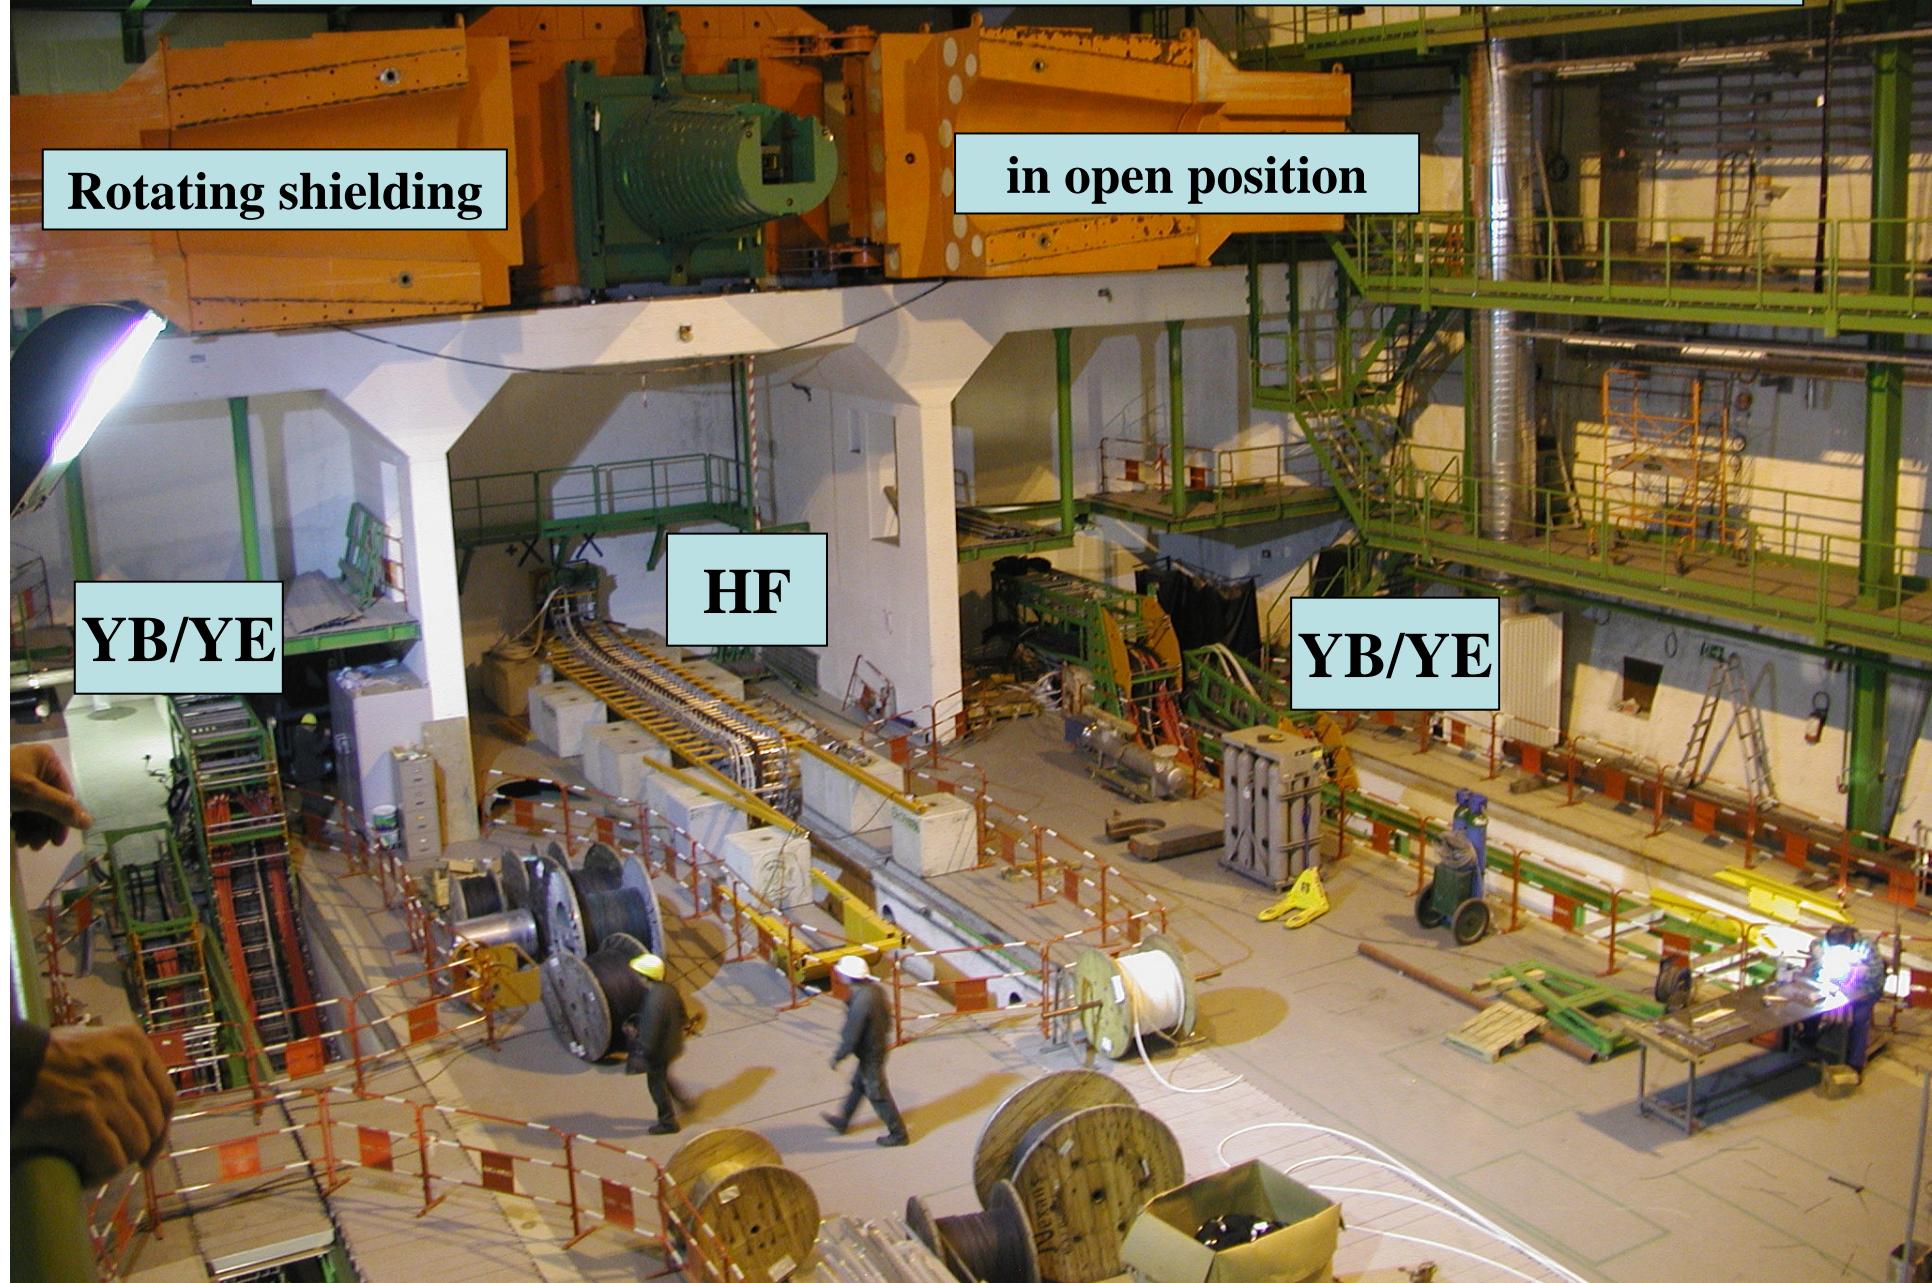

UX5 Ready to receive Elements

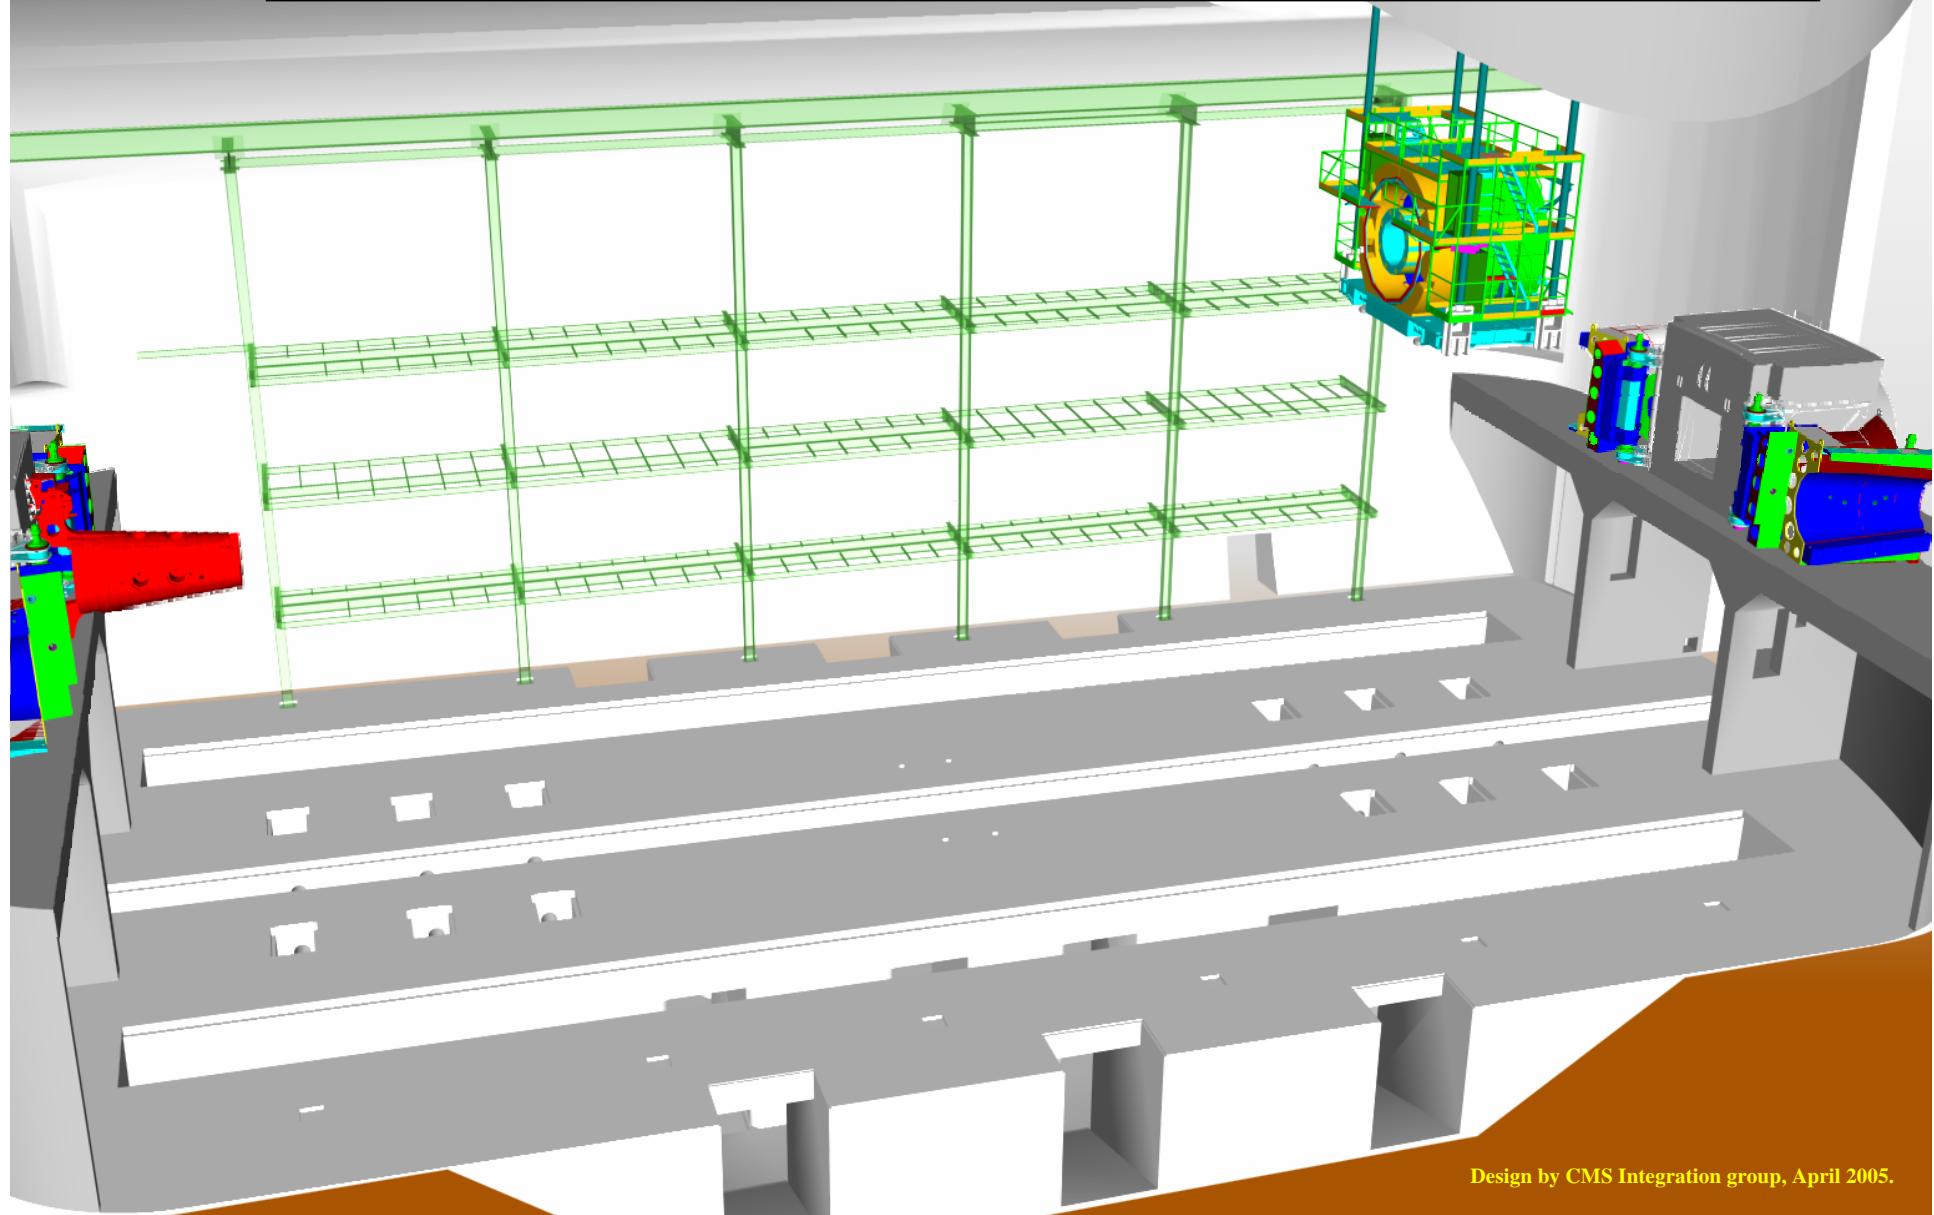

The cave below is used as dispatching center

Situation 2 weeks ago

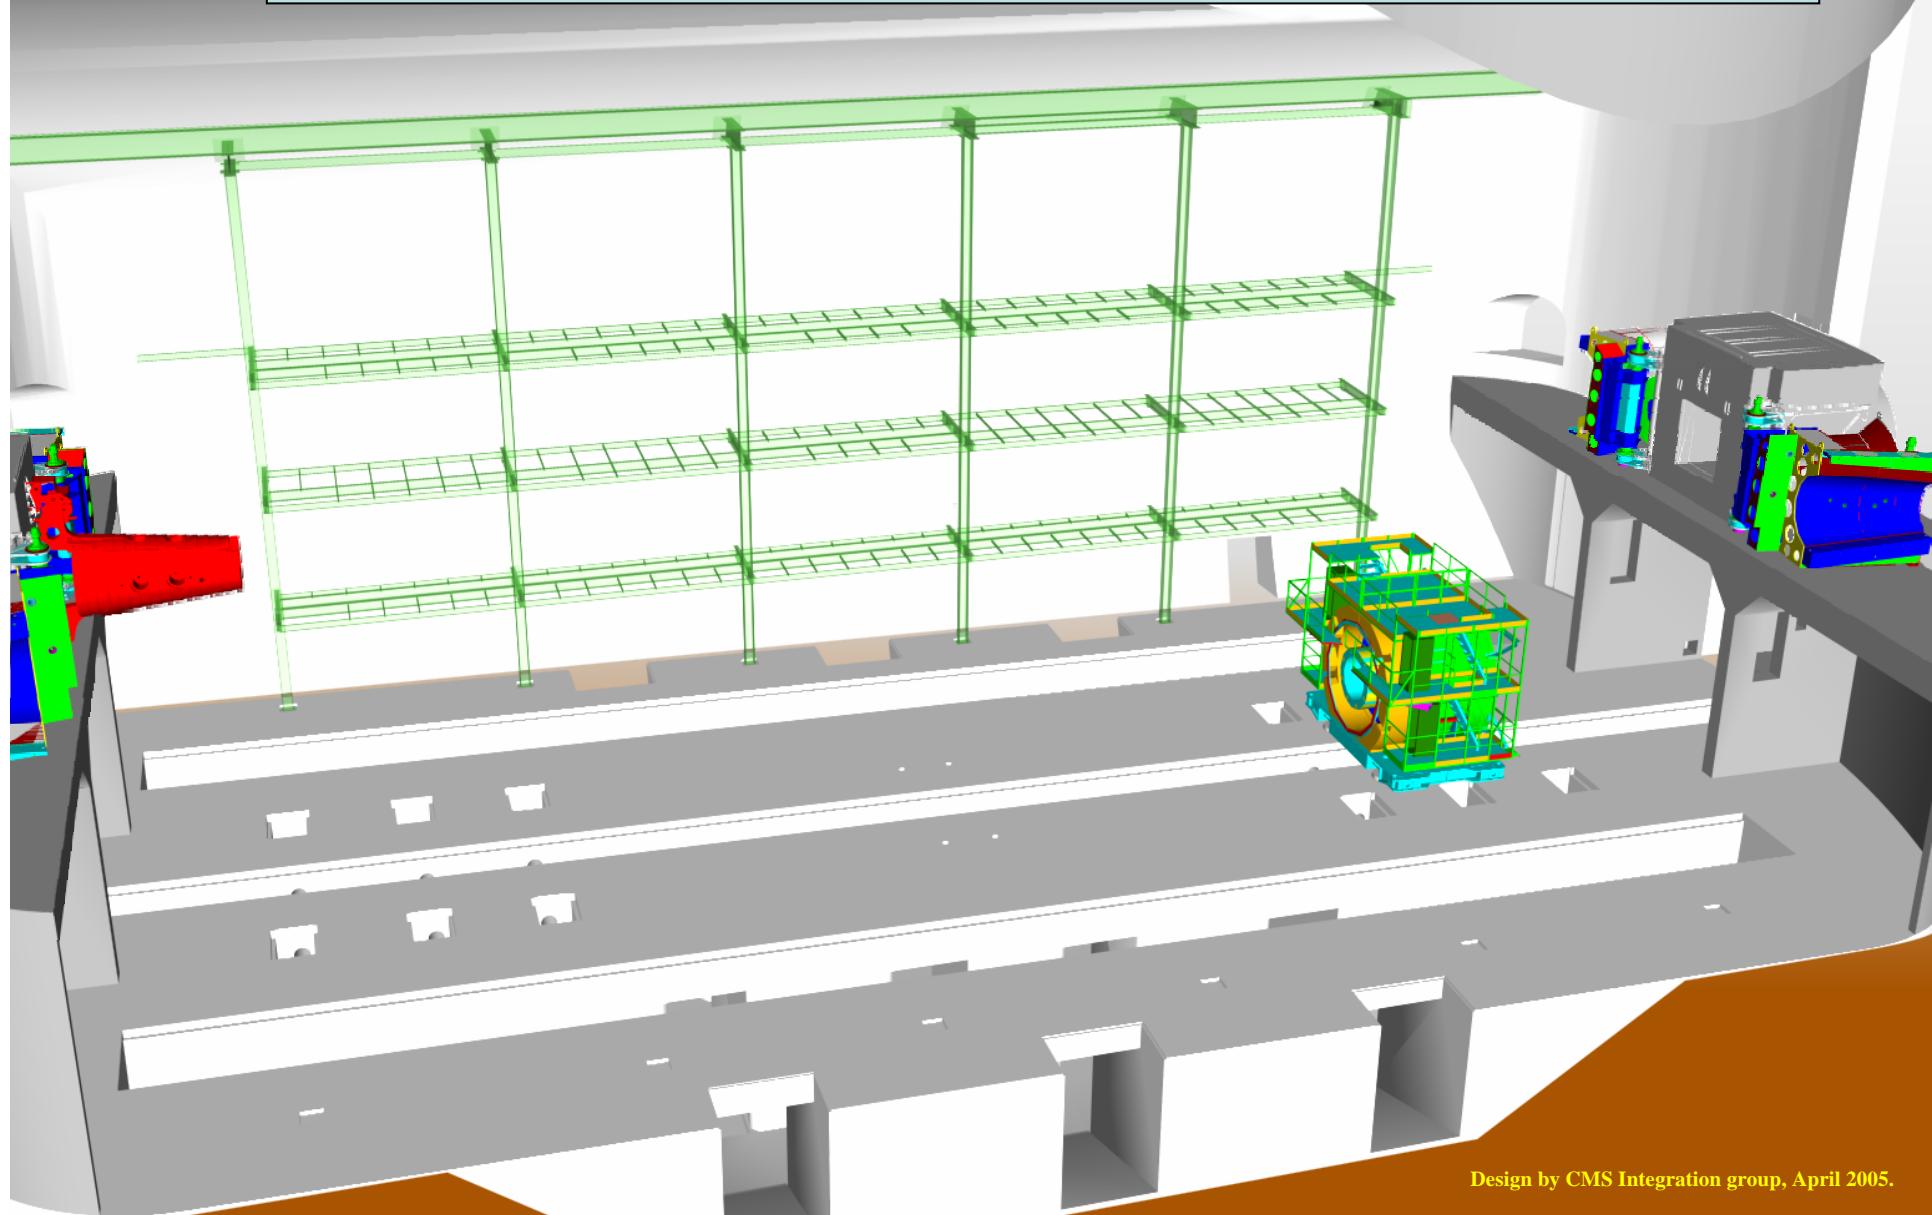

Lower HF Z+ move into garage

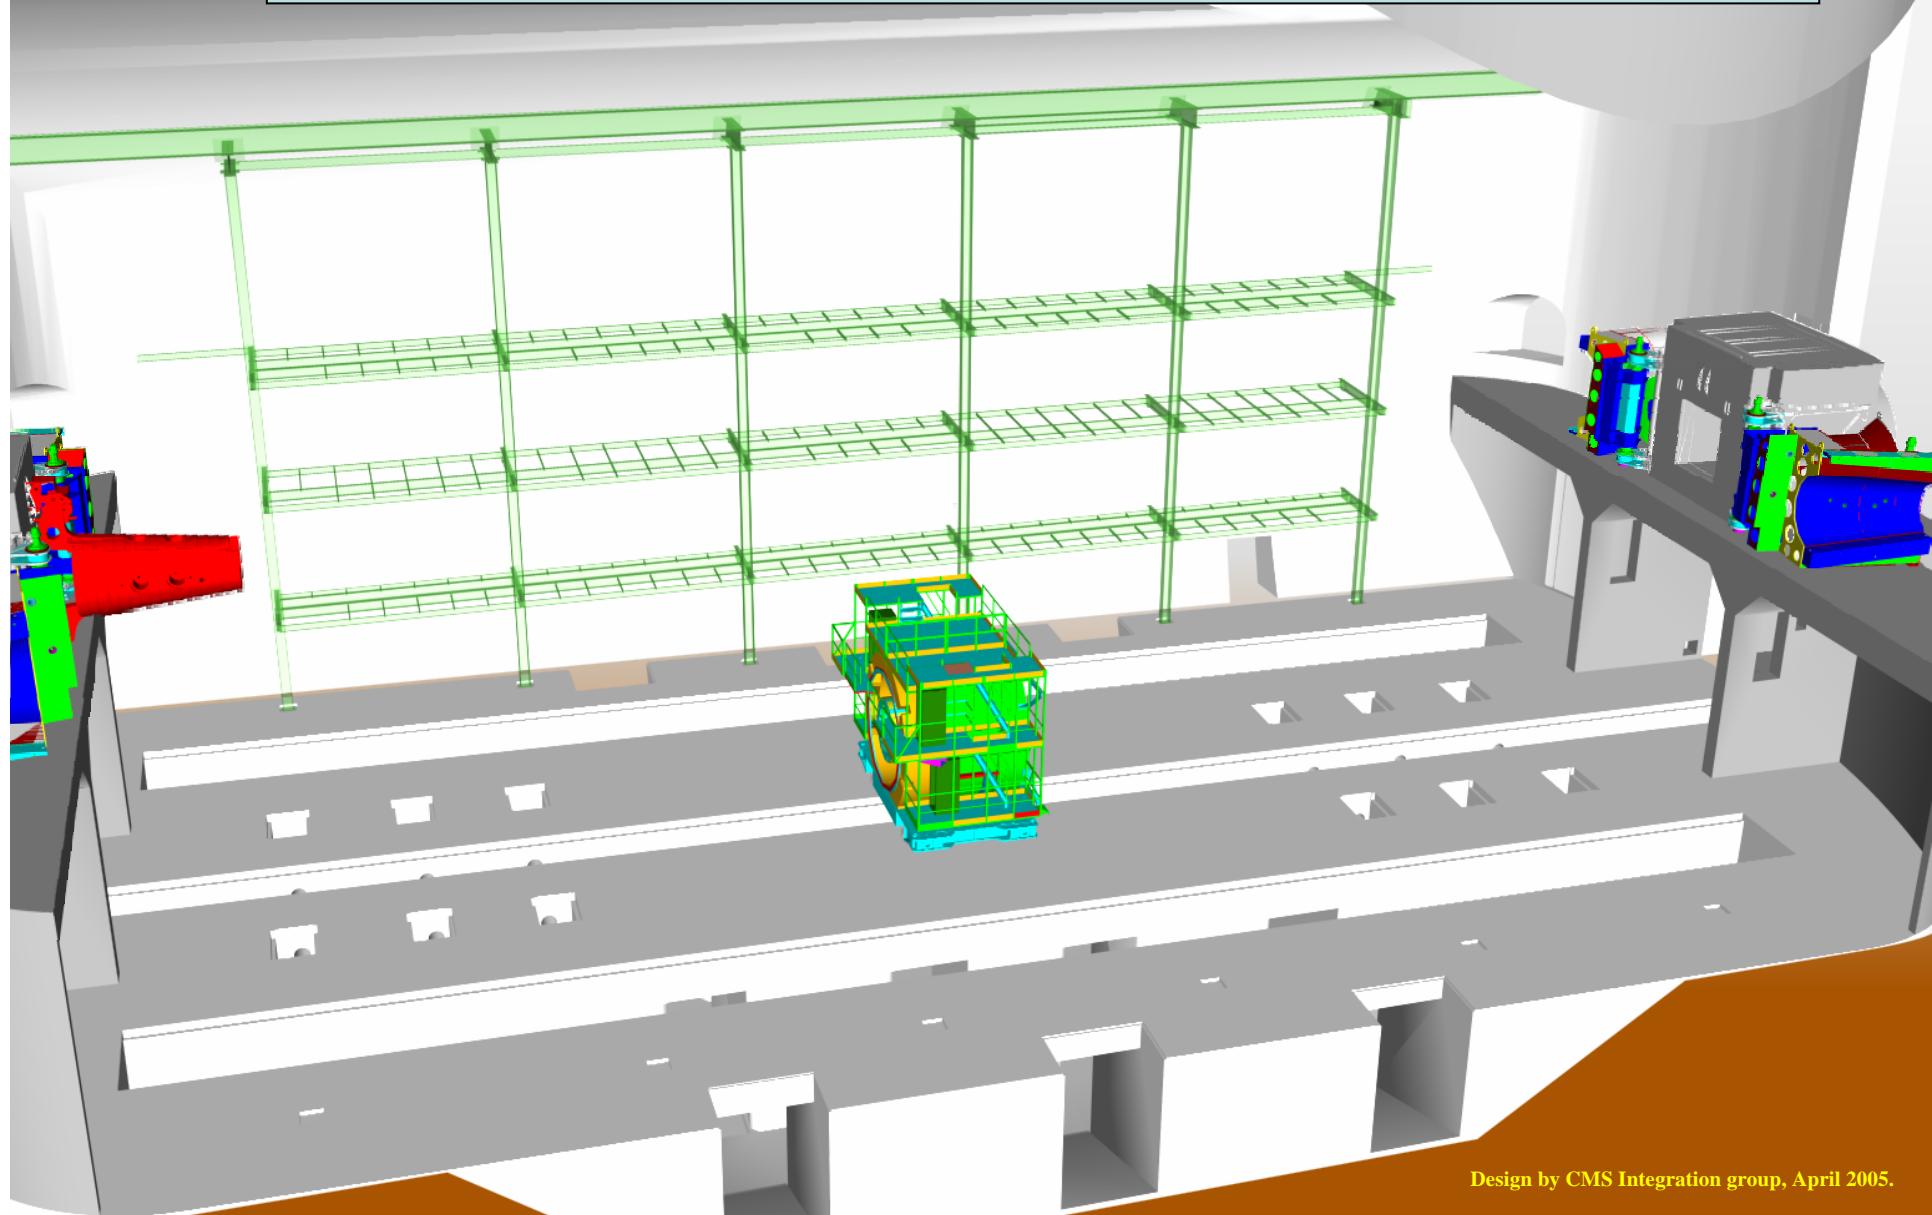

Design by CMS Integration group, April 2005.

Lower HF Z+ move into garage

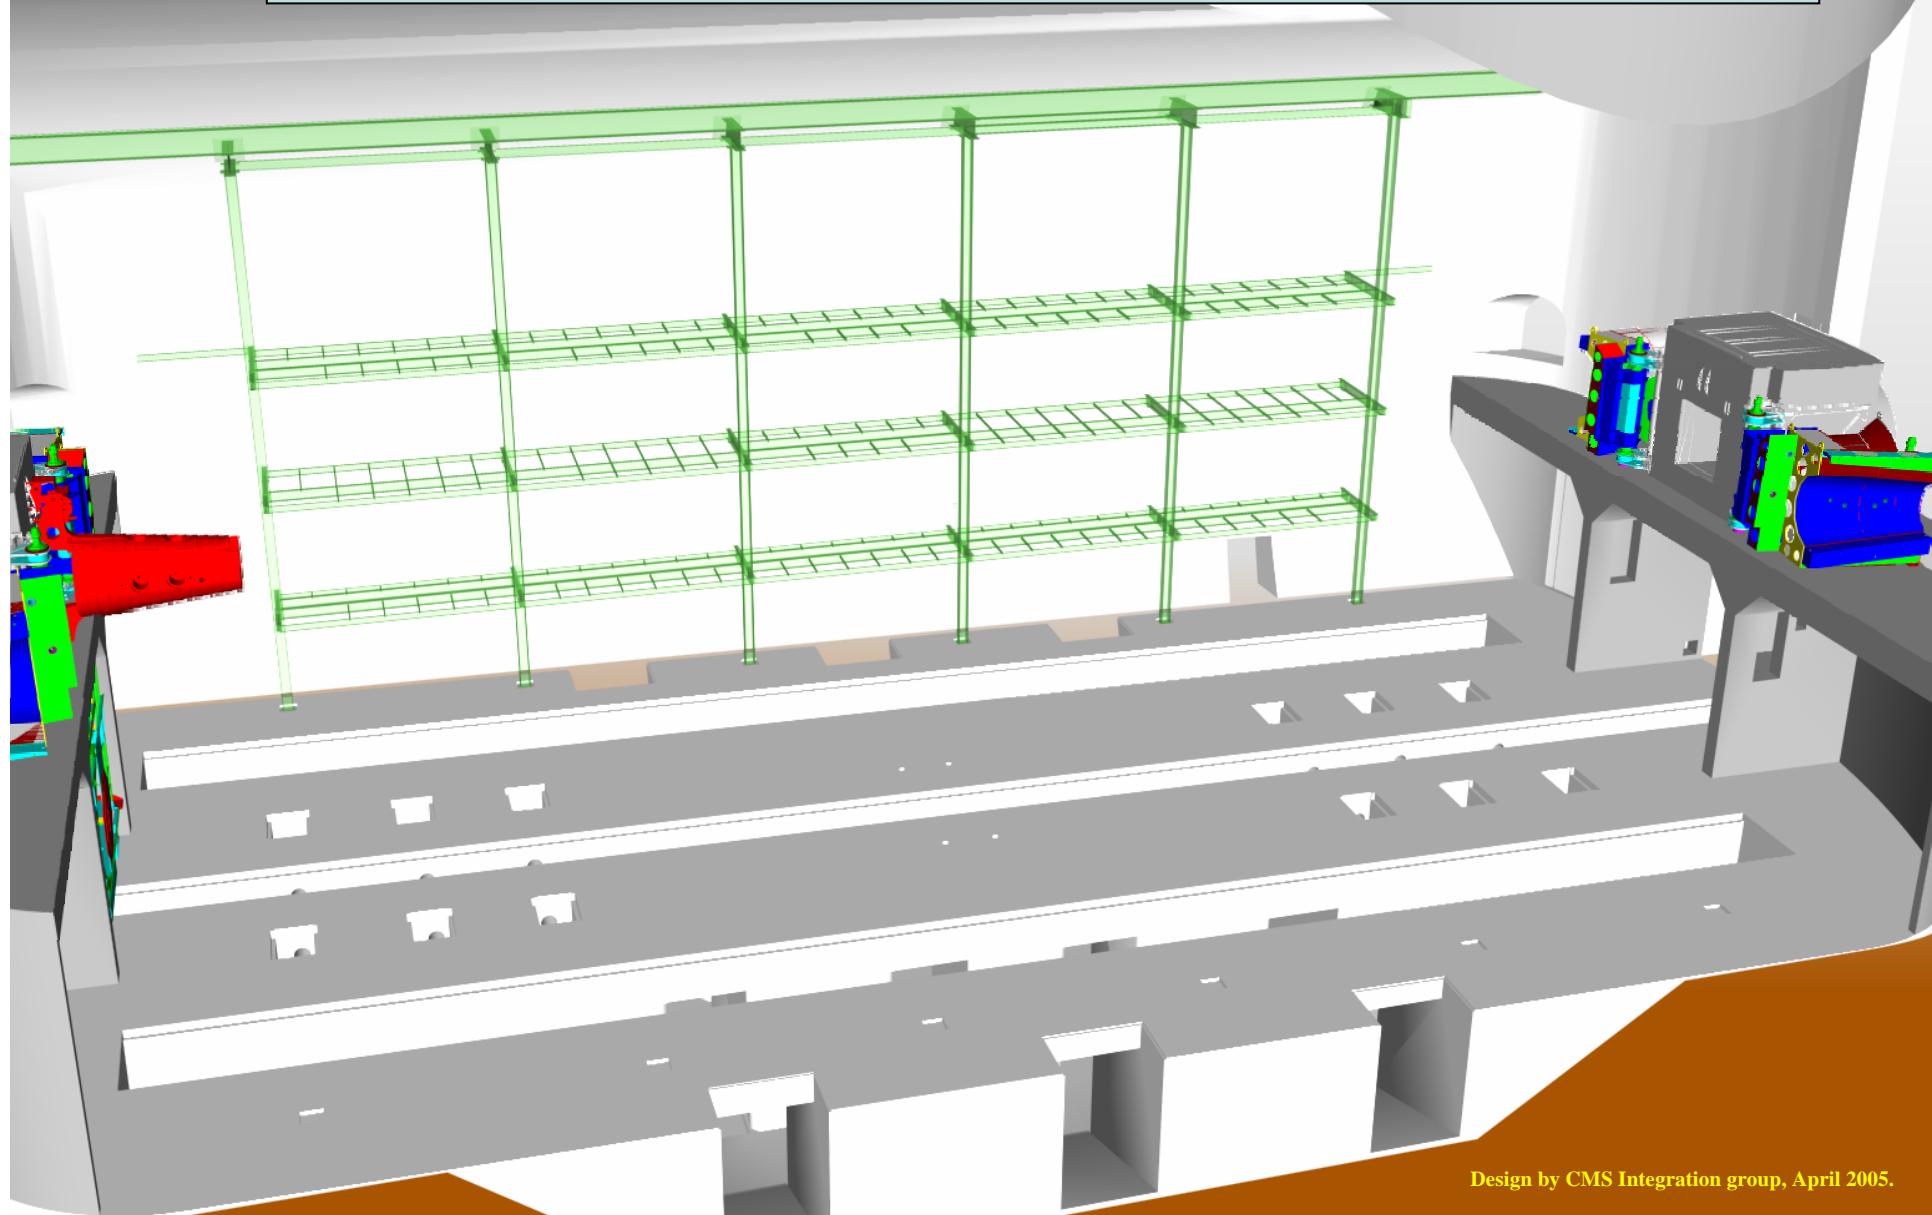

Design by CMS Integration group, April 2005.

Lower HF Z+ move into garage

Design by CMS Integration group, April 2005.

Lower HF Z+ move into garage

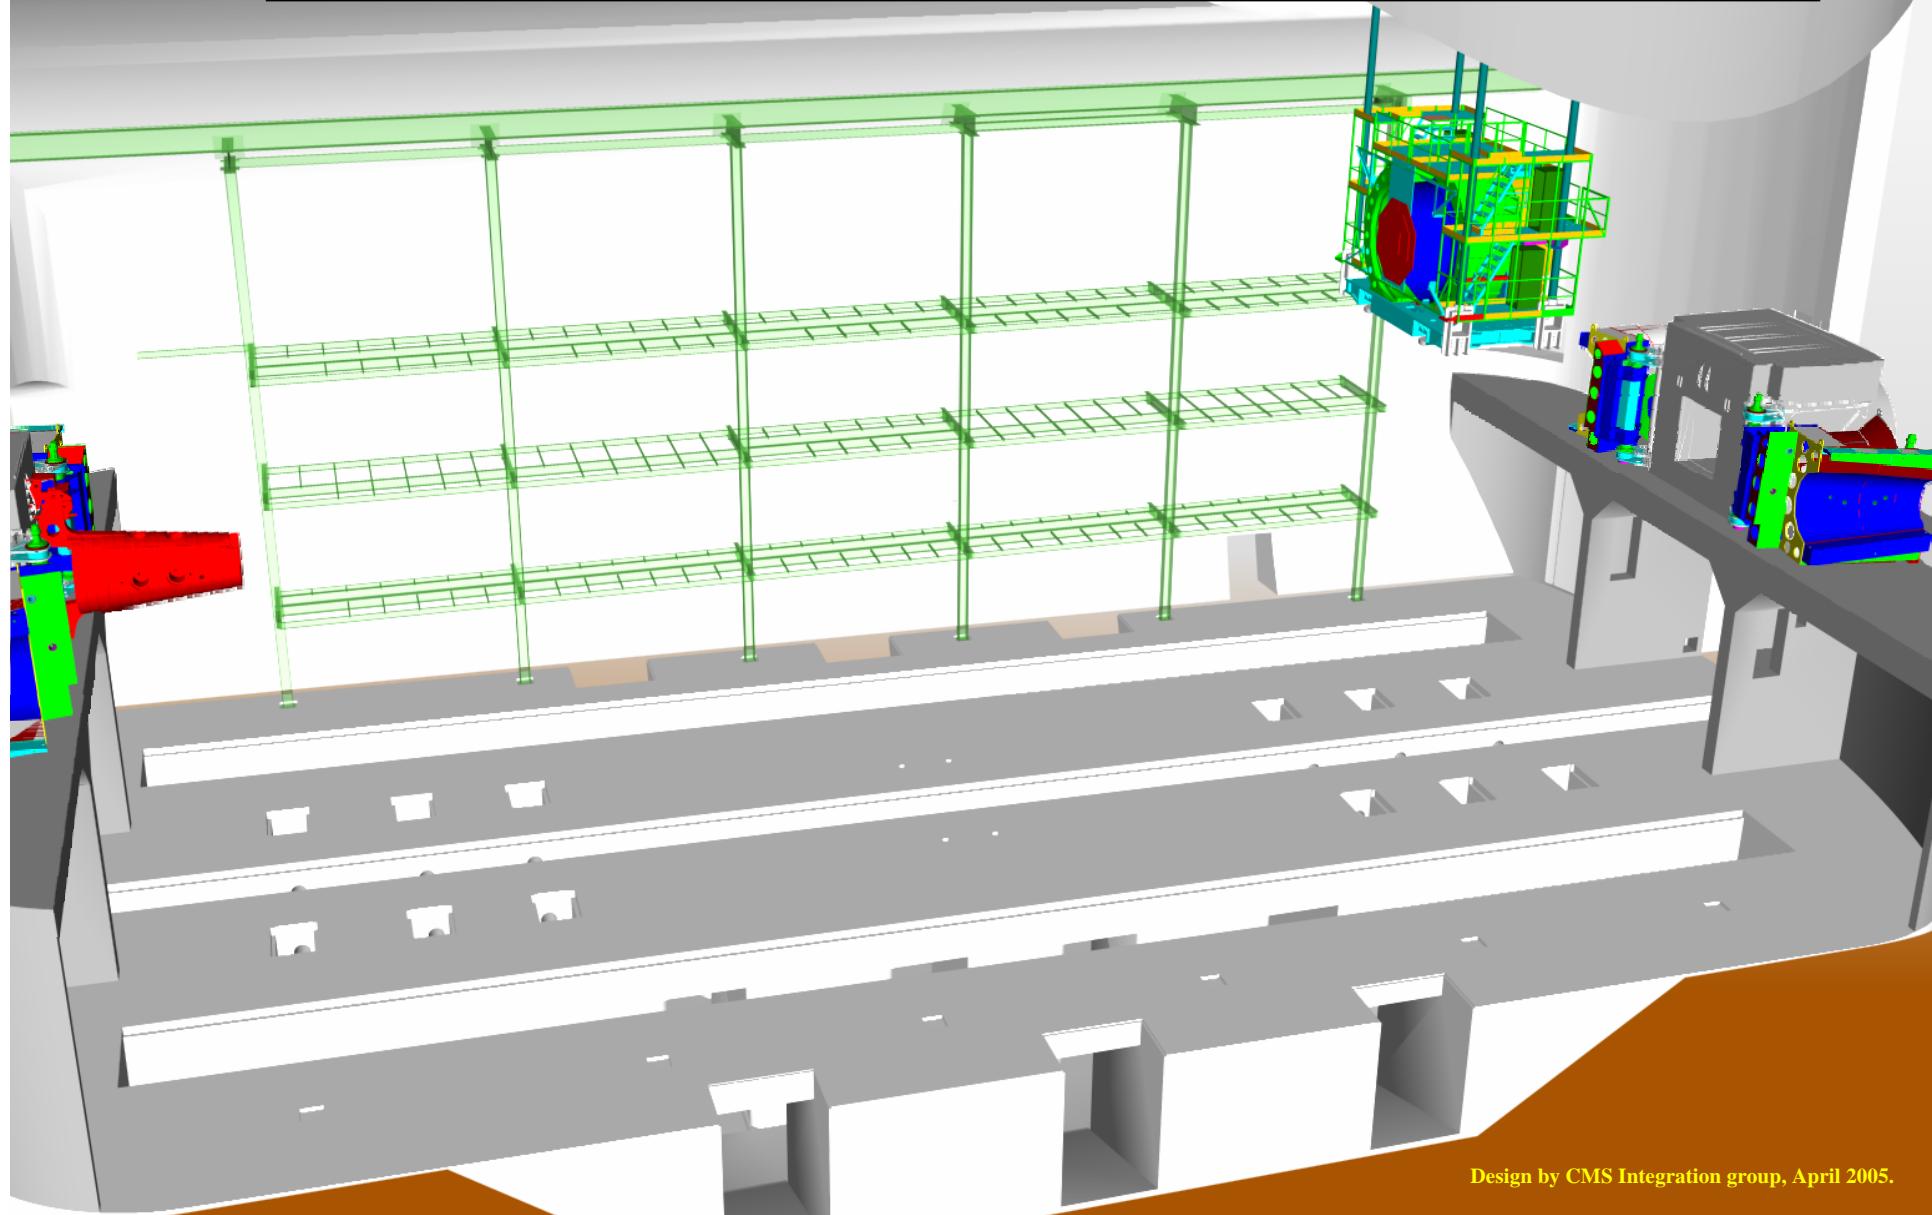

Design by CMS Integration group, April 2005.

**Four 100-ton jacks are recessed in the ground
to lift (and lower) one HF to beam height**

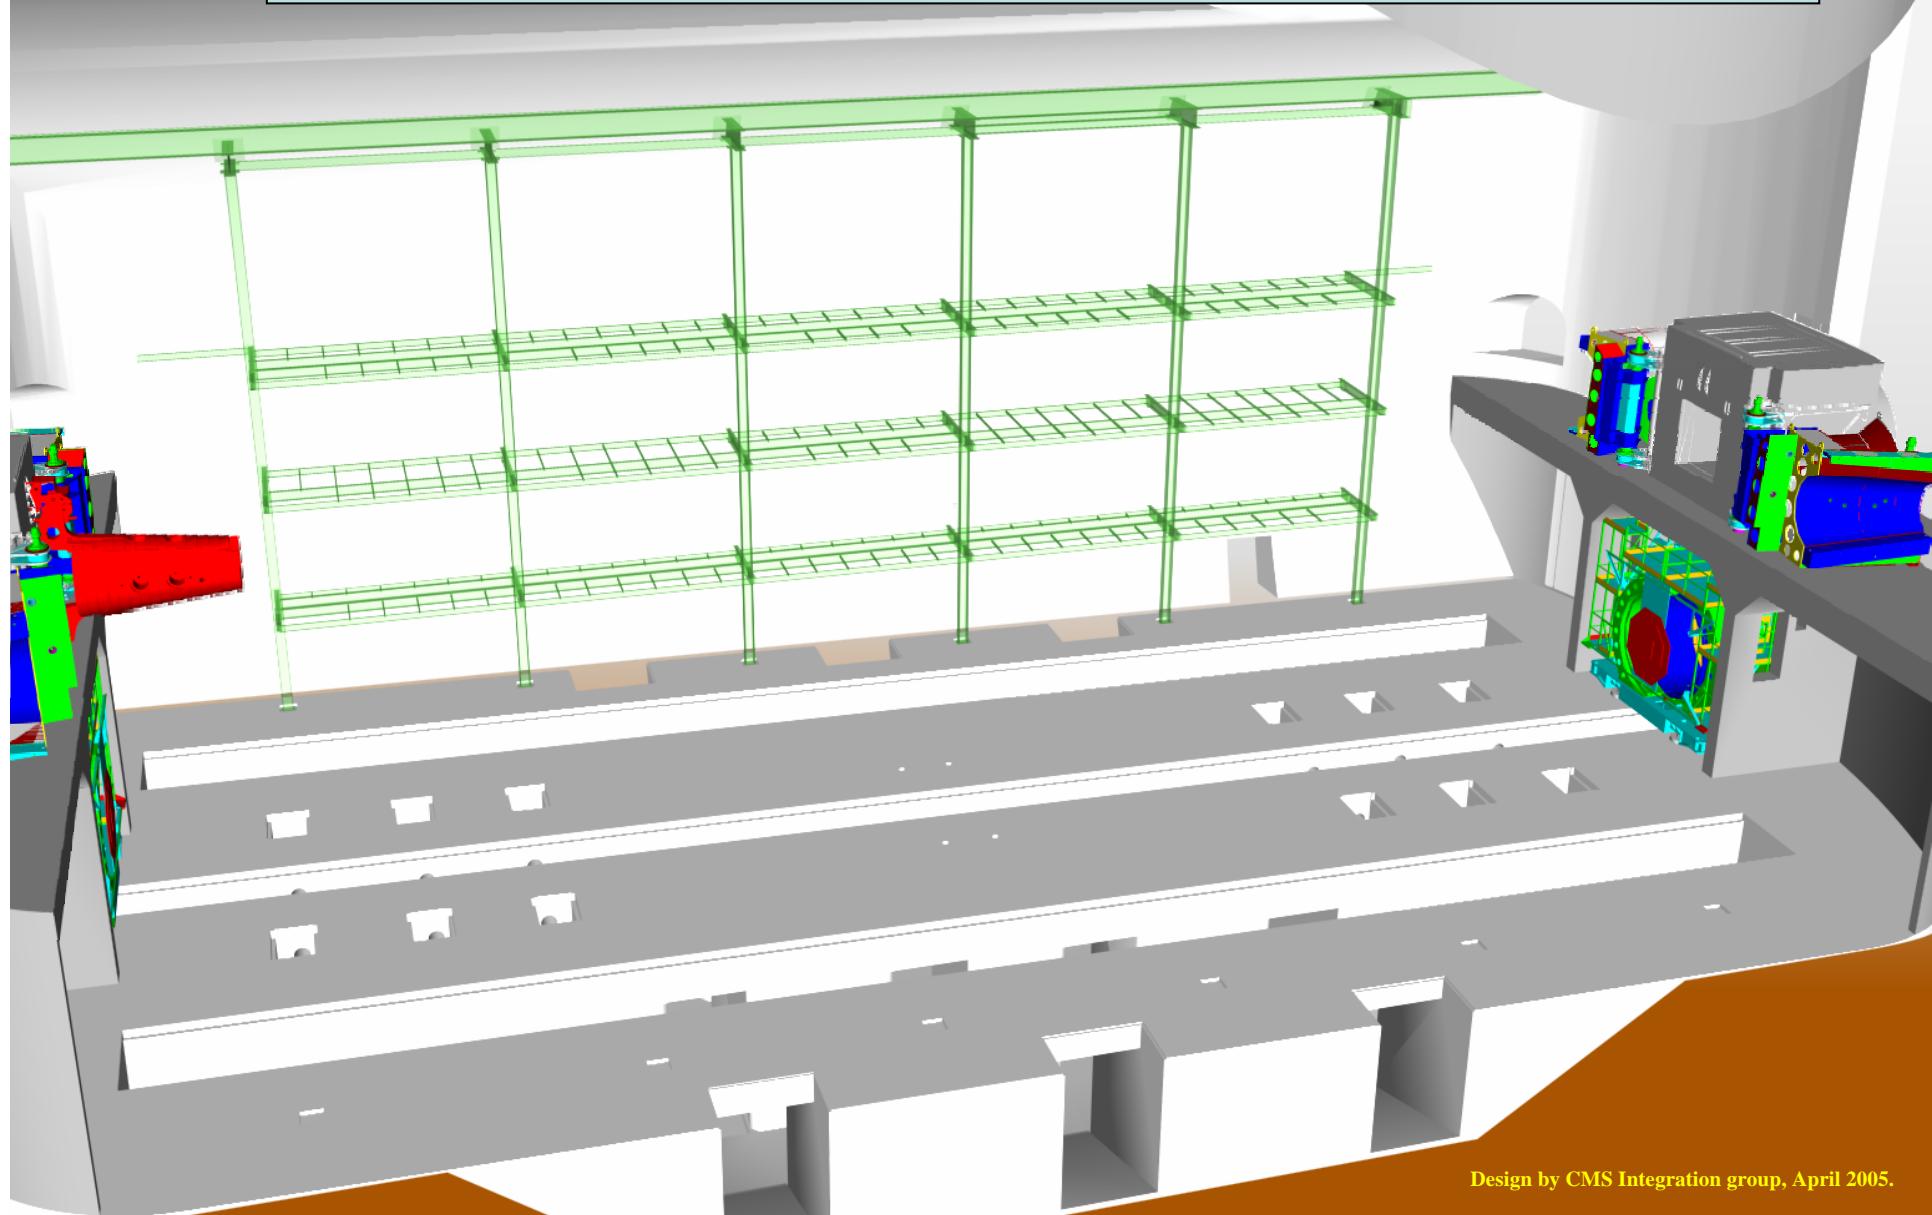

Lower HF Z- move into garage

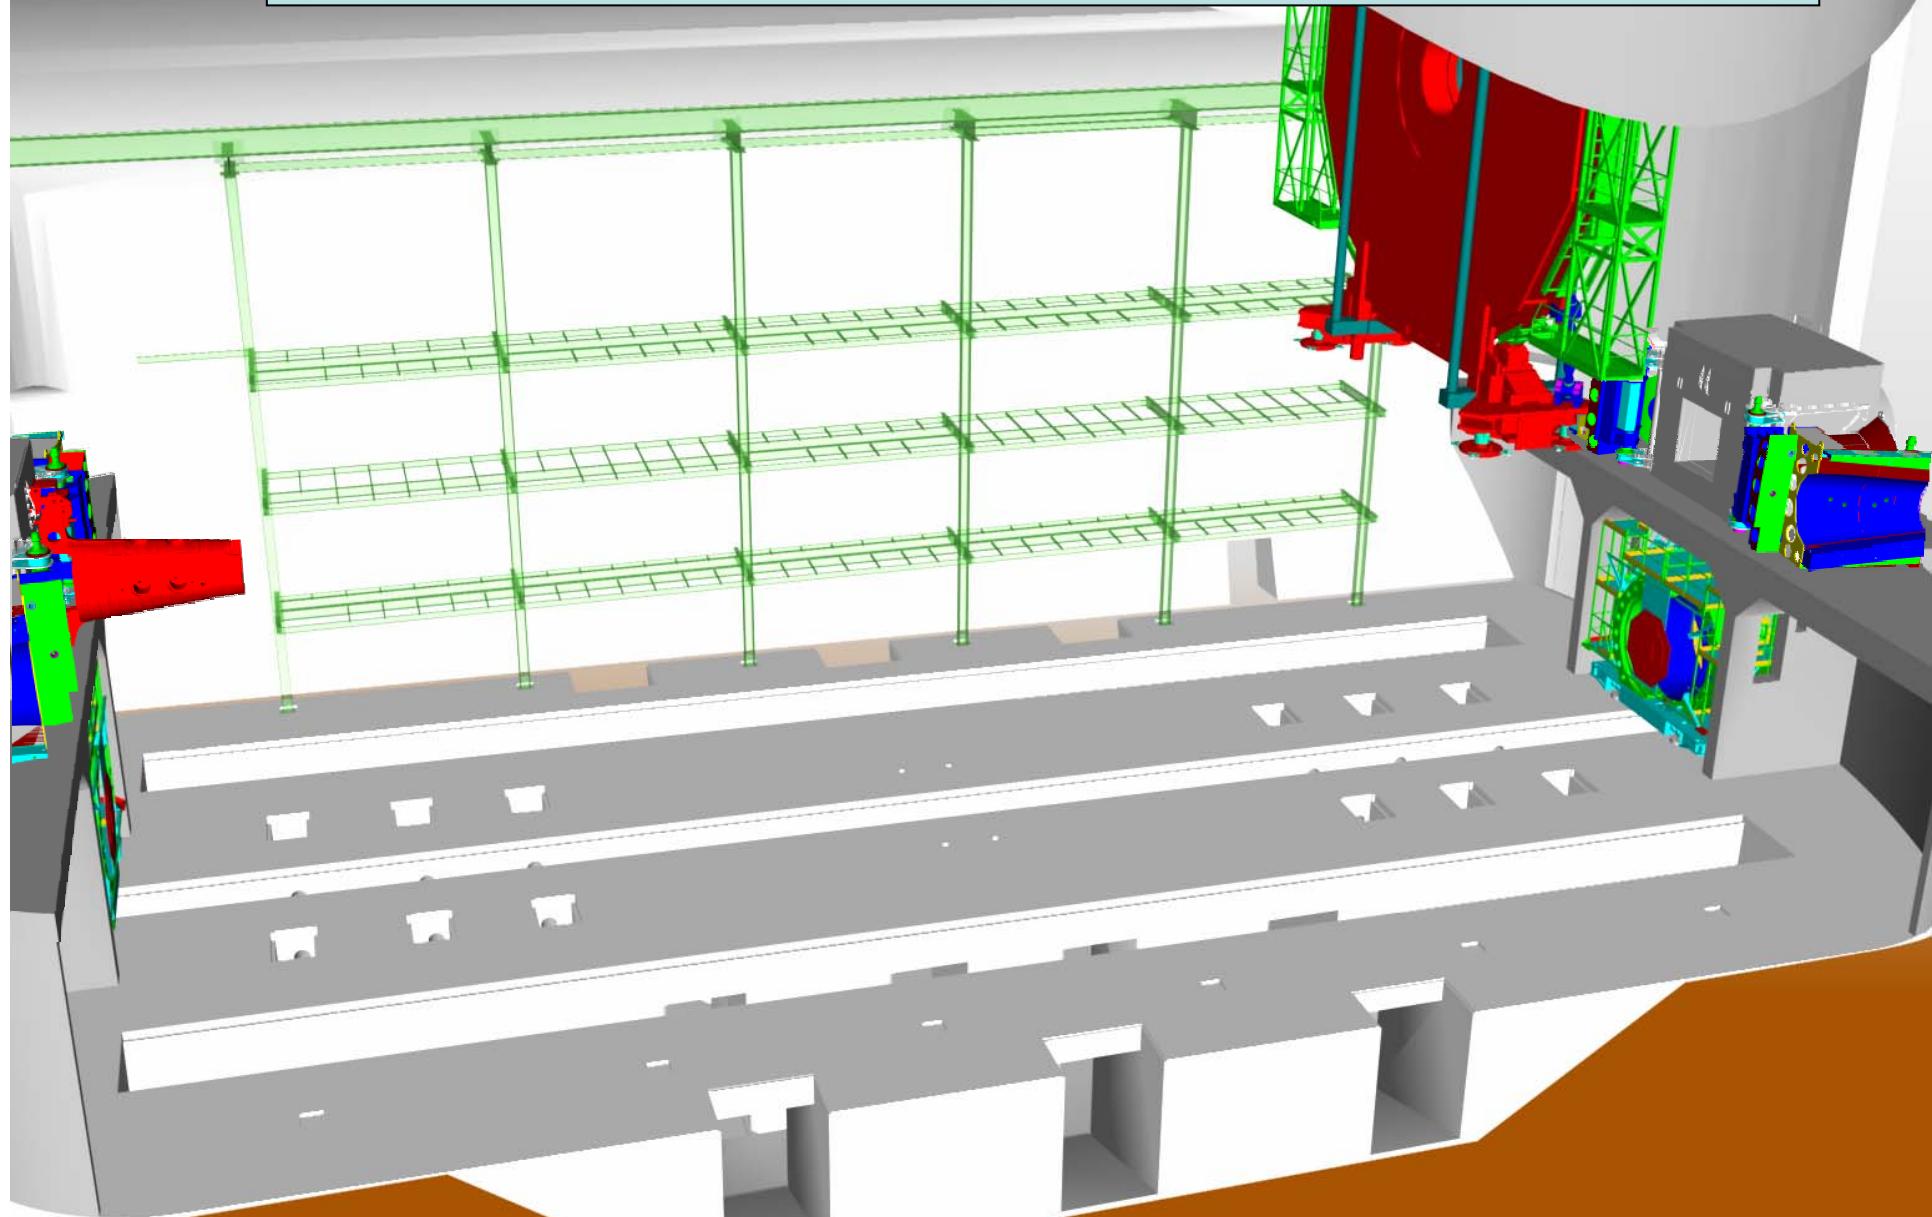

Design by CMS Integration group, April 2005.

Lower HF Z- move into garage

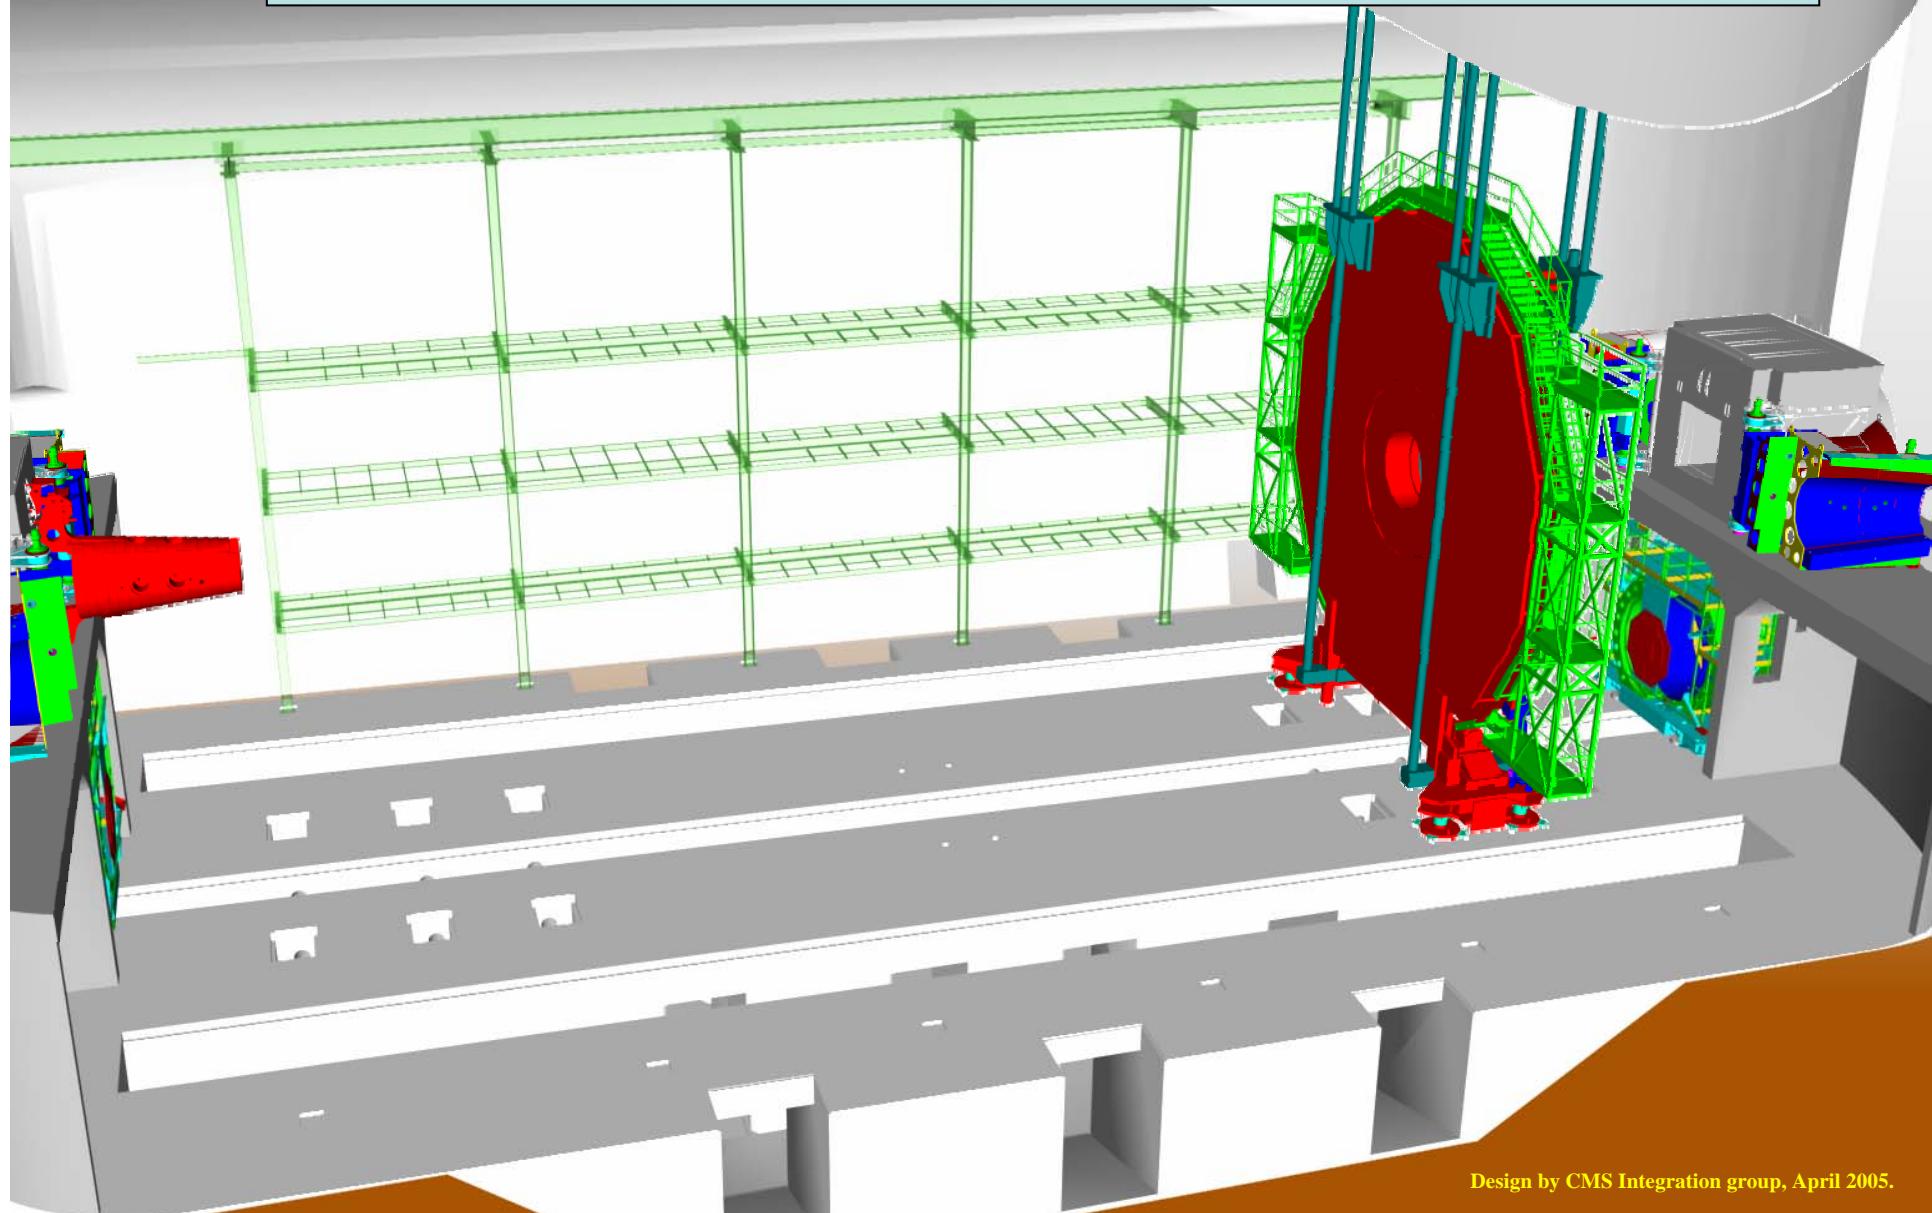

Design by CMS Integration group, April 2005.

Lower YE+3 move to far Z+

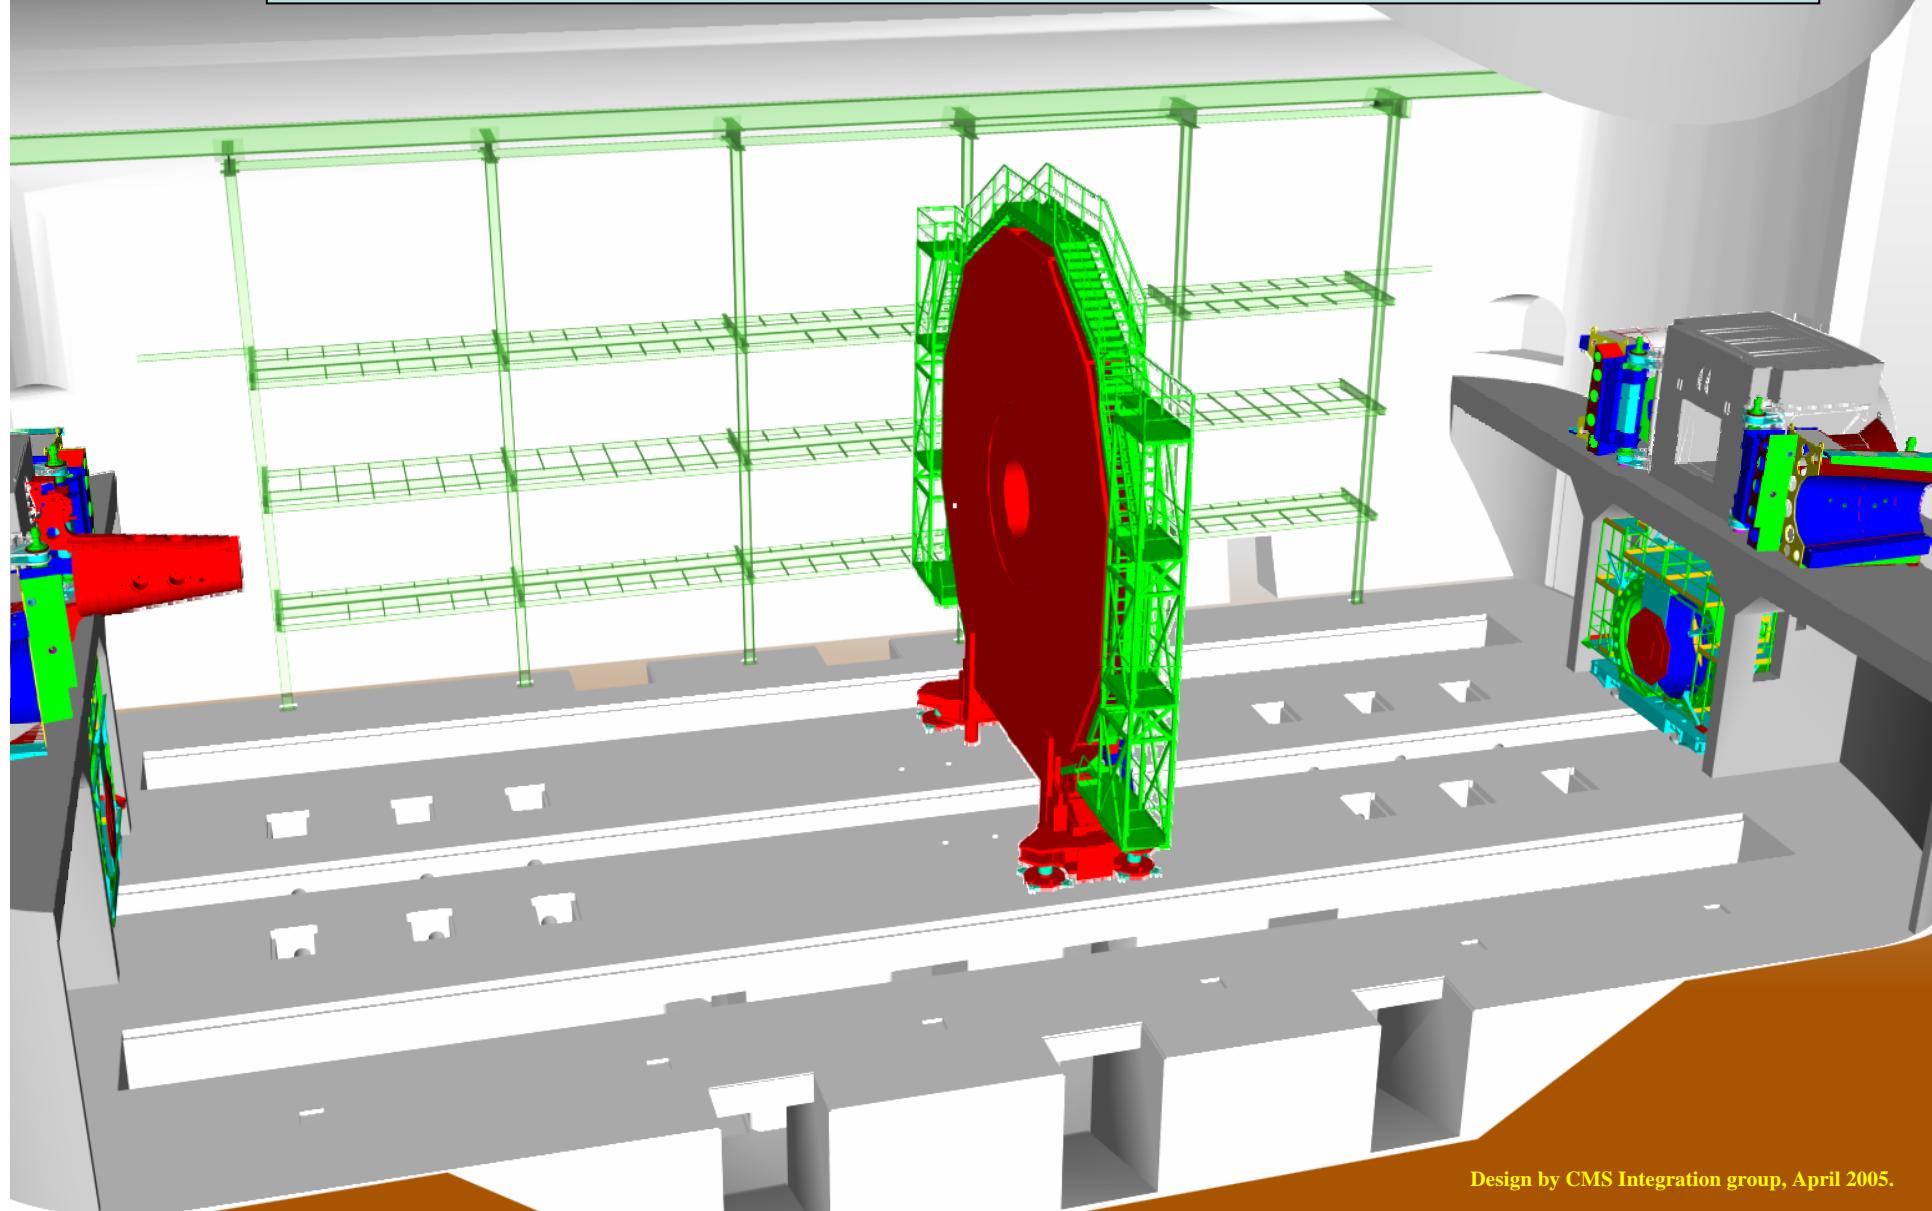

Lower YE+3 move to far Z+

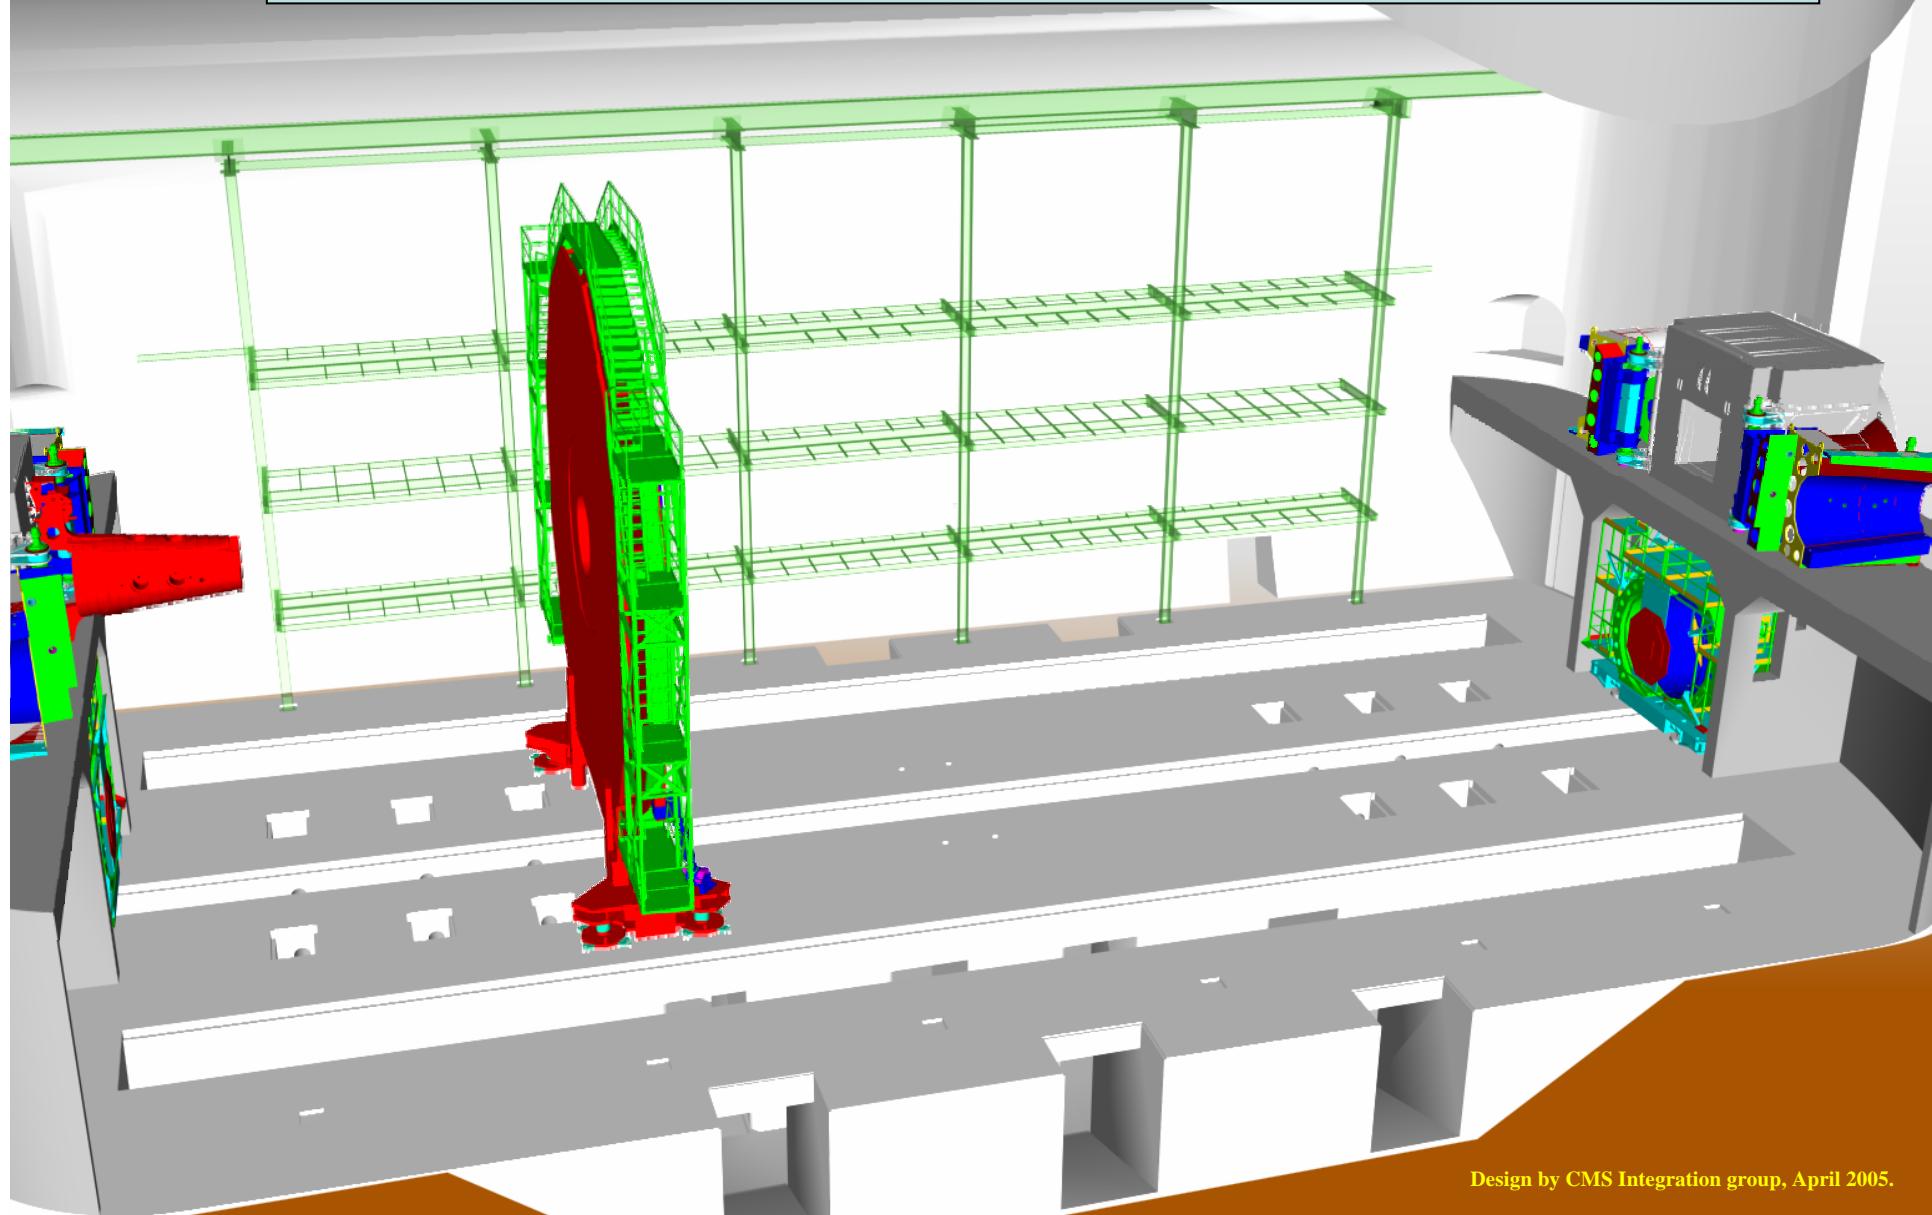

Design by CMS Integration group, April 2005.

Lower YE+3 move to far Z+

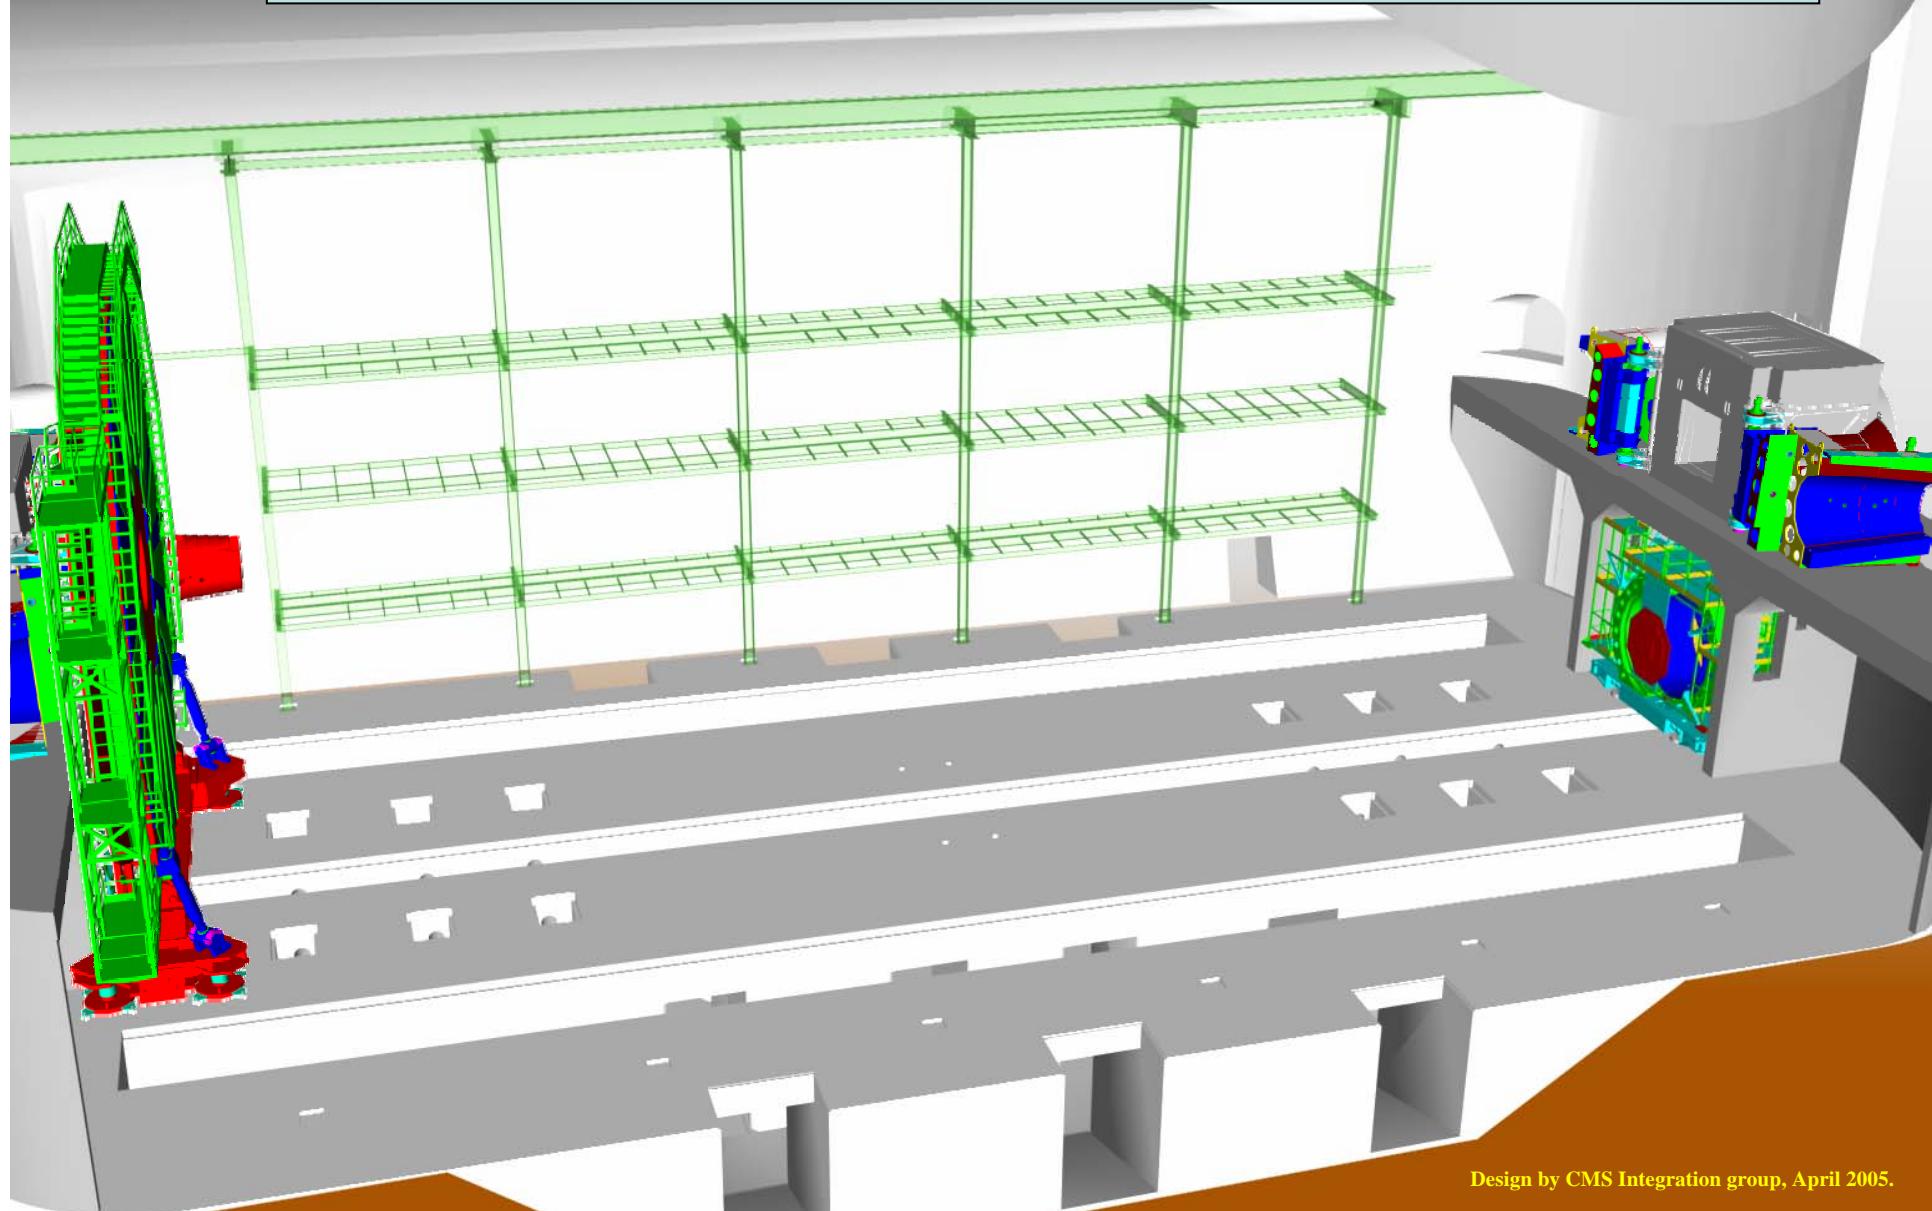

Design by CMS Integration group, April 2005.

Lower YE+3 move to far Z+

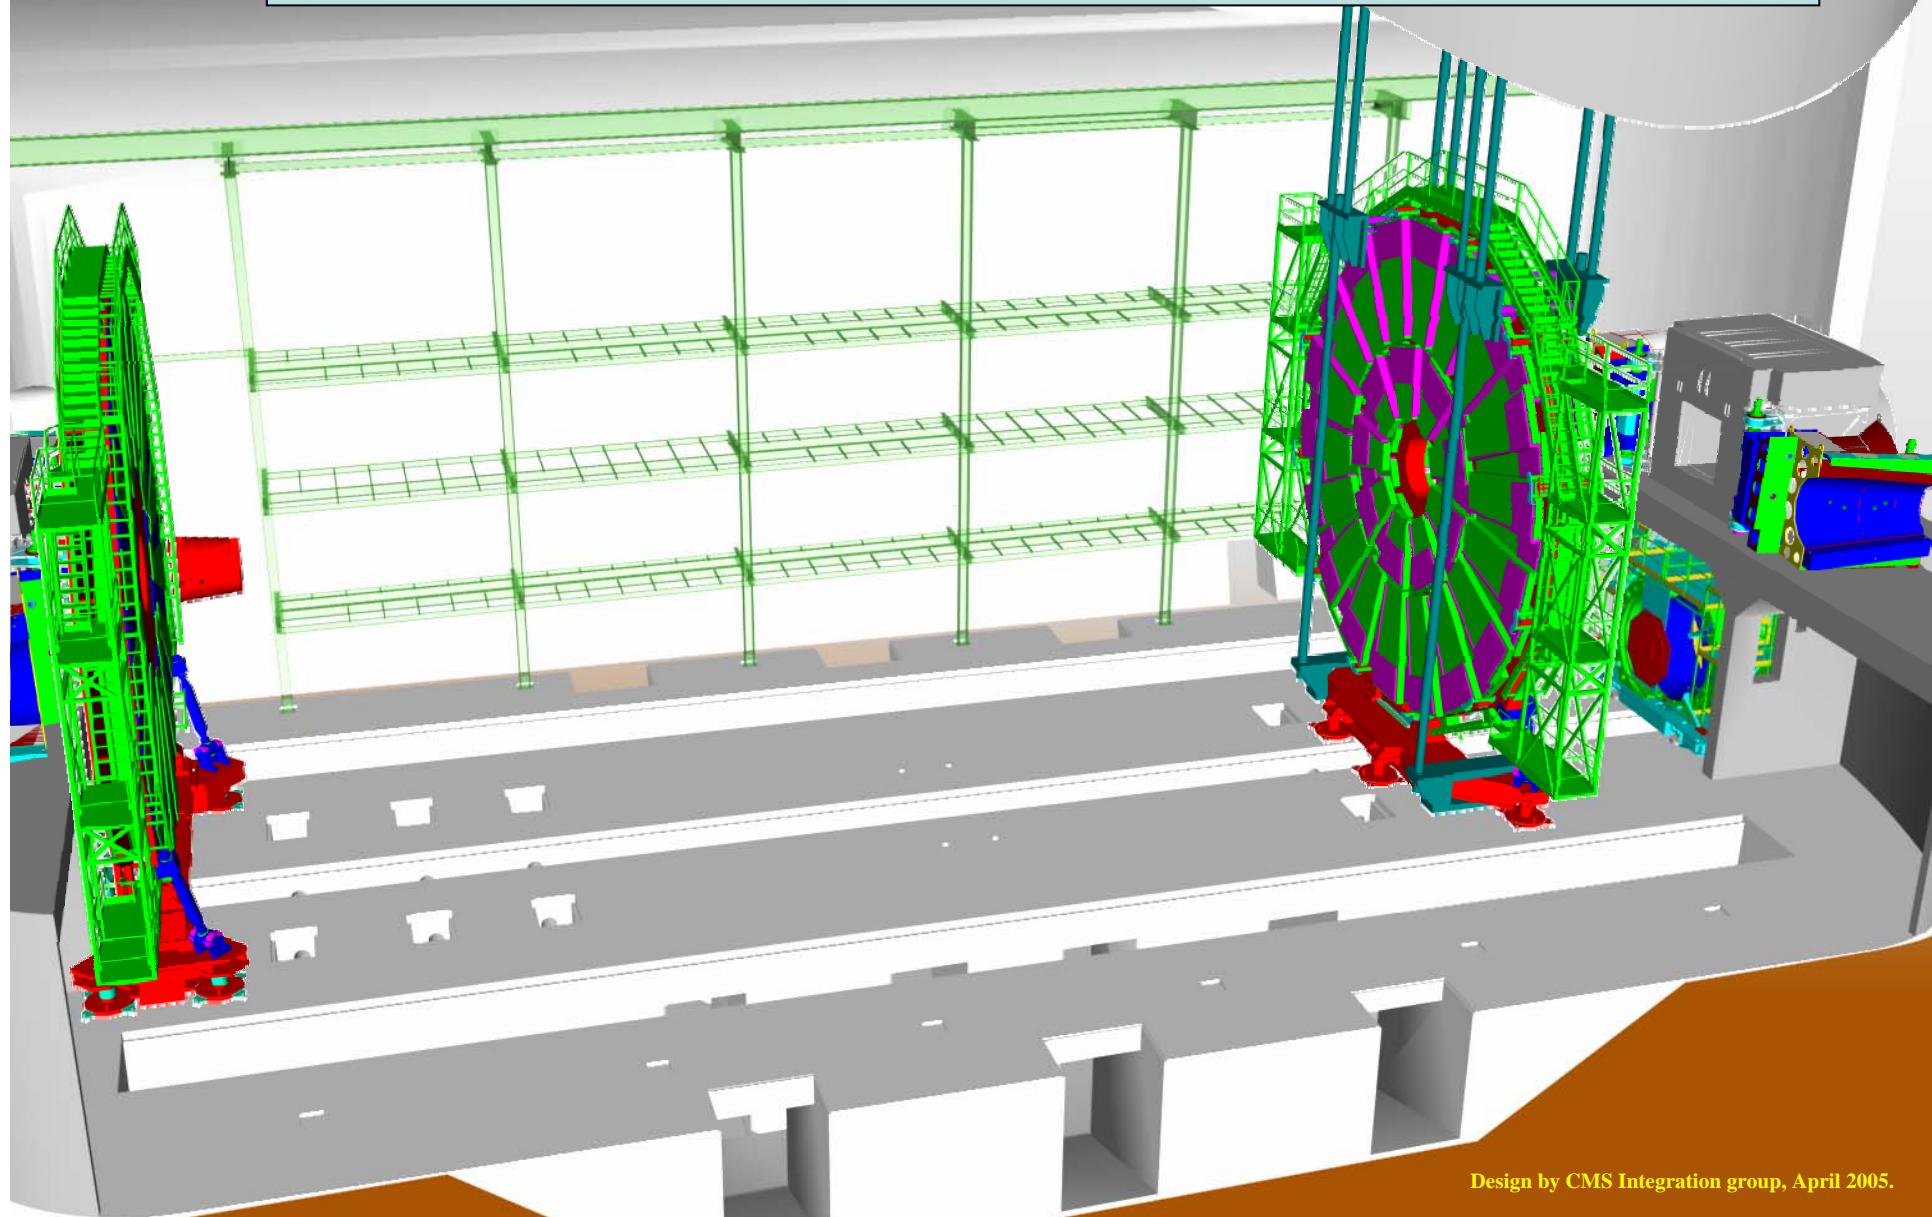

Design by CMS Integration group, April 2005.

Lower YE+3 move to far Z+

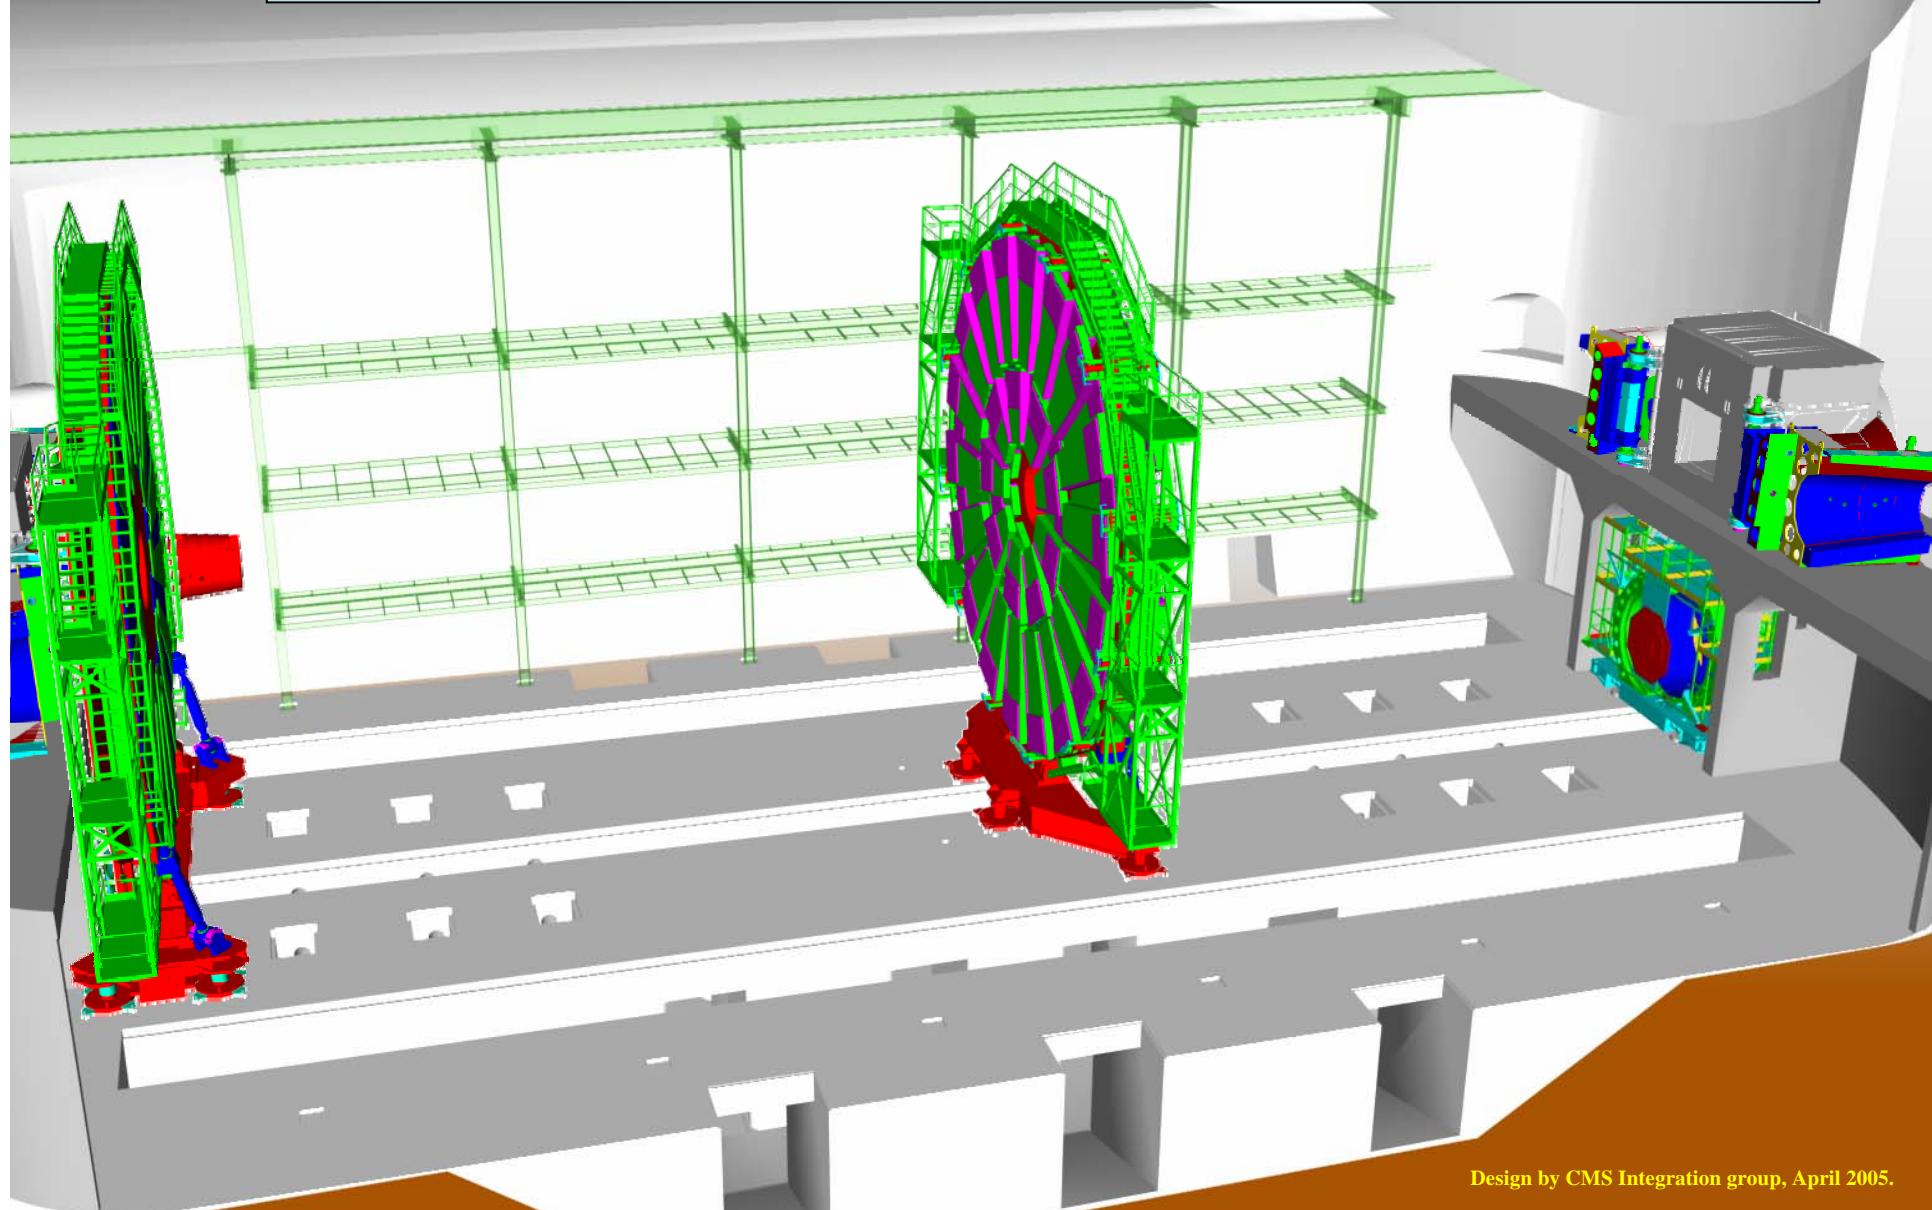

Design by CMS Integration group, April 2005.

Lower YE+2 move to far Z+

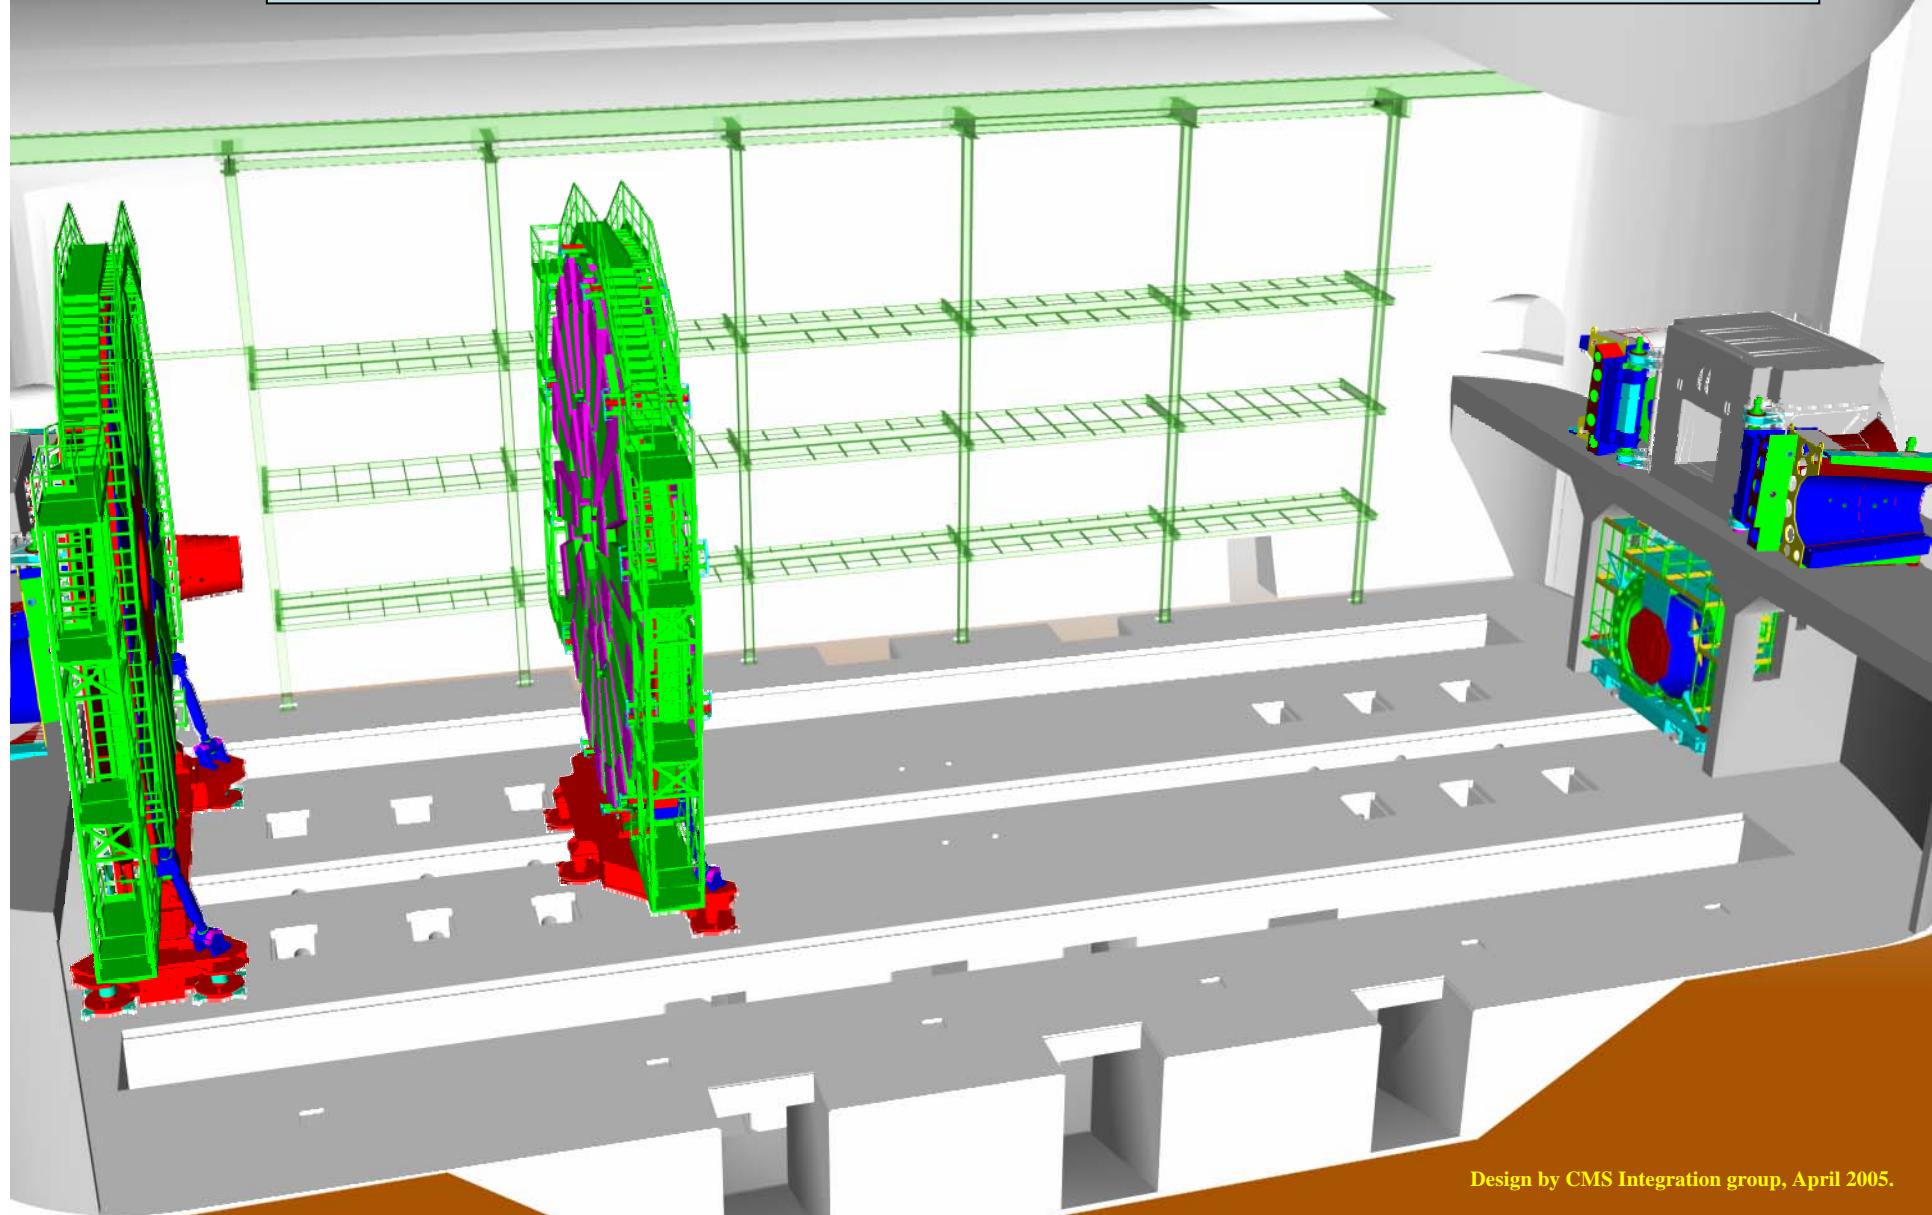

Design by CMS Integration group, April 2005.

Lower YE+2 move to far Z+

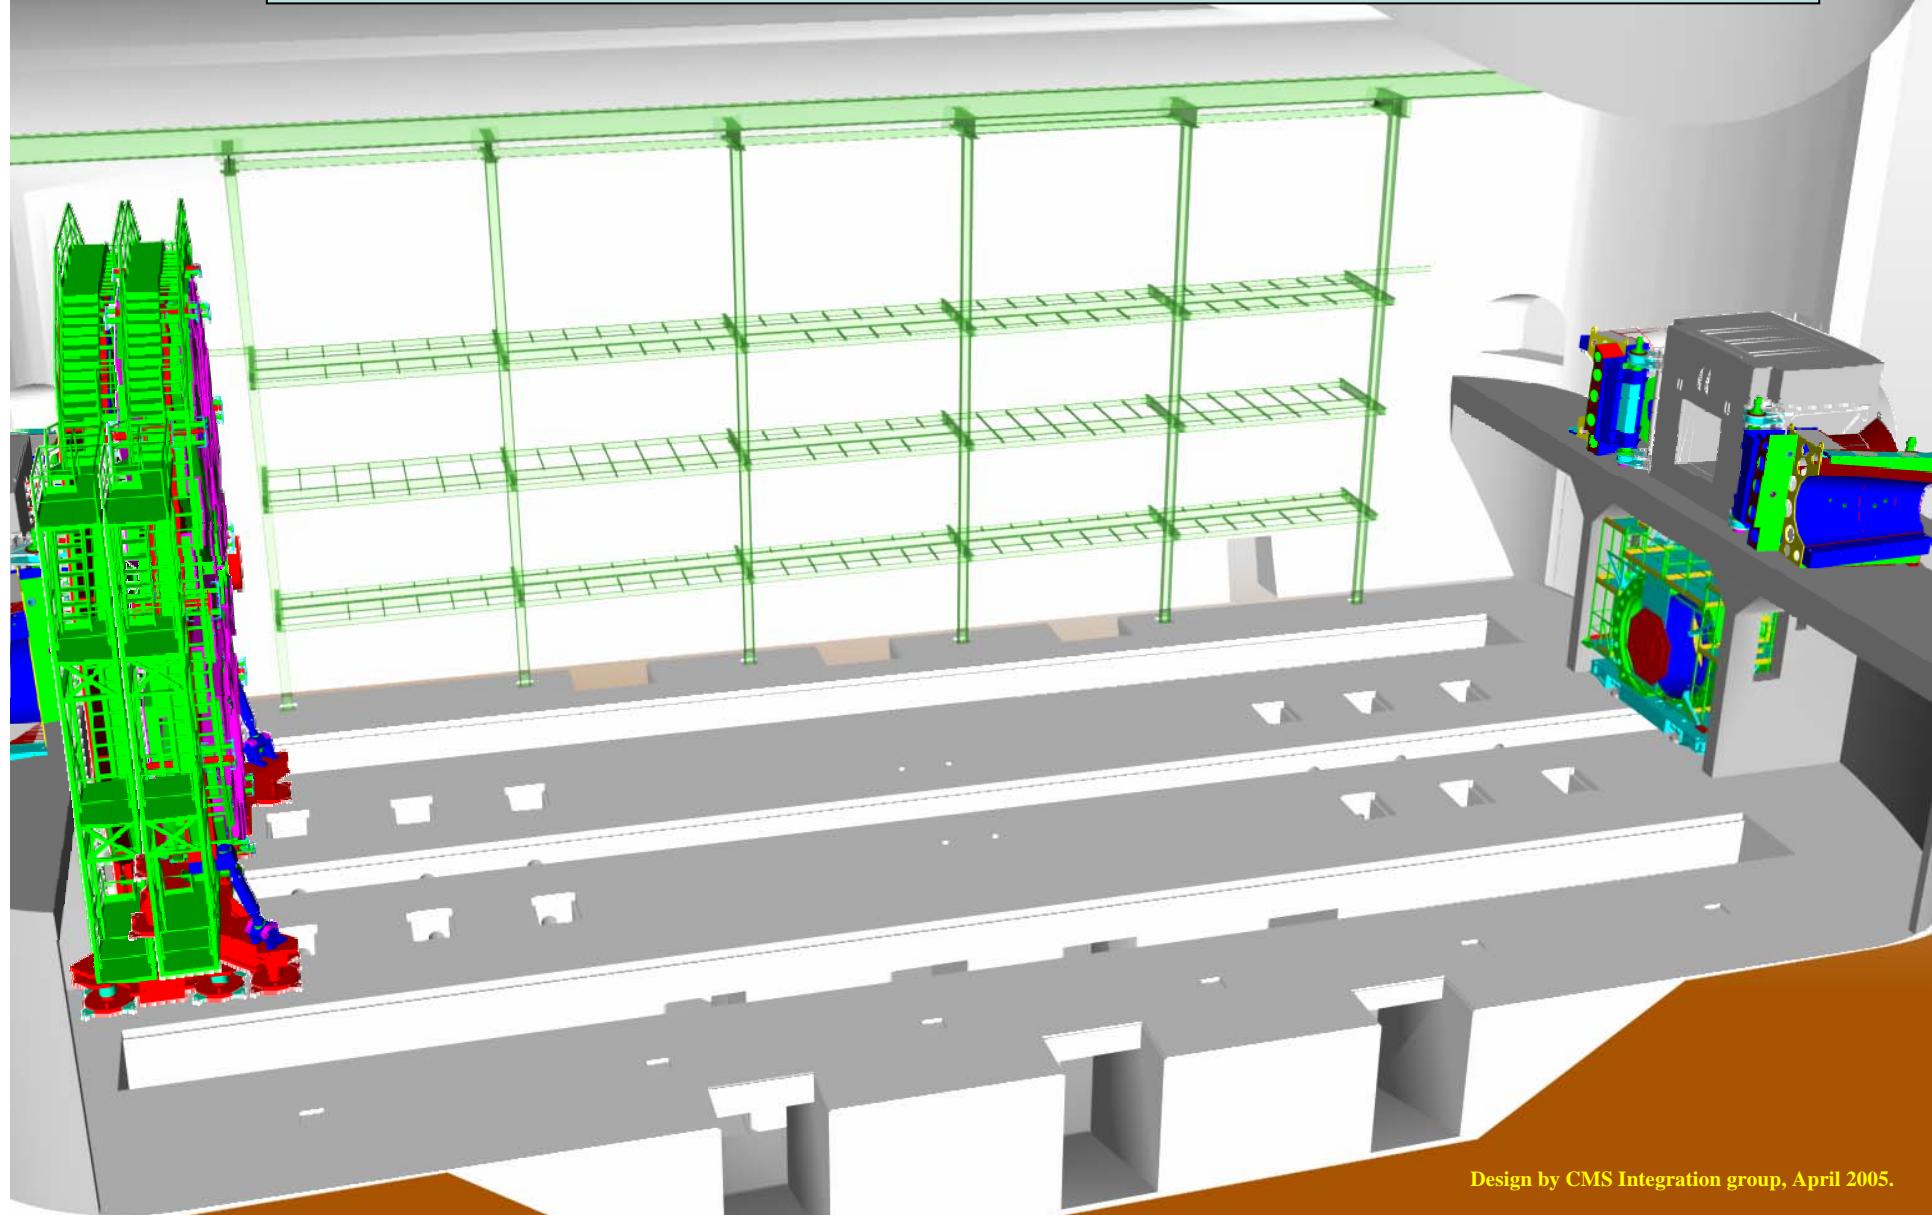

Design by CMS Integration group, April 2005.

Lower YE+2 move to far Z+

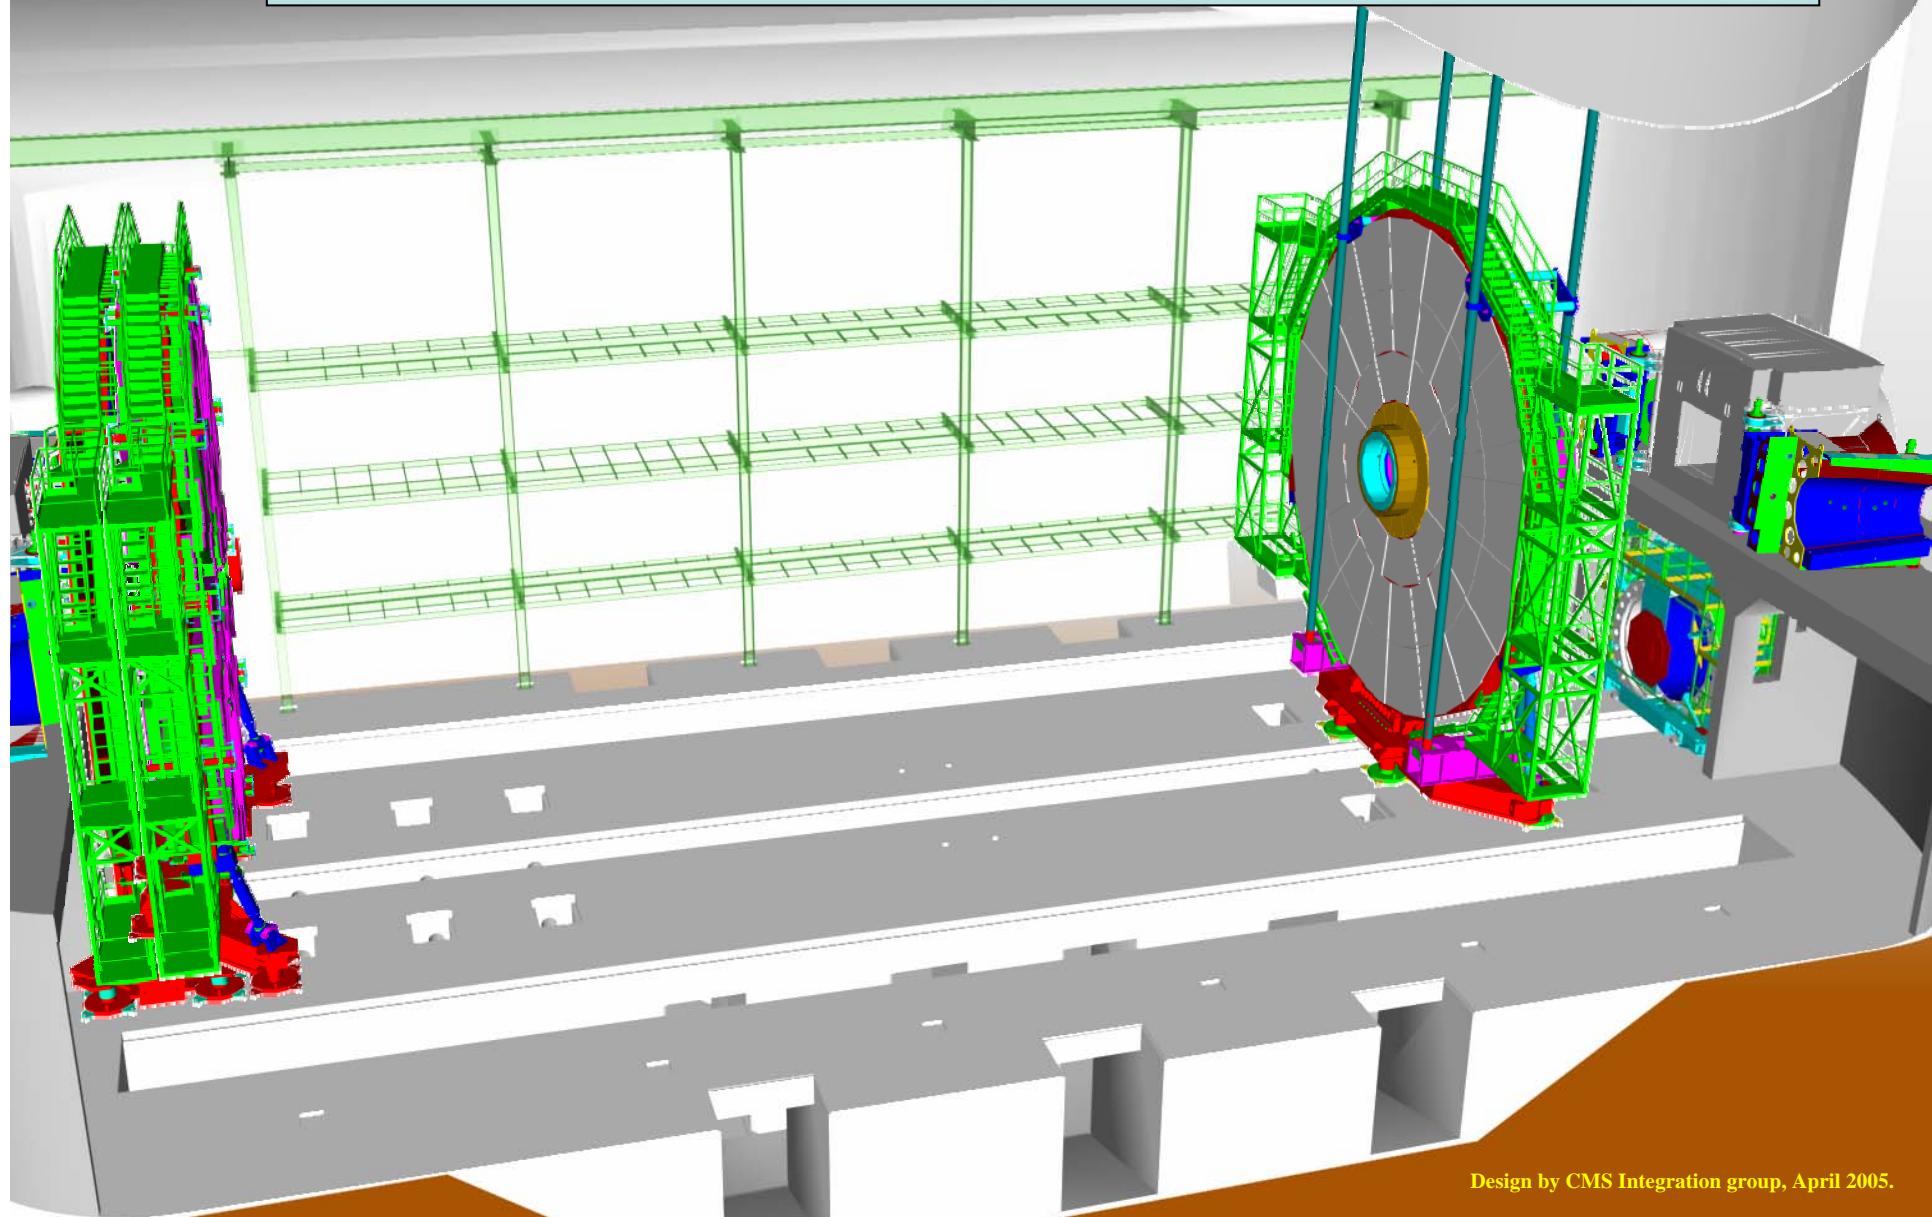

Design by CMS Integration group, April 2005.

Lower YE+2 move to far Z+

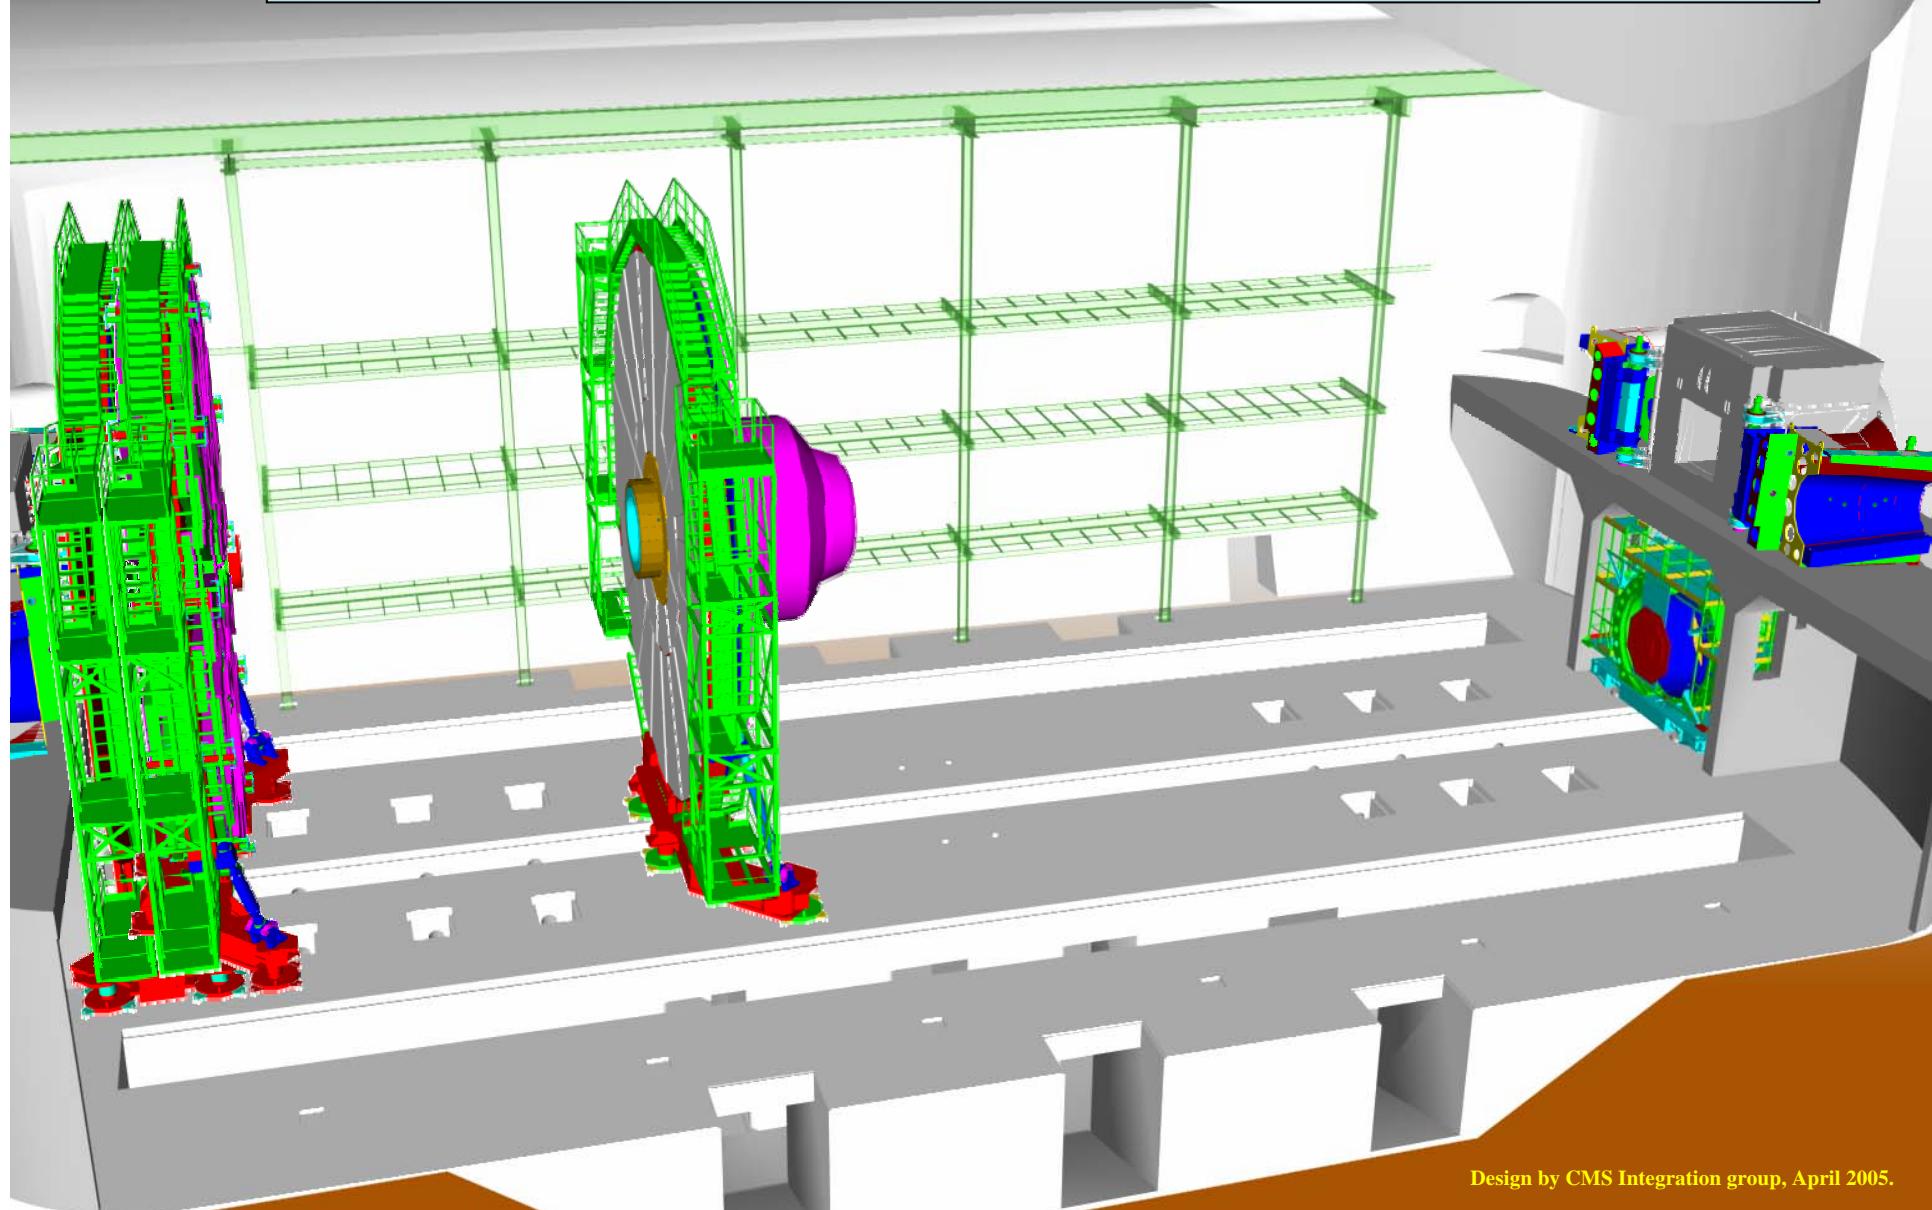

Design by CMS Integration group, April 2005.

Lower YE+1 move to far Z+

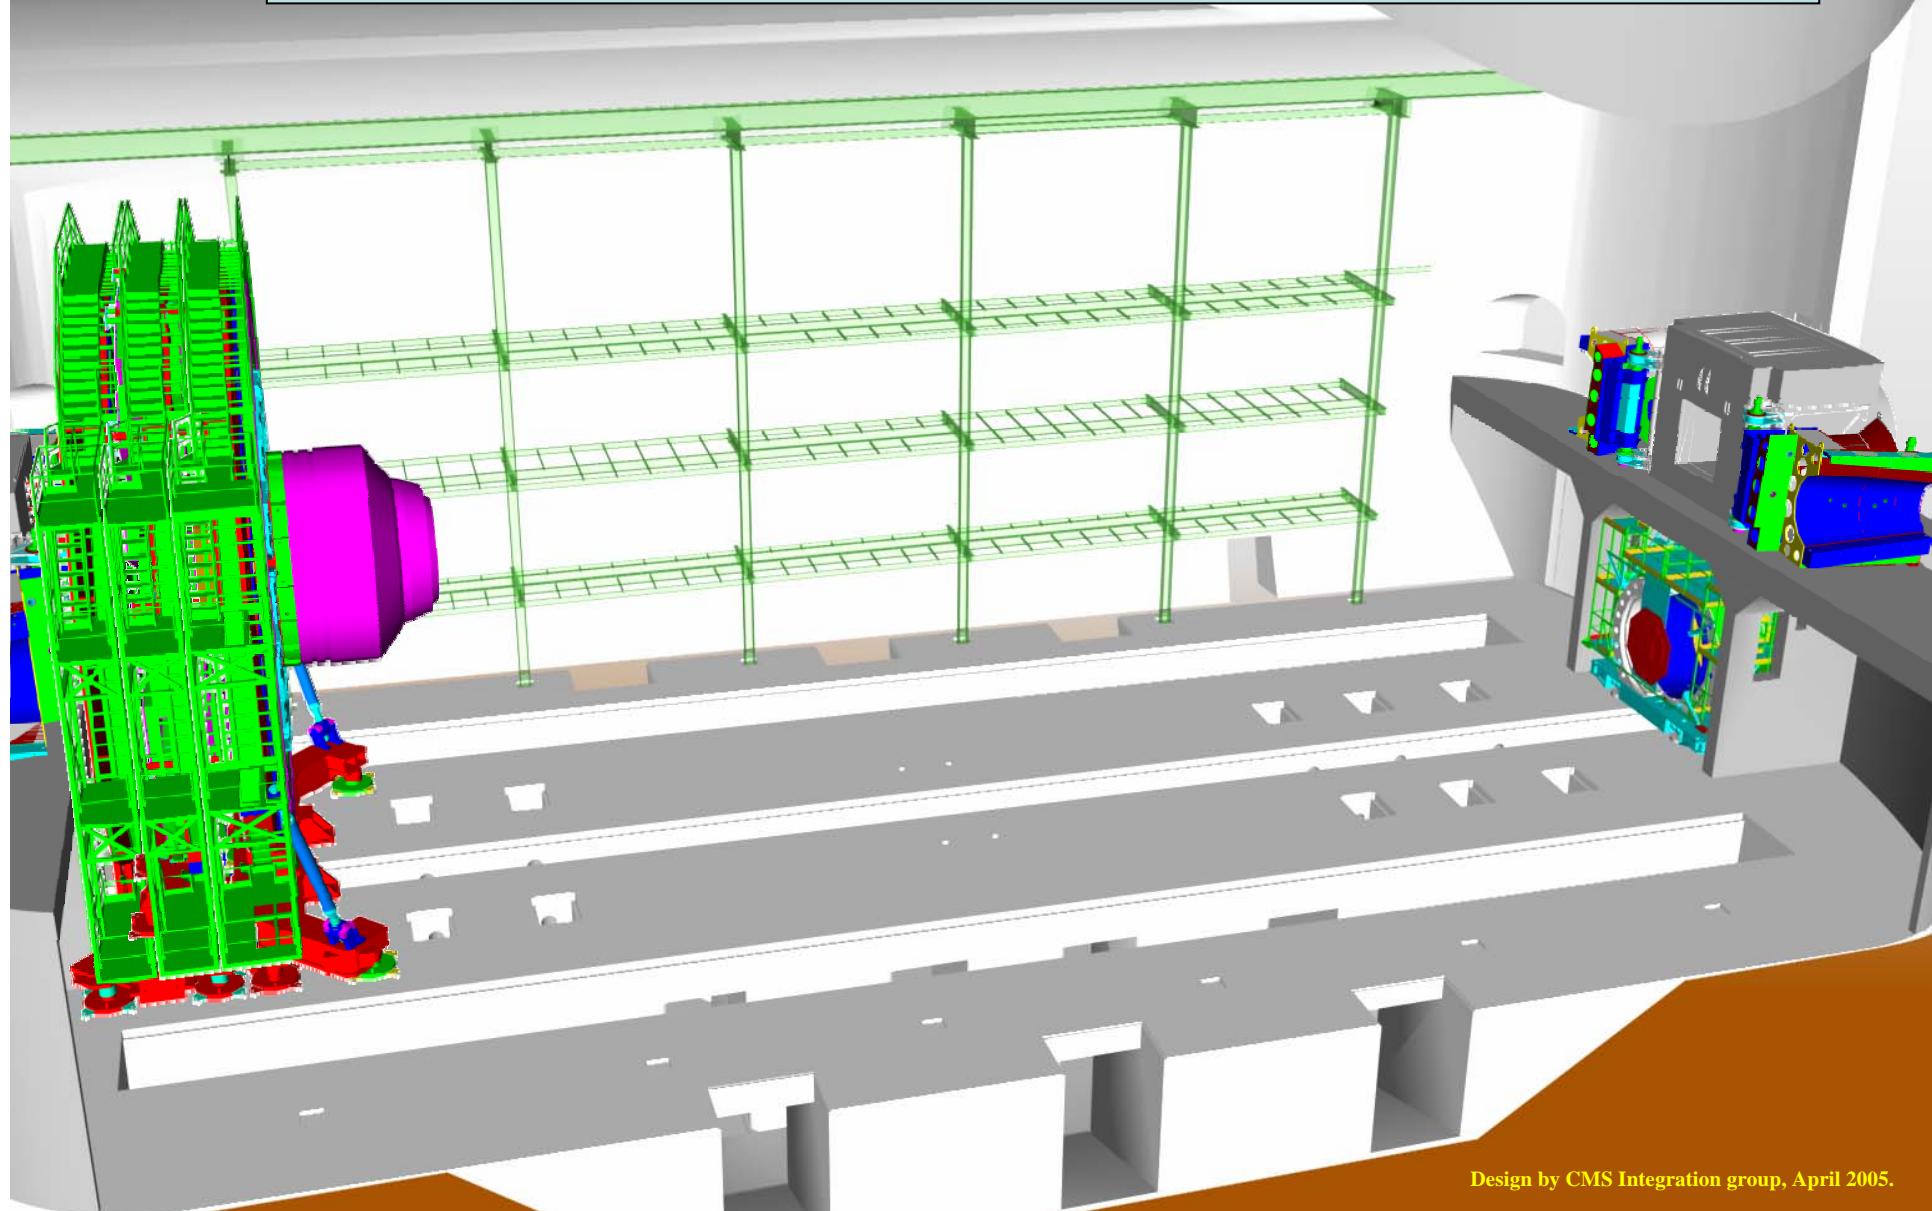

Design by CMS Integration group, April 2005.

Lower YE+1 move to far Z+

Design by CMS Integration group, April 2005.

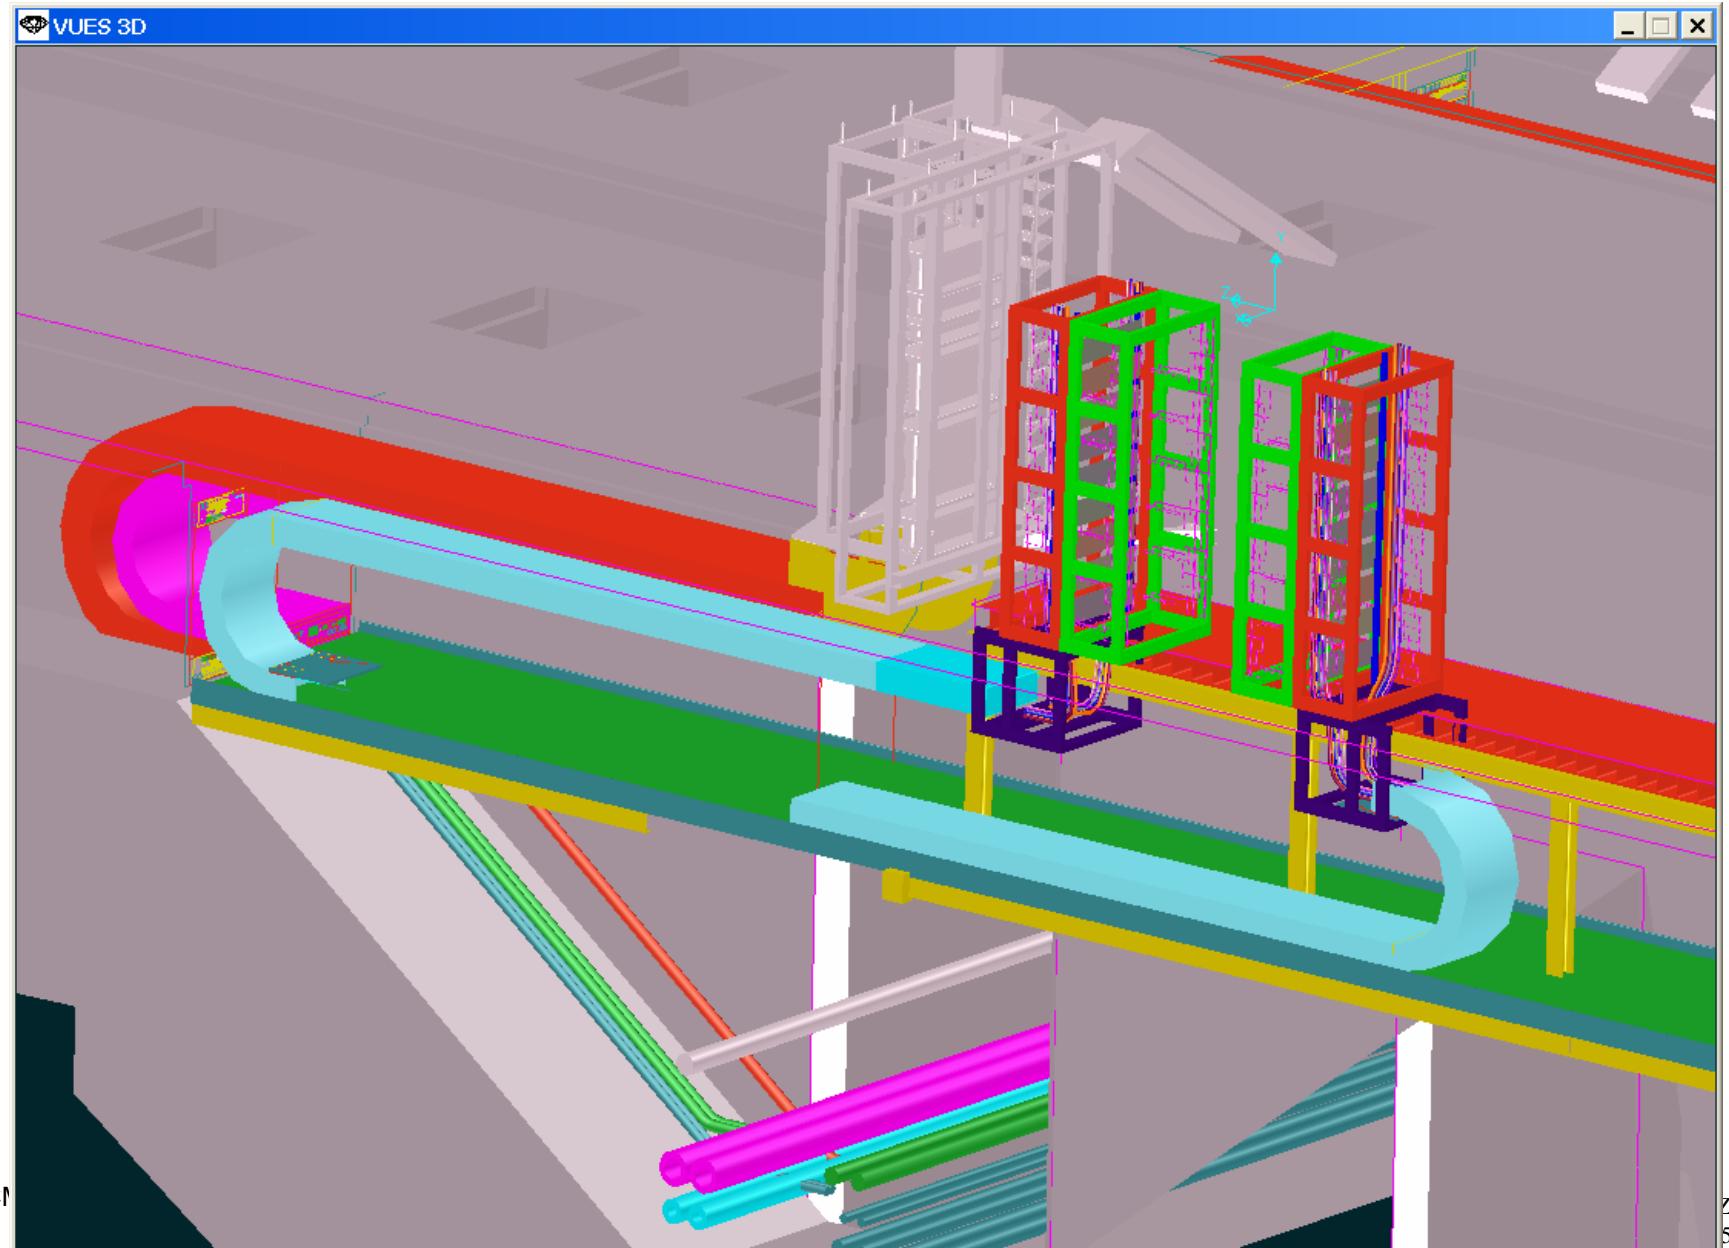

Lower YE+1 move to far Z+

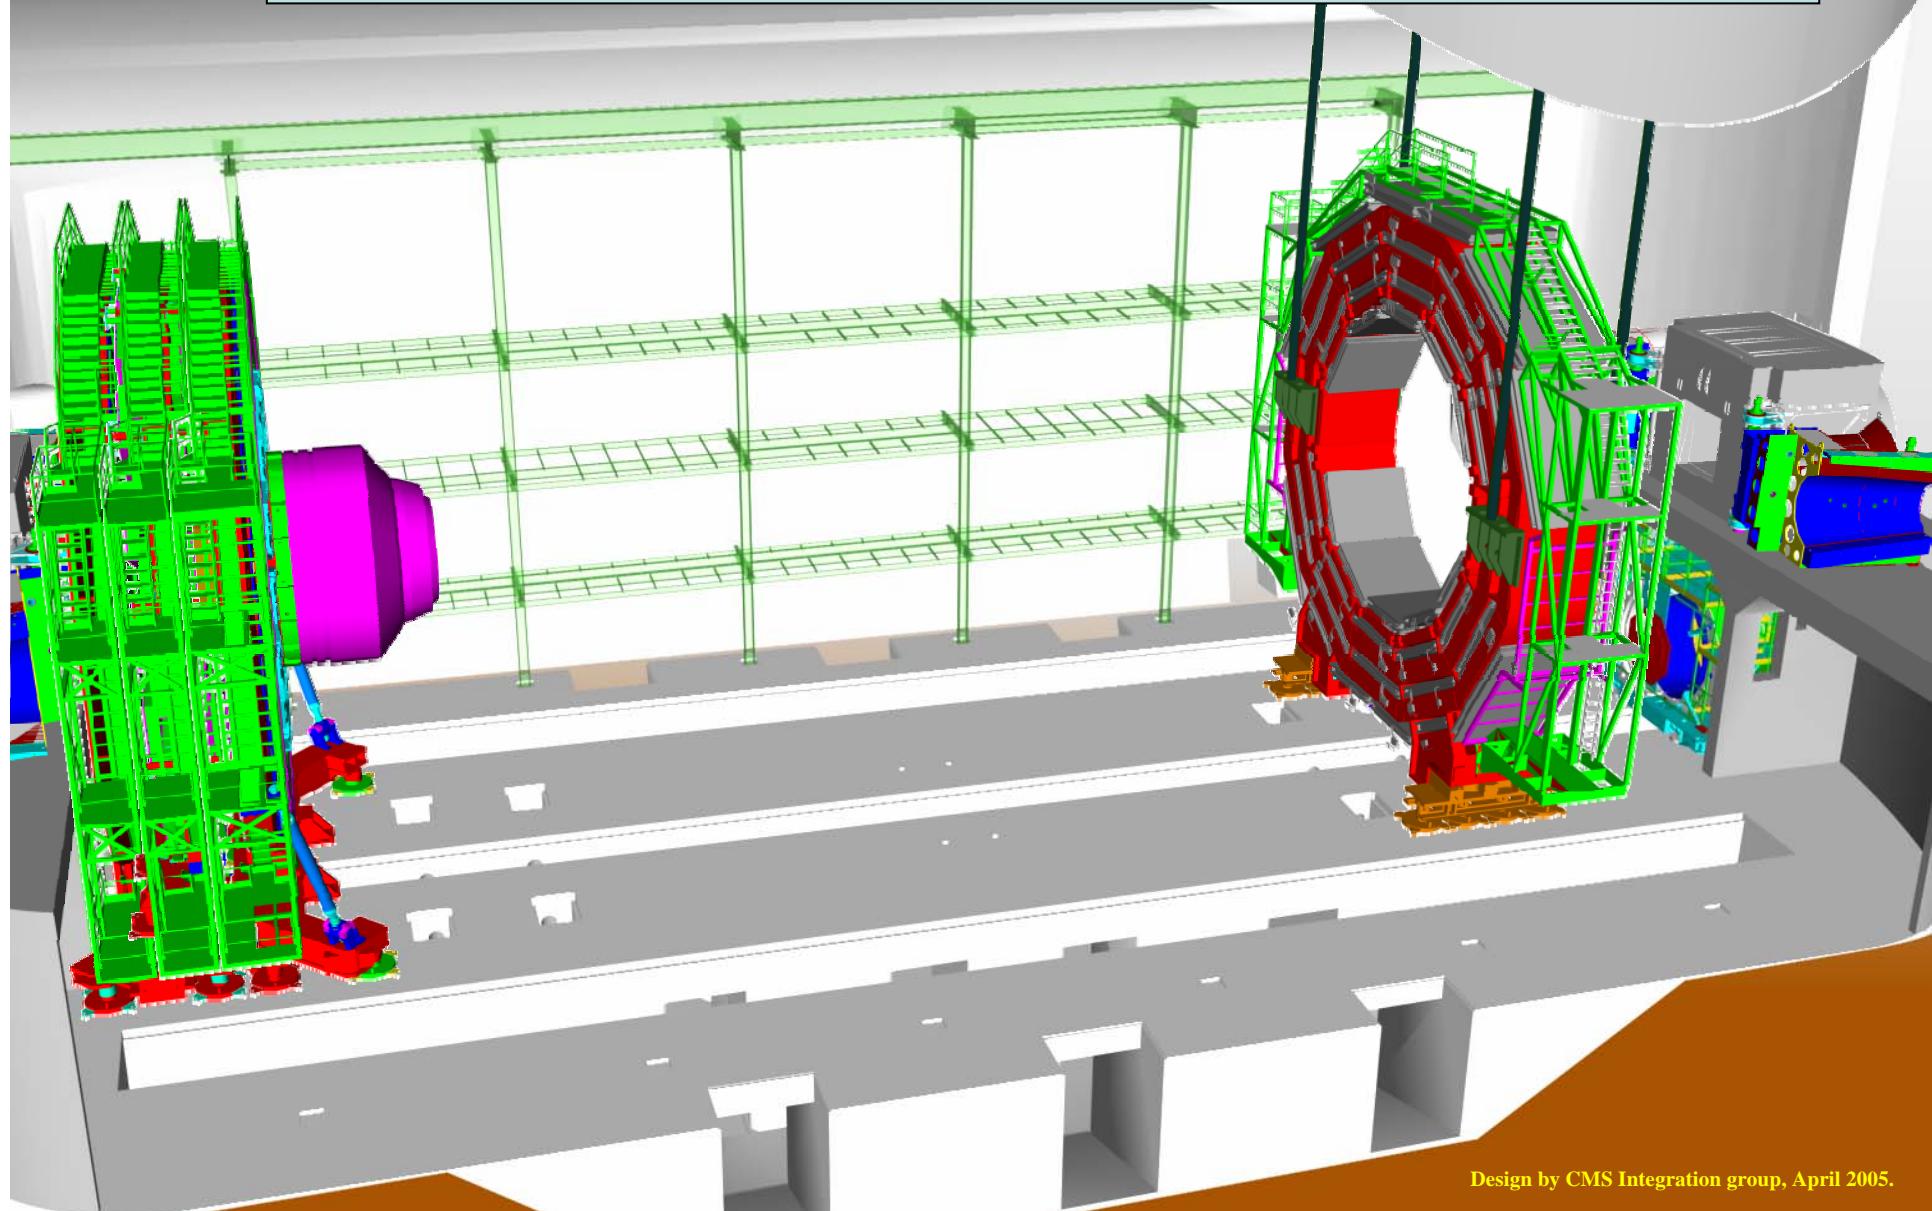

Design by CMS Integration group, April 2005.

Elements can be connected to cable chains

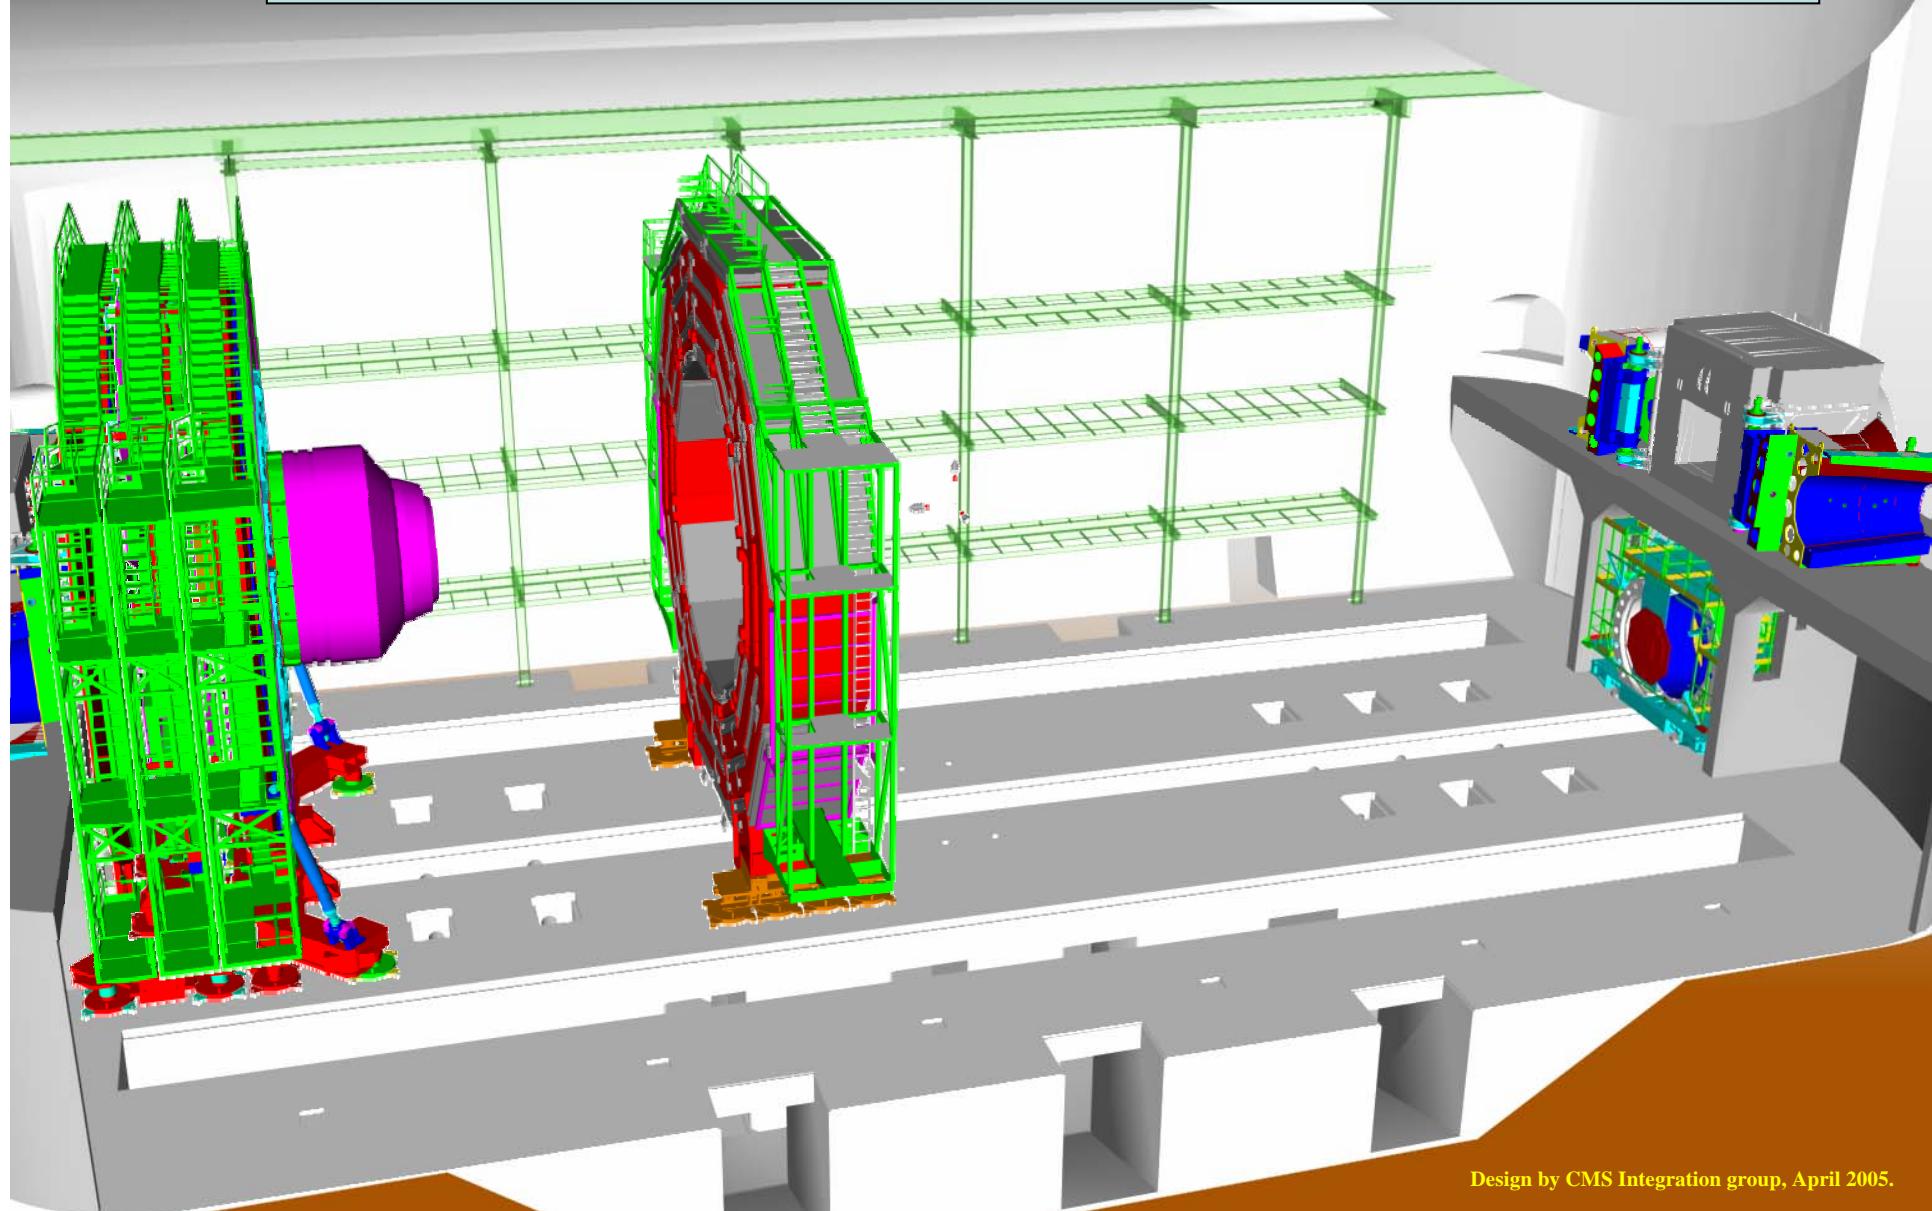

Lower YB+2 move to far Z+

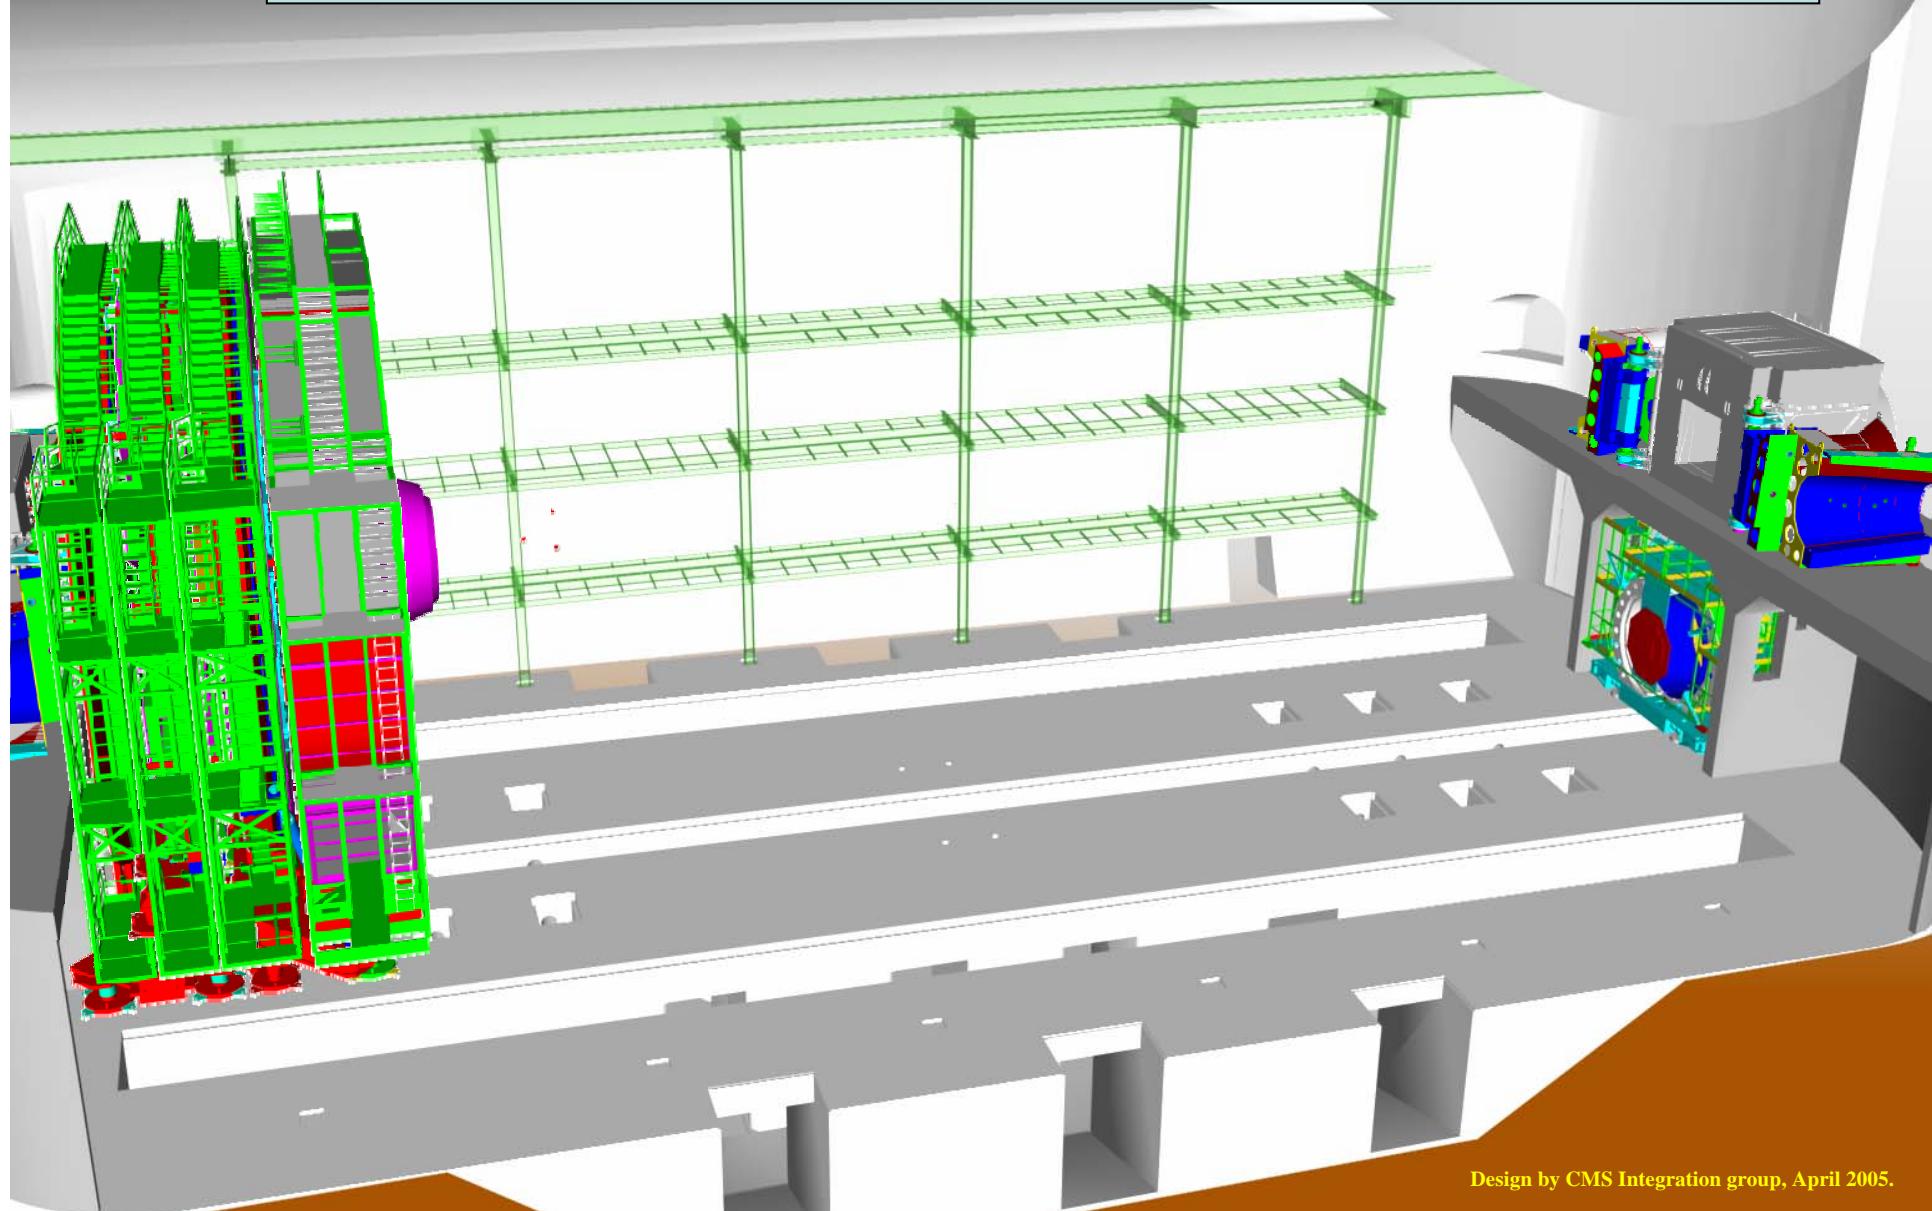

Design by CMS Integration group, April 2005.

Lower YB+2 move to far Z+

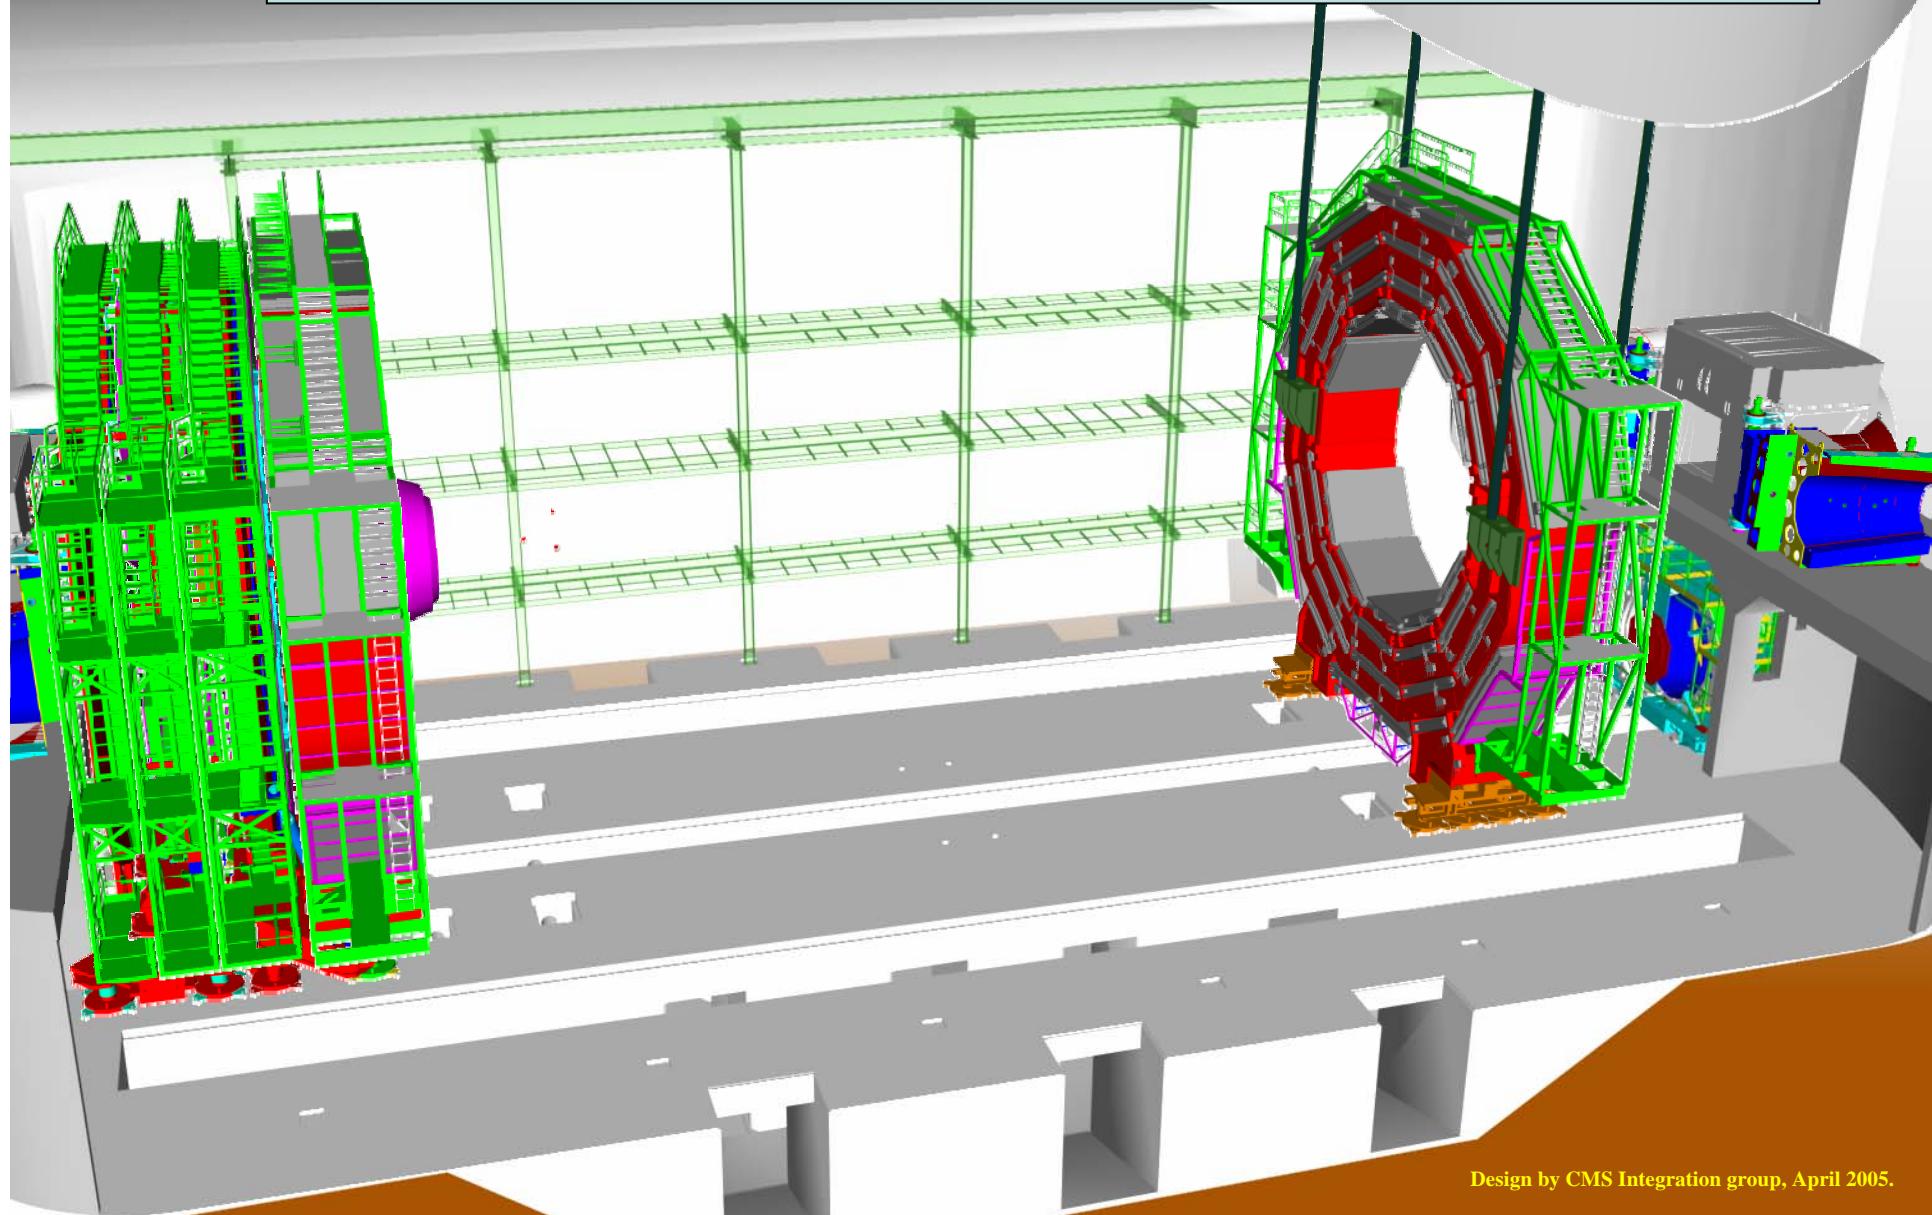

Design by CMS Integration group, April 2005.

Lower YB+2 move to far Z+

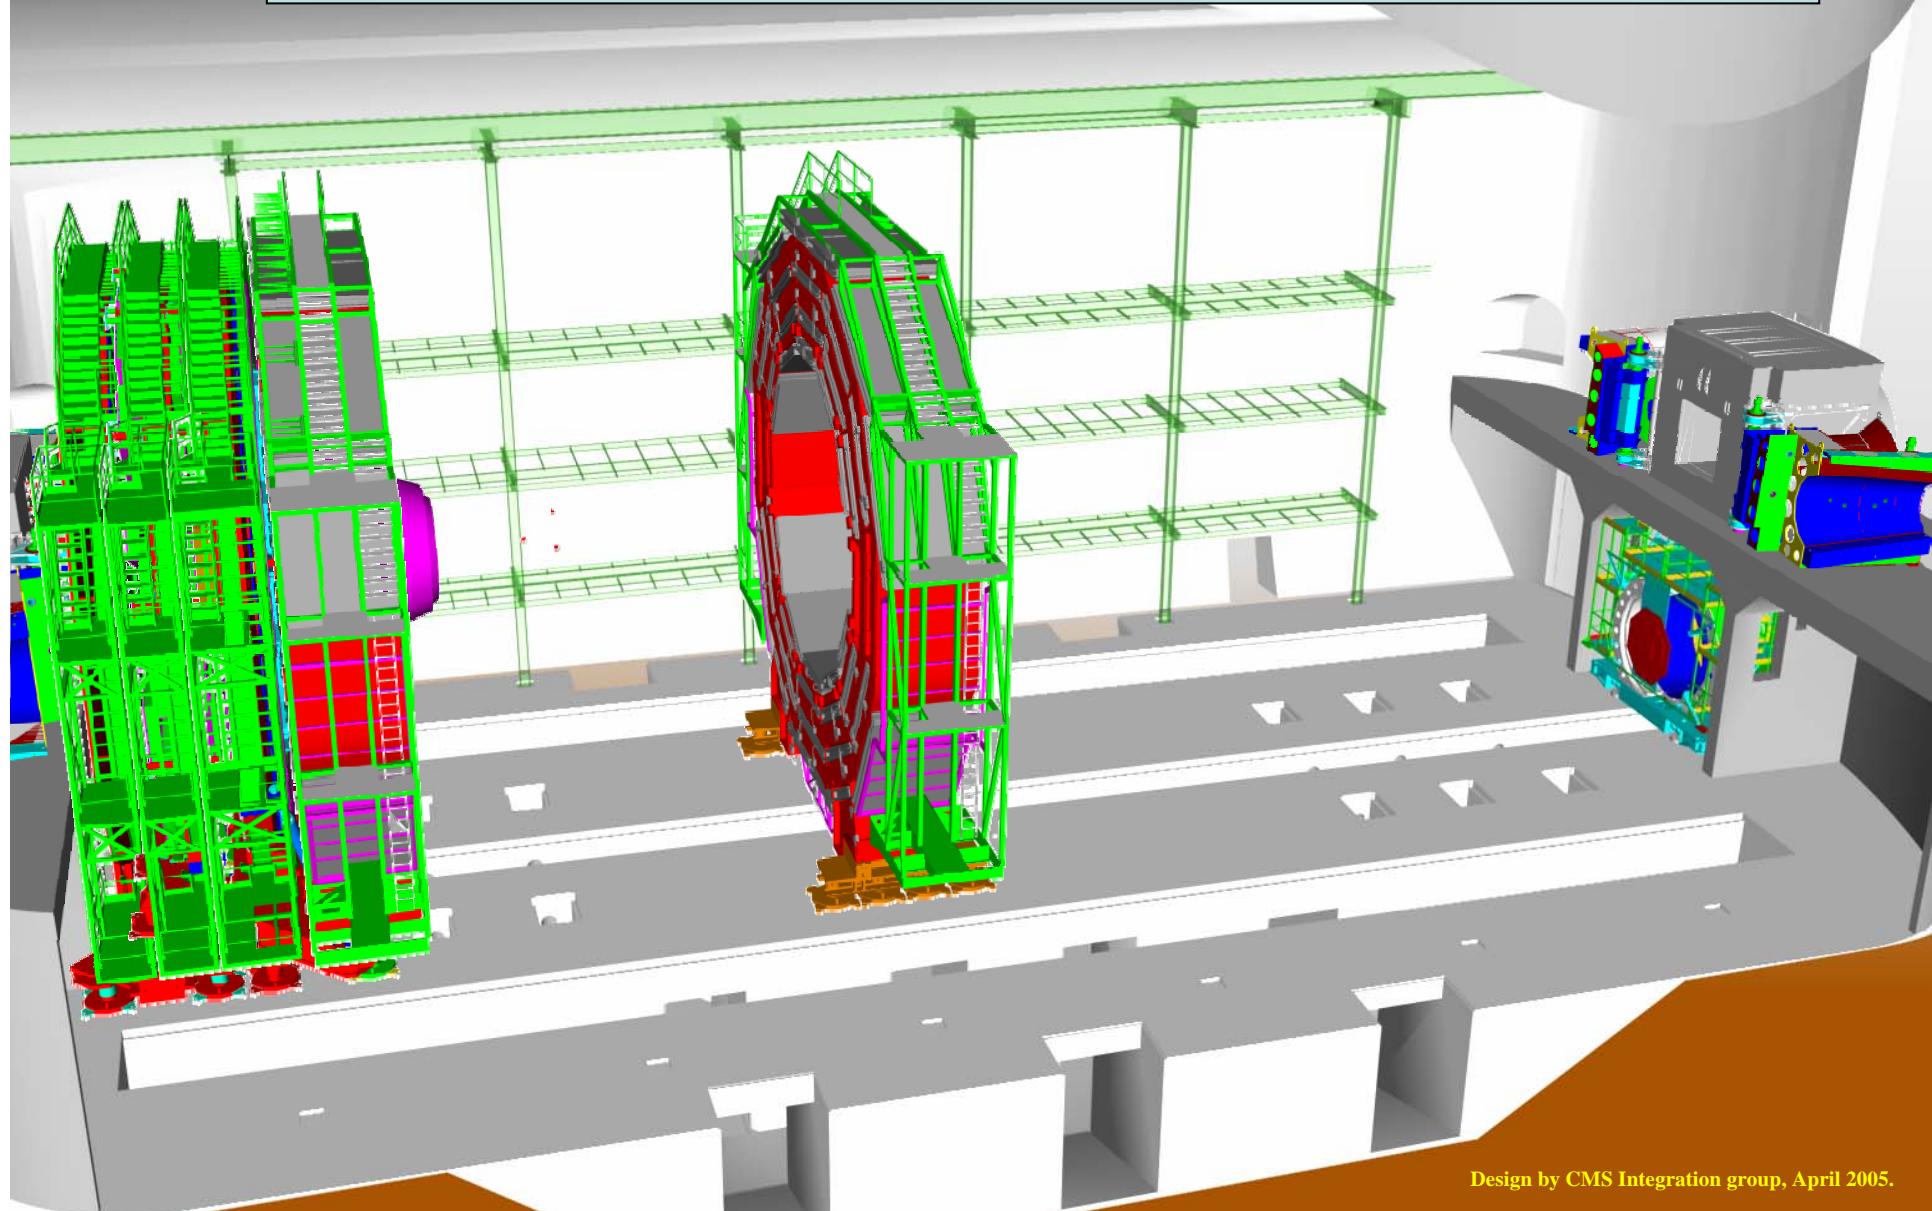

Design by CMS Integration group, April 2005.

Lower YB+1 move to far Z+

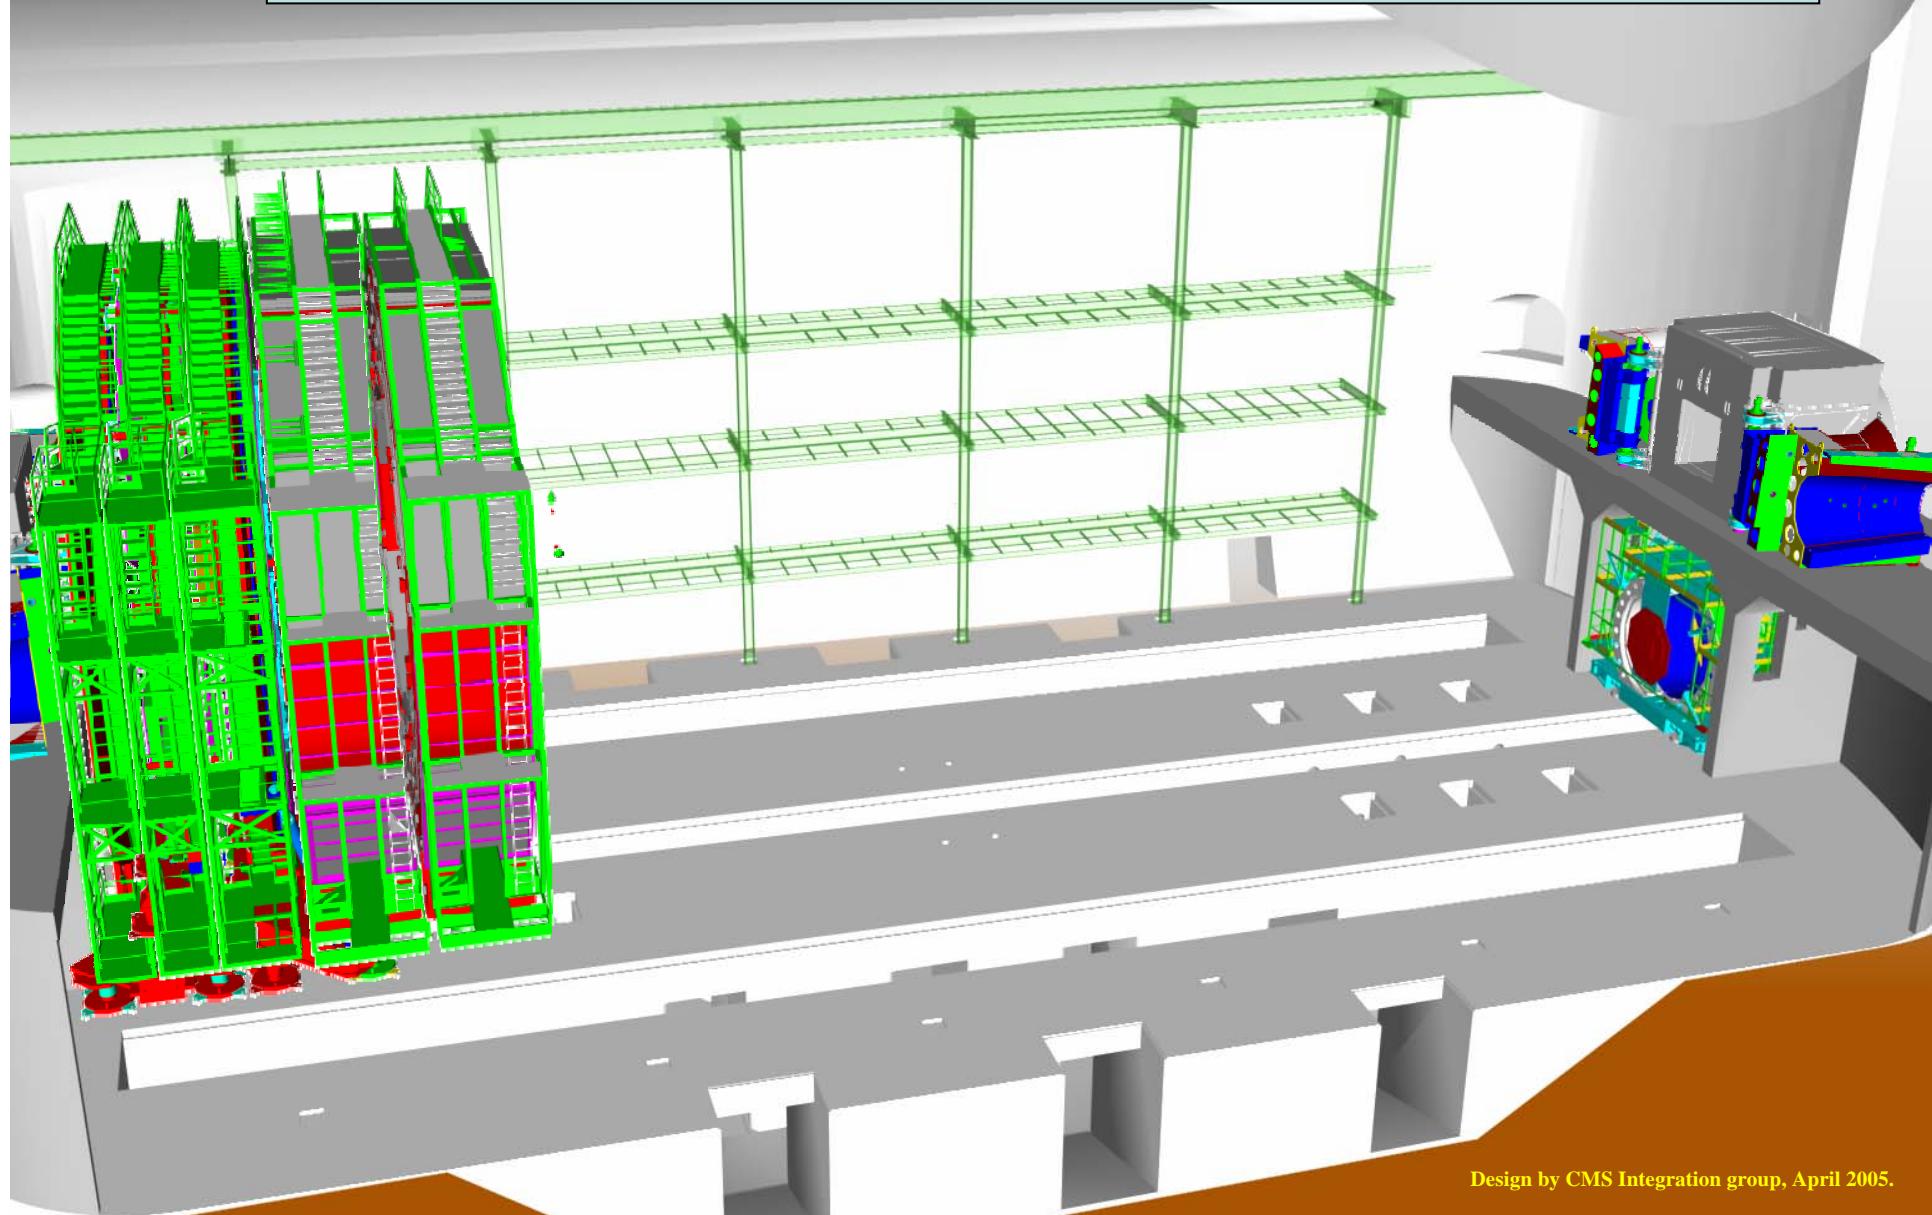

Design by CMS Integration group, April 2005.

Lower YB+1 move to far Z+

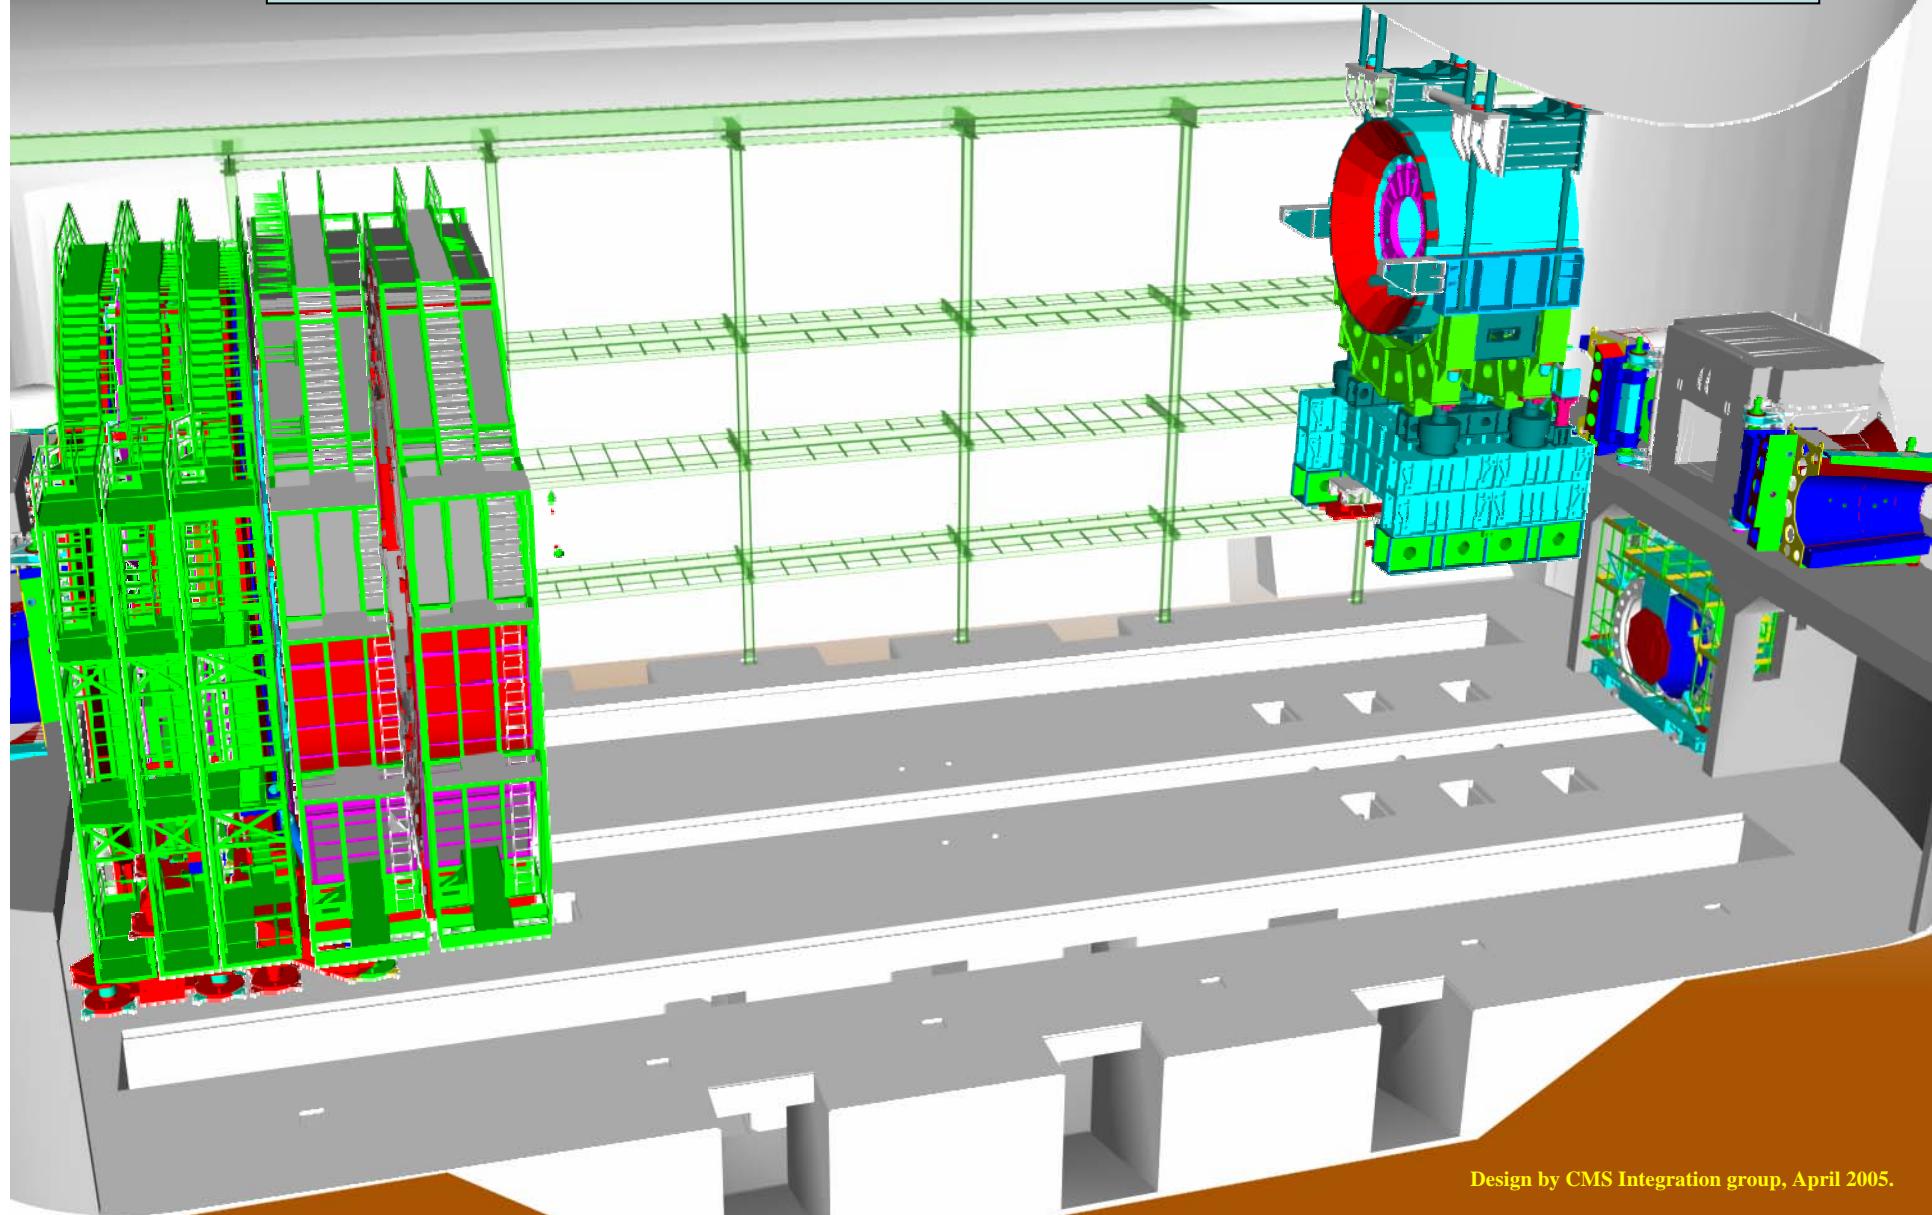

Design by CMS Integration group, April 2005.

Lower YB+1 move to far Z+

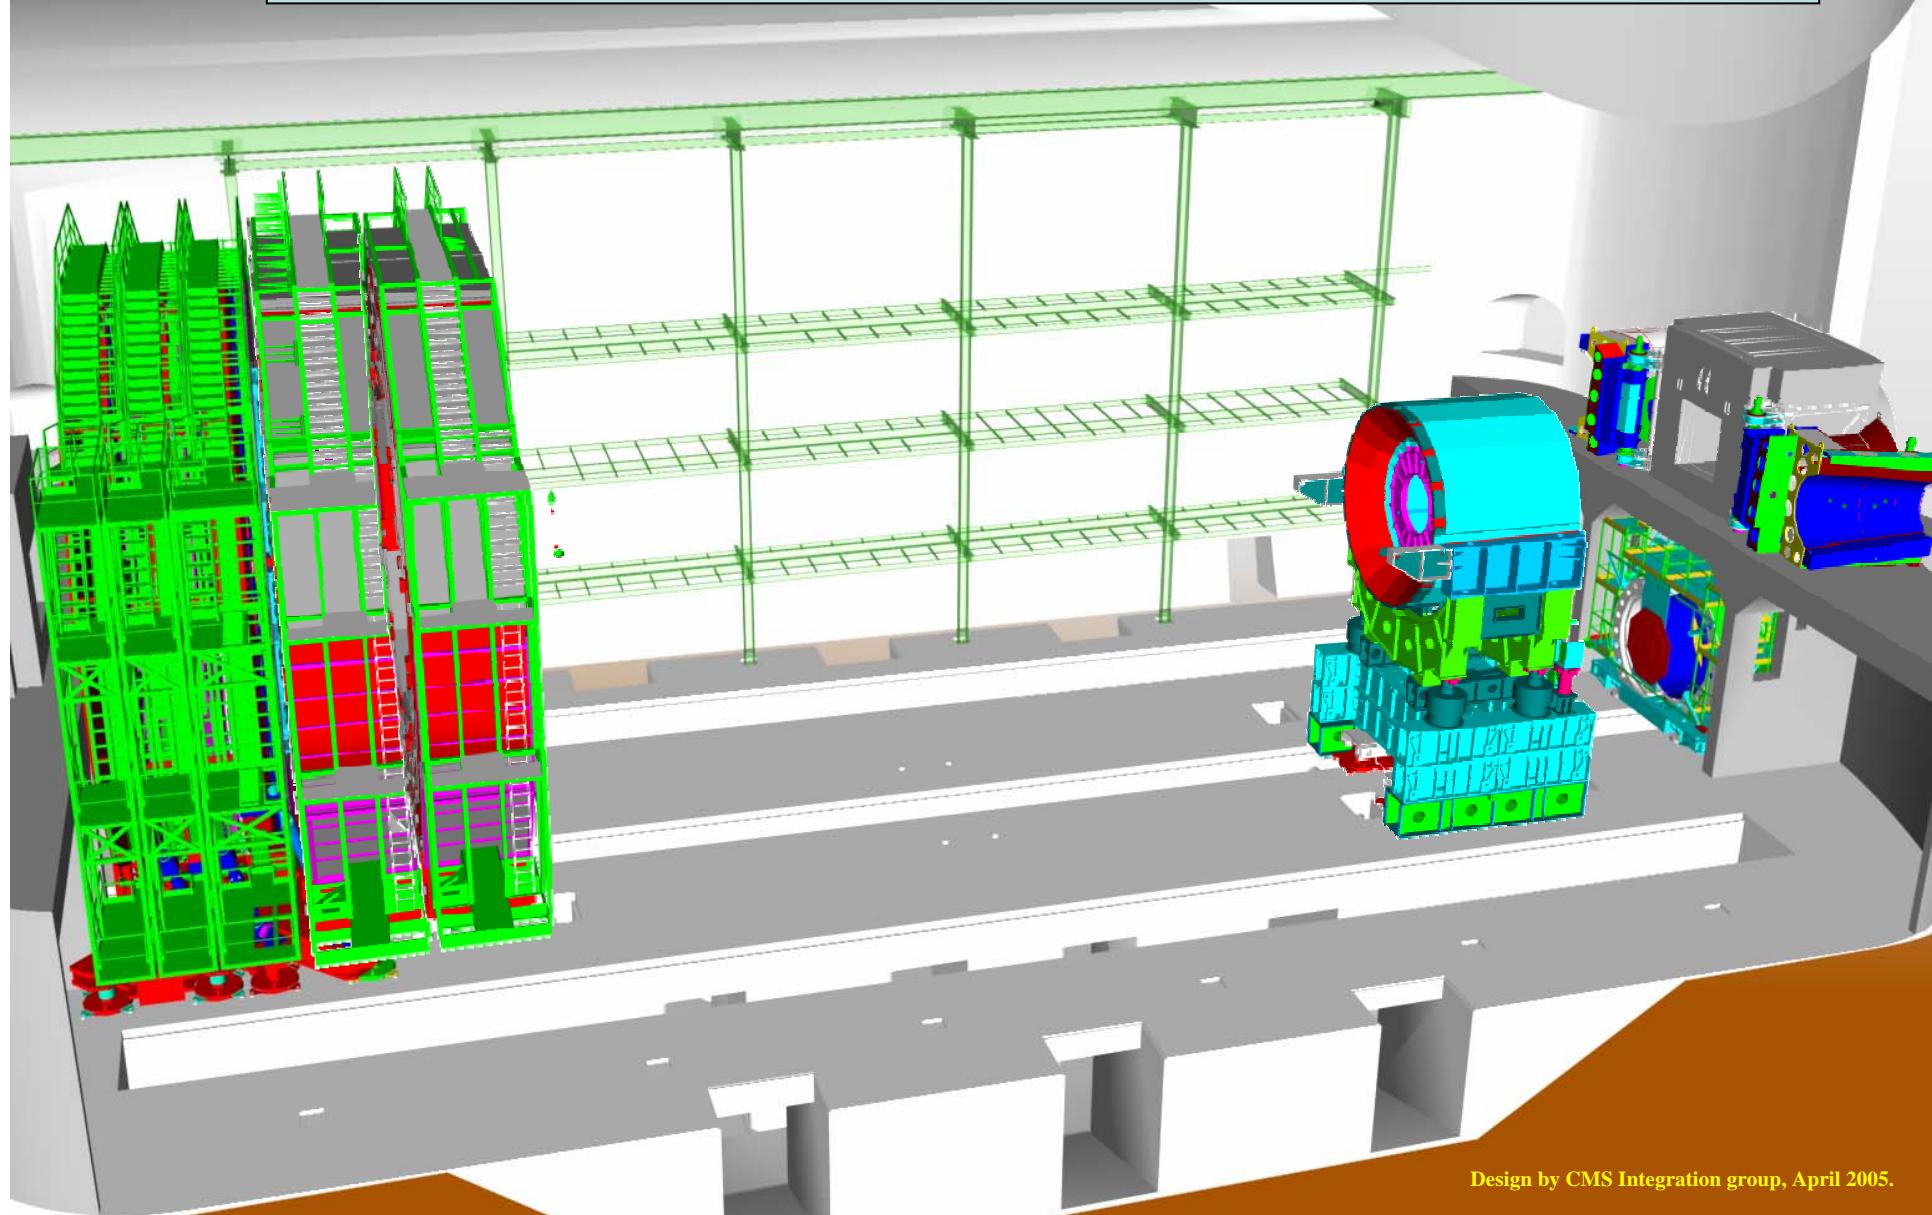

Design by CMS Integration group, April 2005.

Lower HB+ move to far Z+

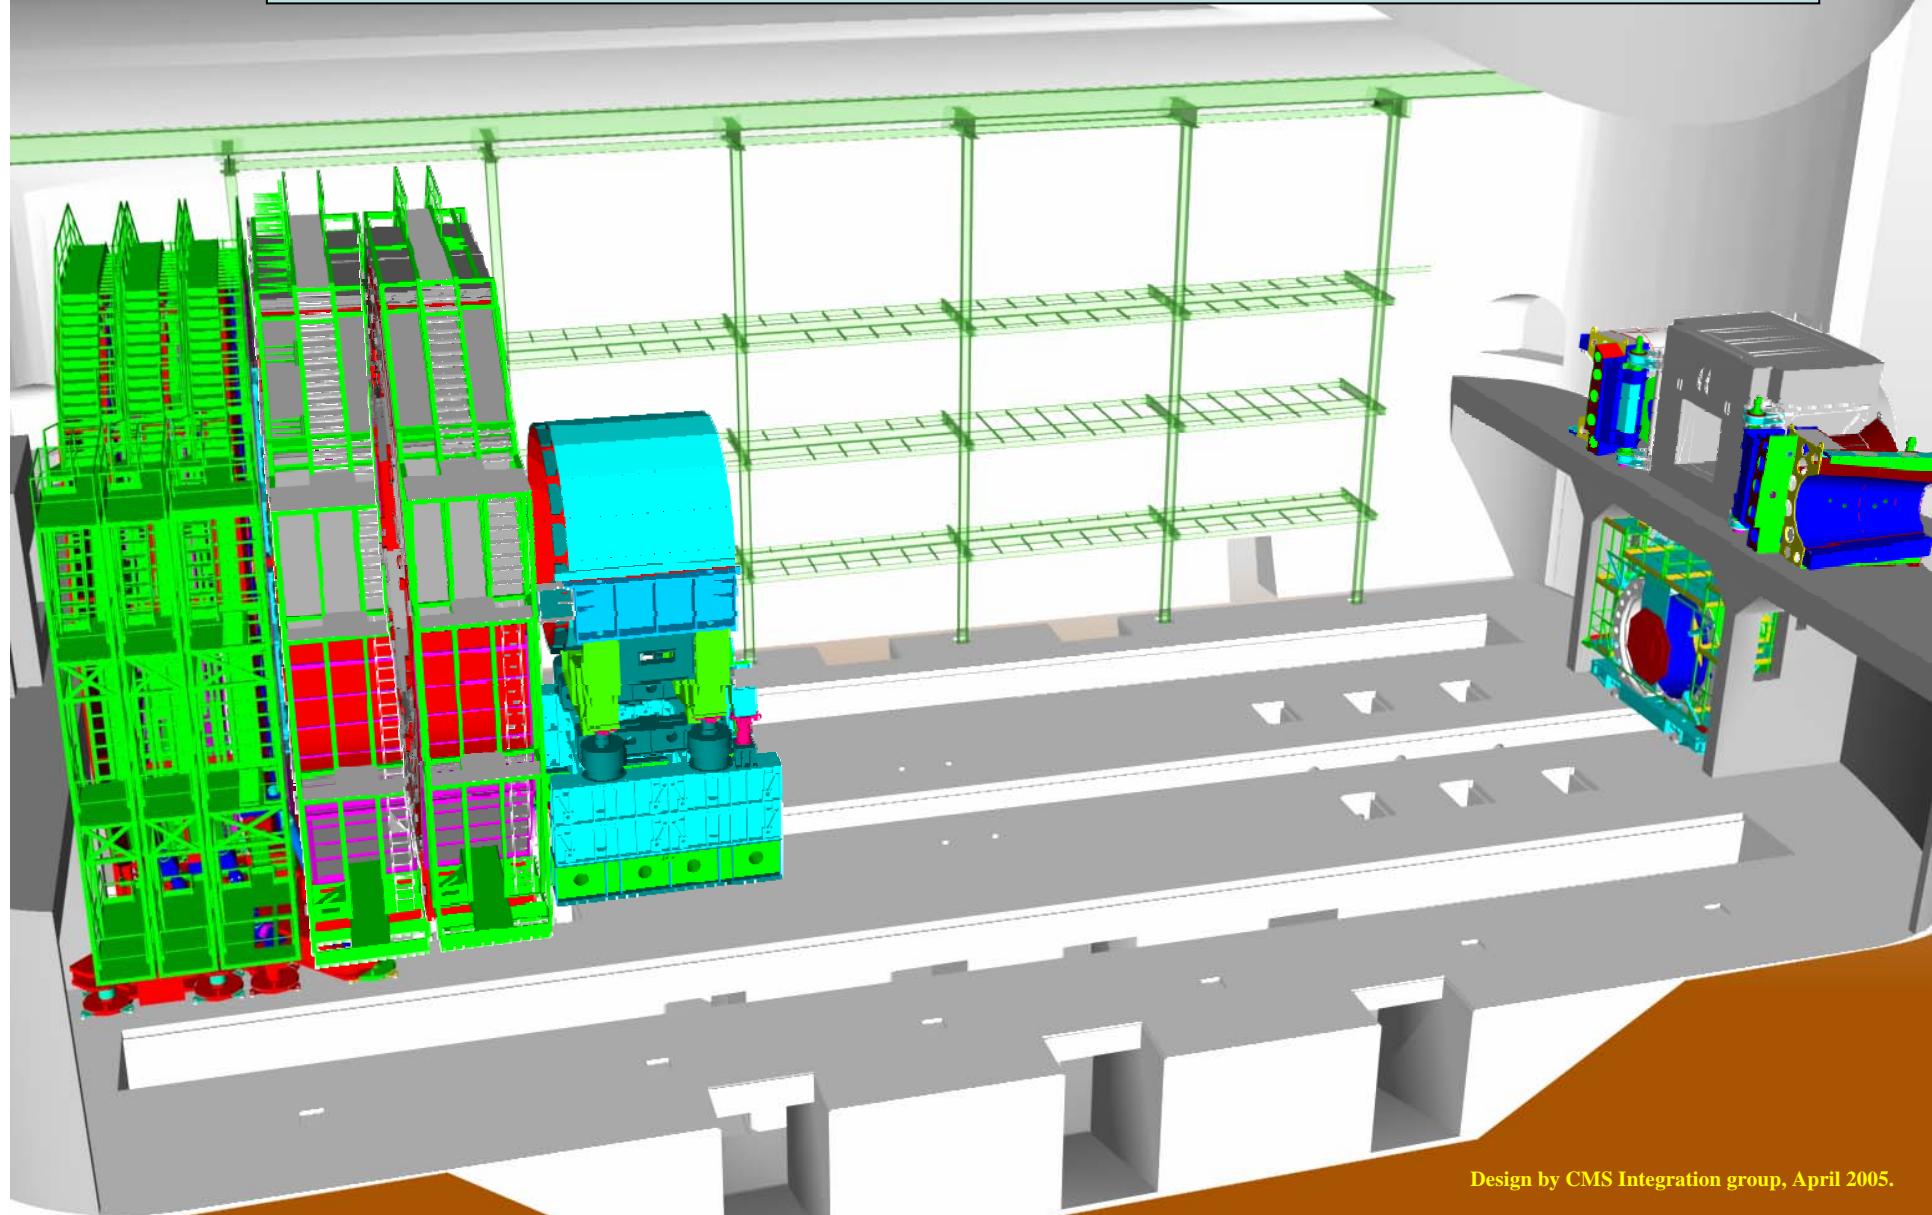

Design by CMS Integration group, April 2005.

Lower HB+ move to far Z+

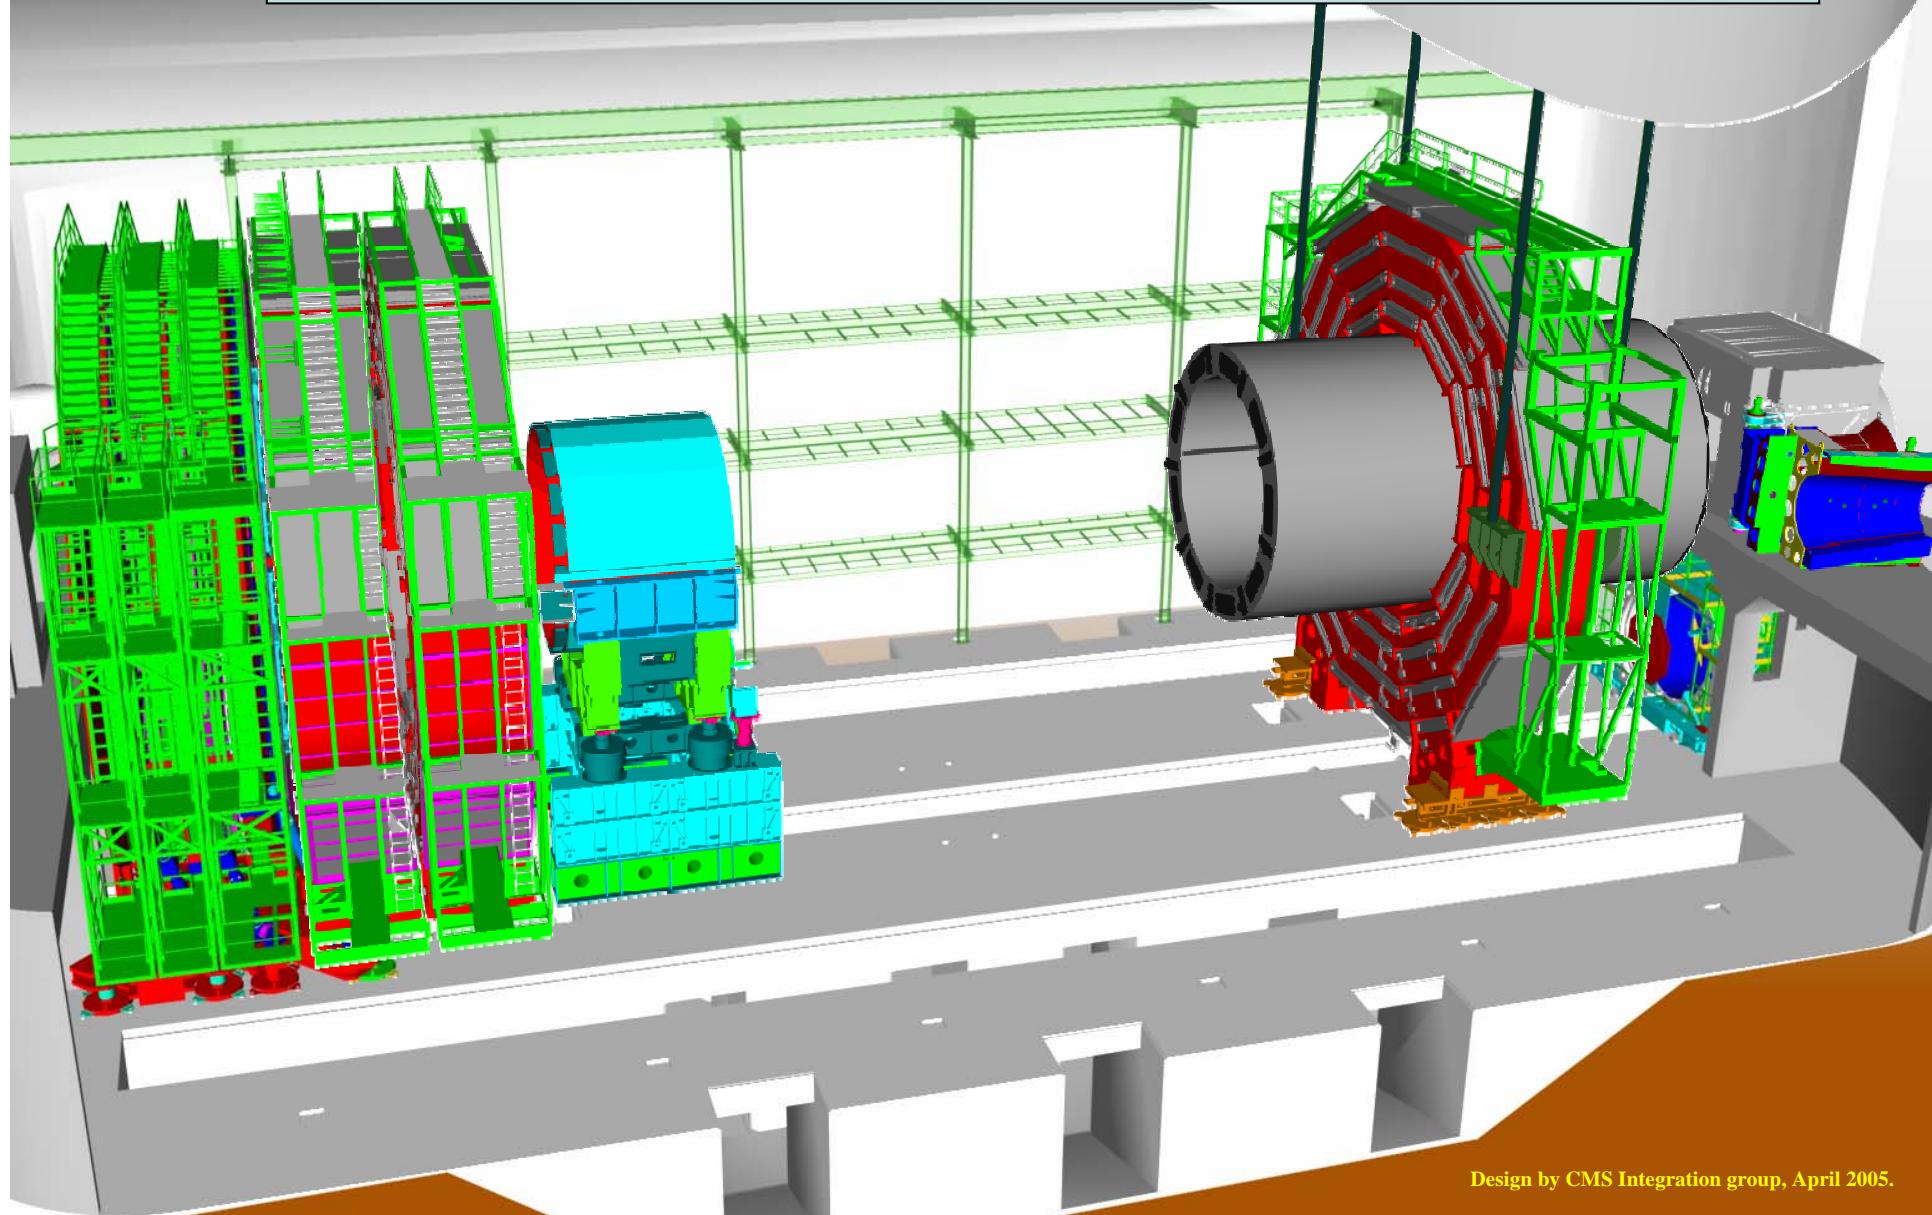

Design by CMS Integration group, April 2005.

Lower HB+ move to far Z+

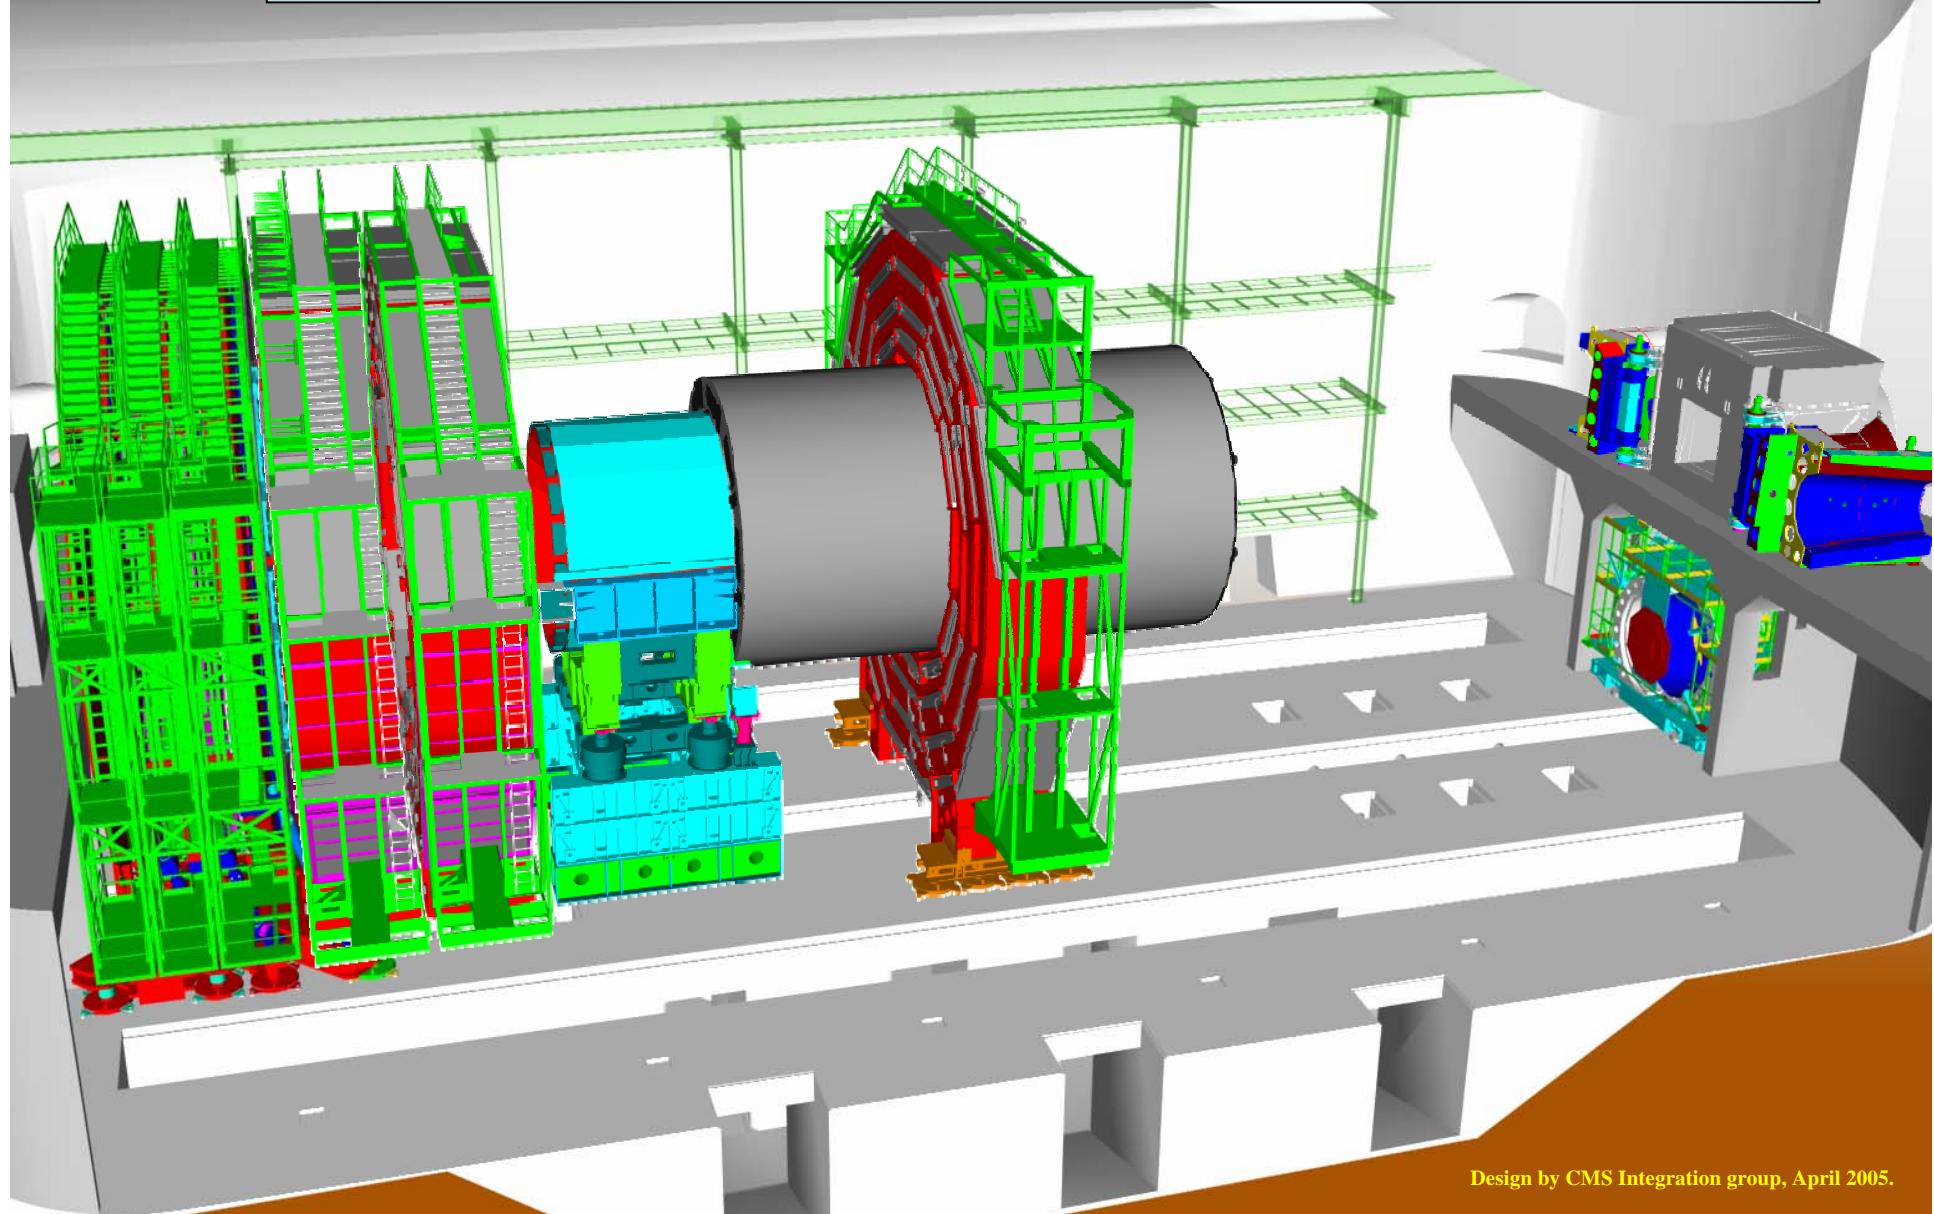

Design by CMS Integration group, April 2005.

Lower YB0 move to IP

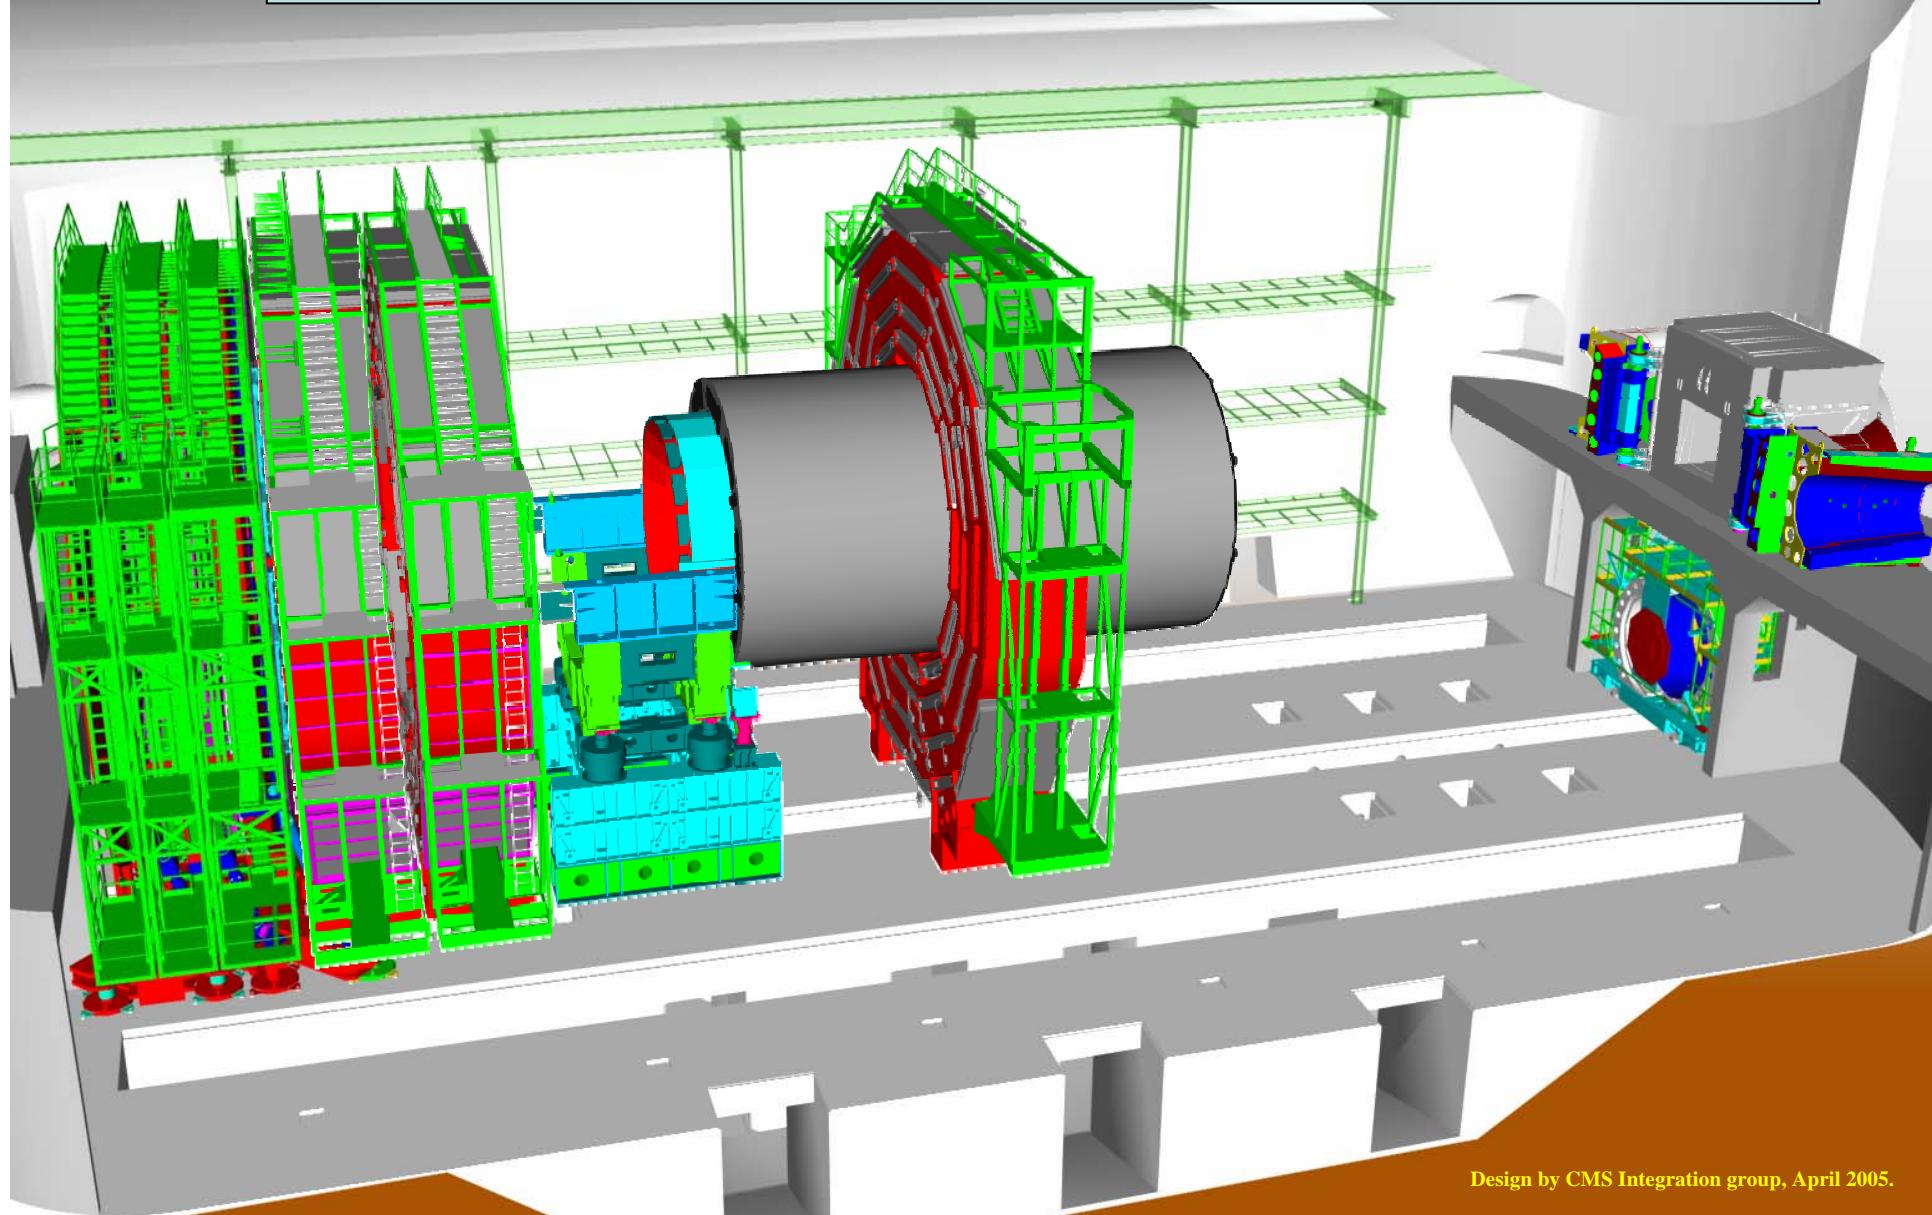

Design by CMS Integration group, April 2005.

Lower YB0 move to IP

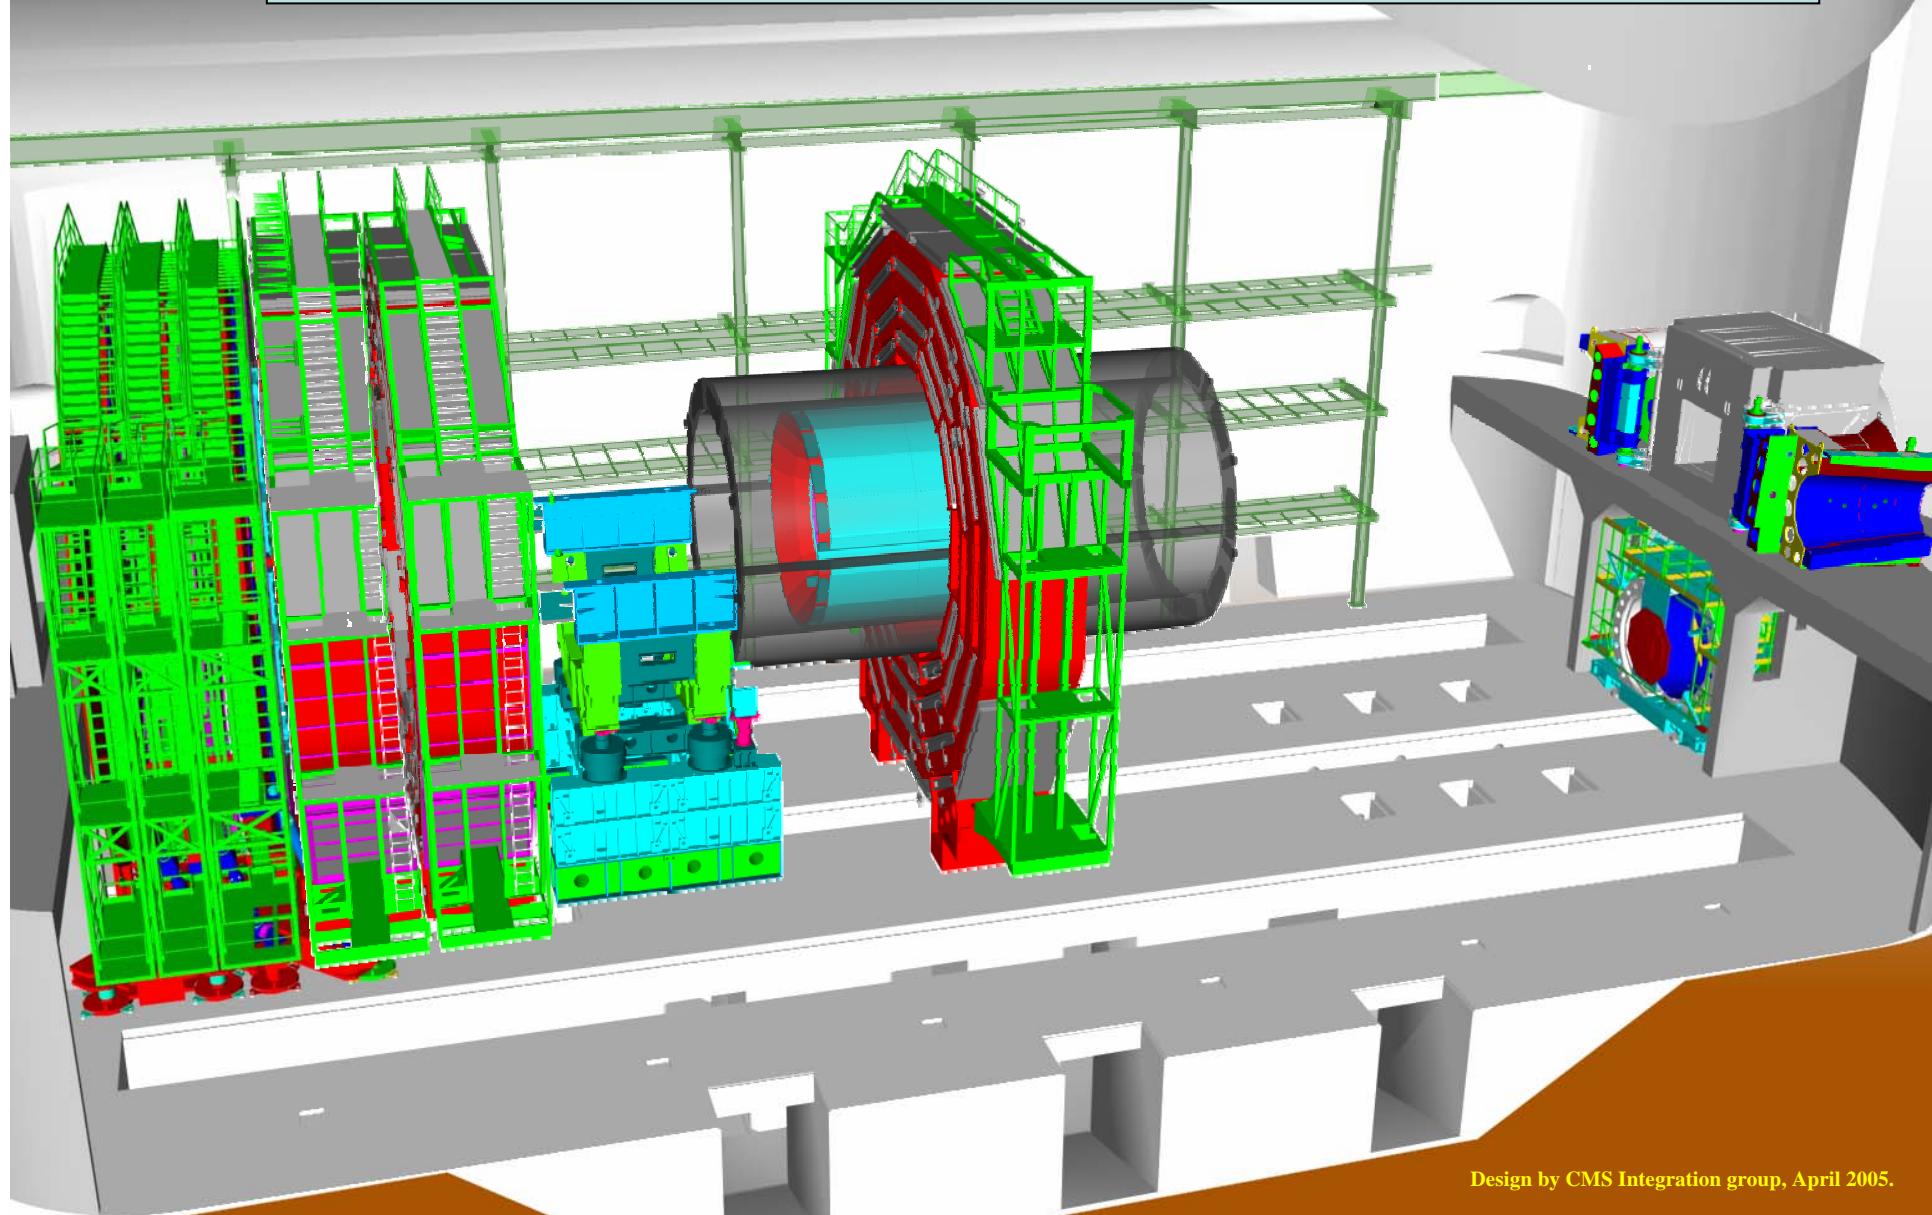

Design by CMS Integration group, April 2005.

Insert HB+ inside vacuum tank

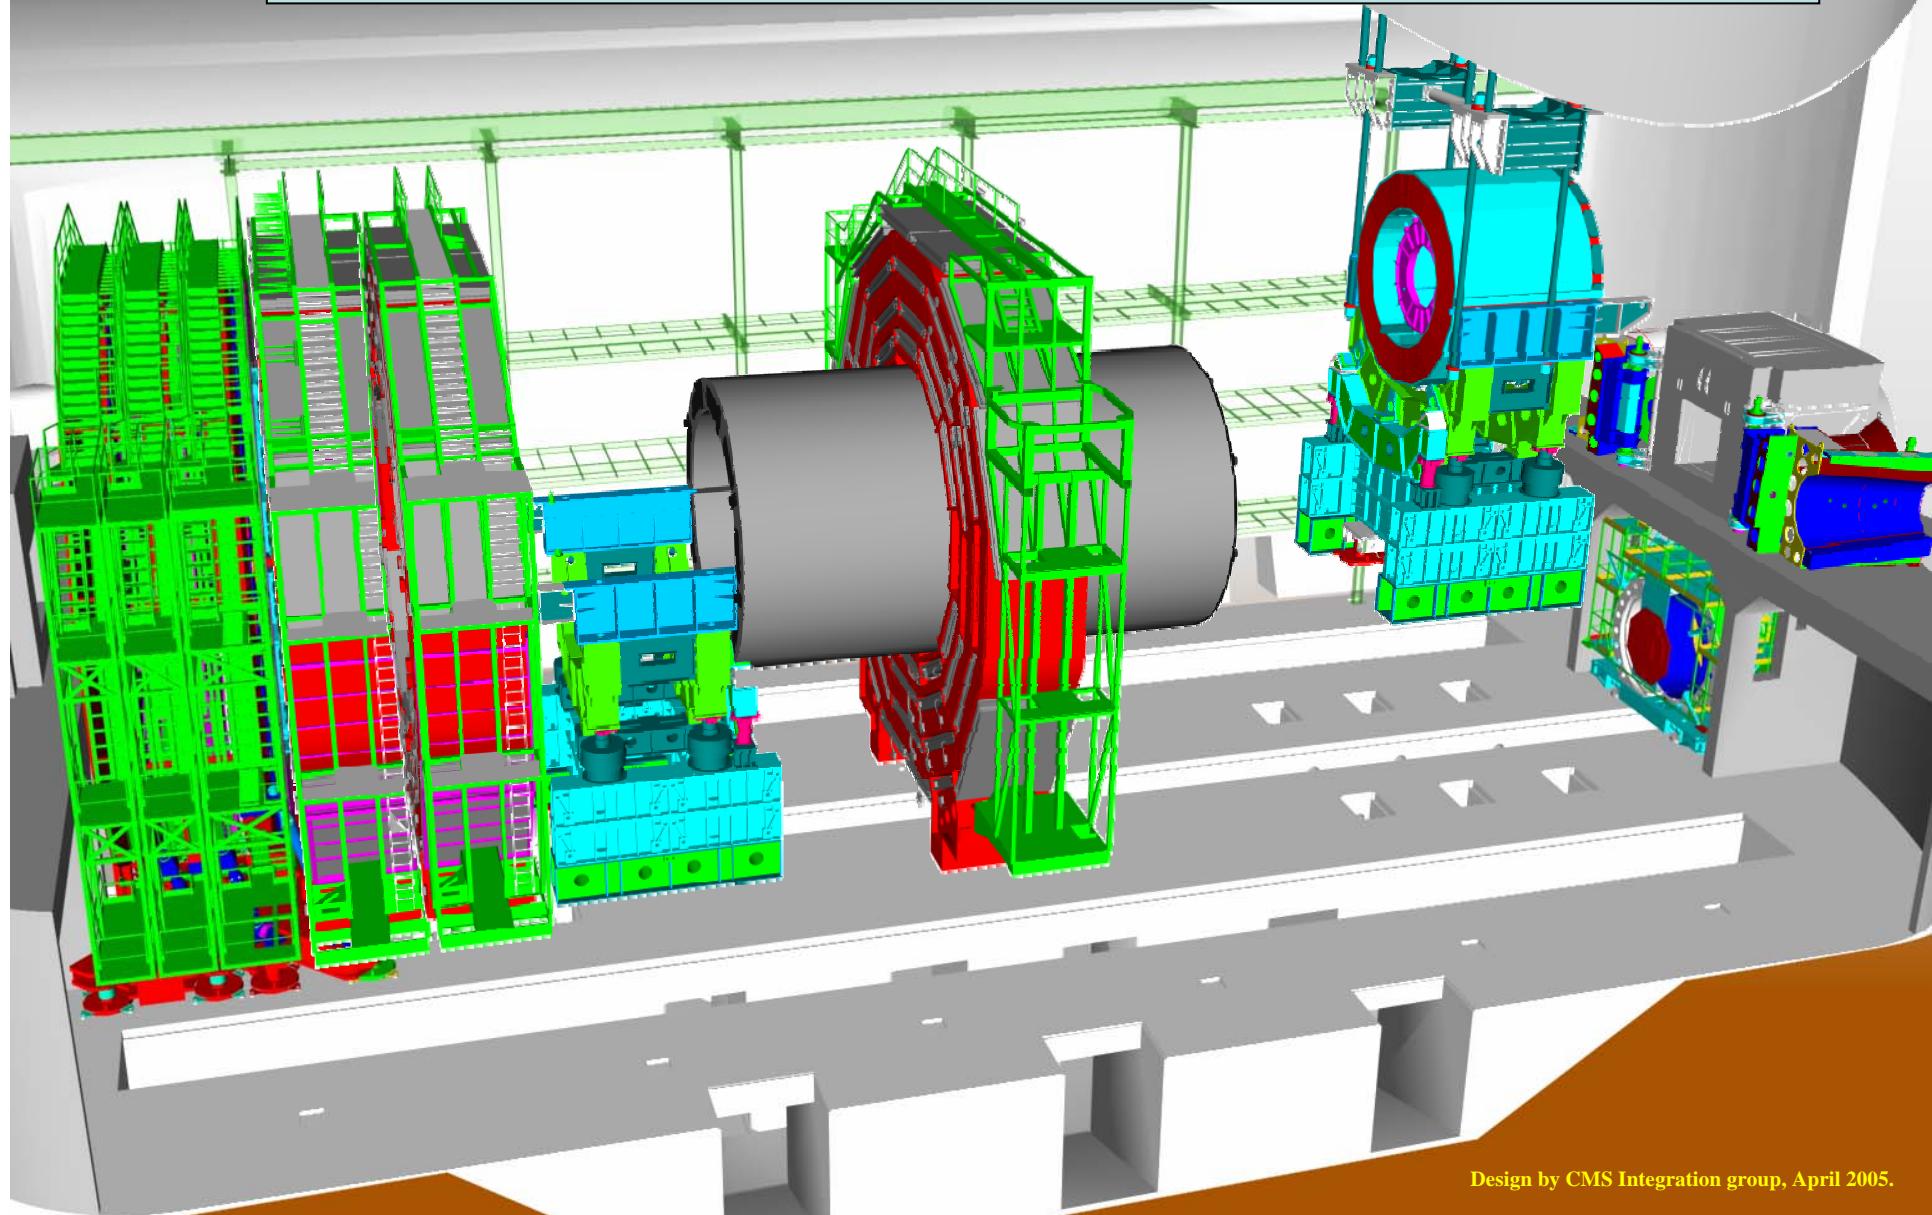

Design by CMS Integration group, April 2005.

Move HB+ inside vacuum tank

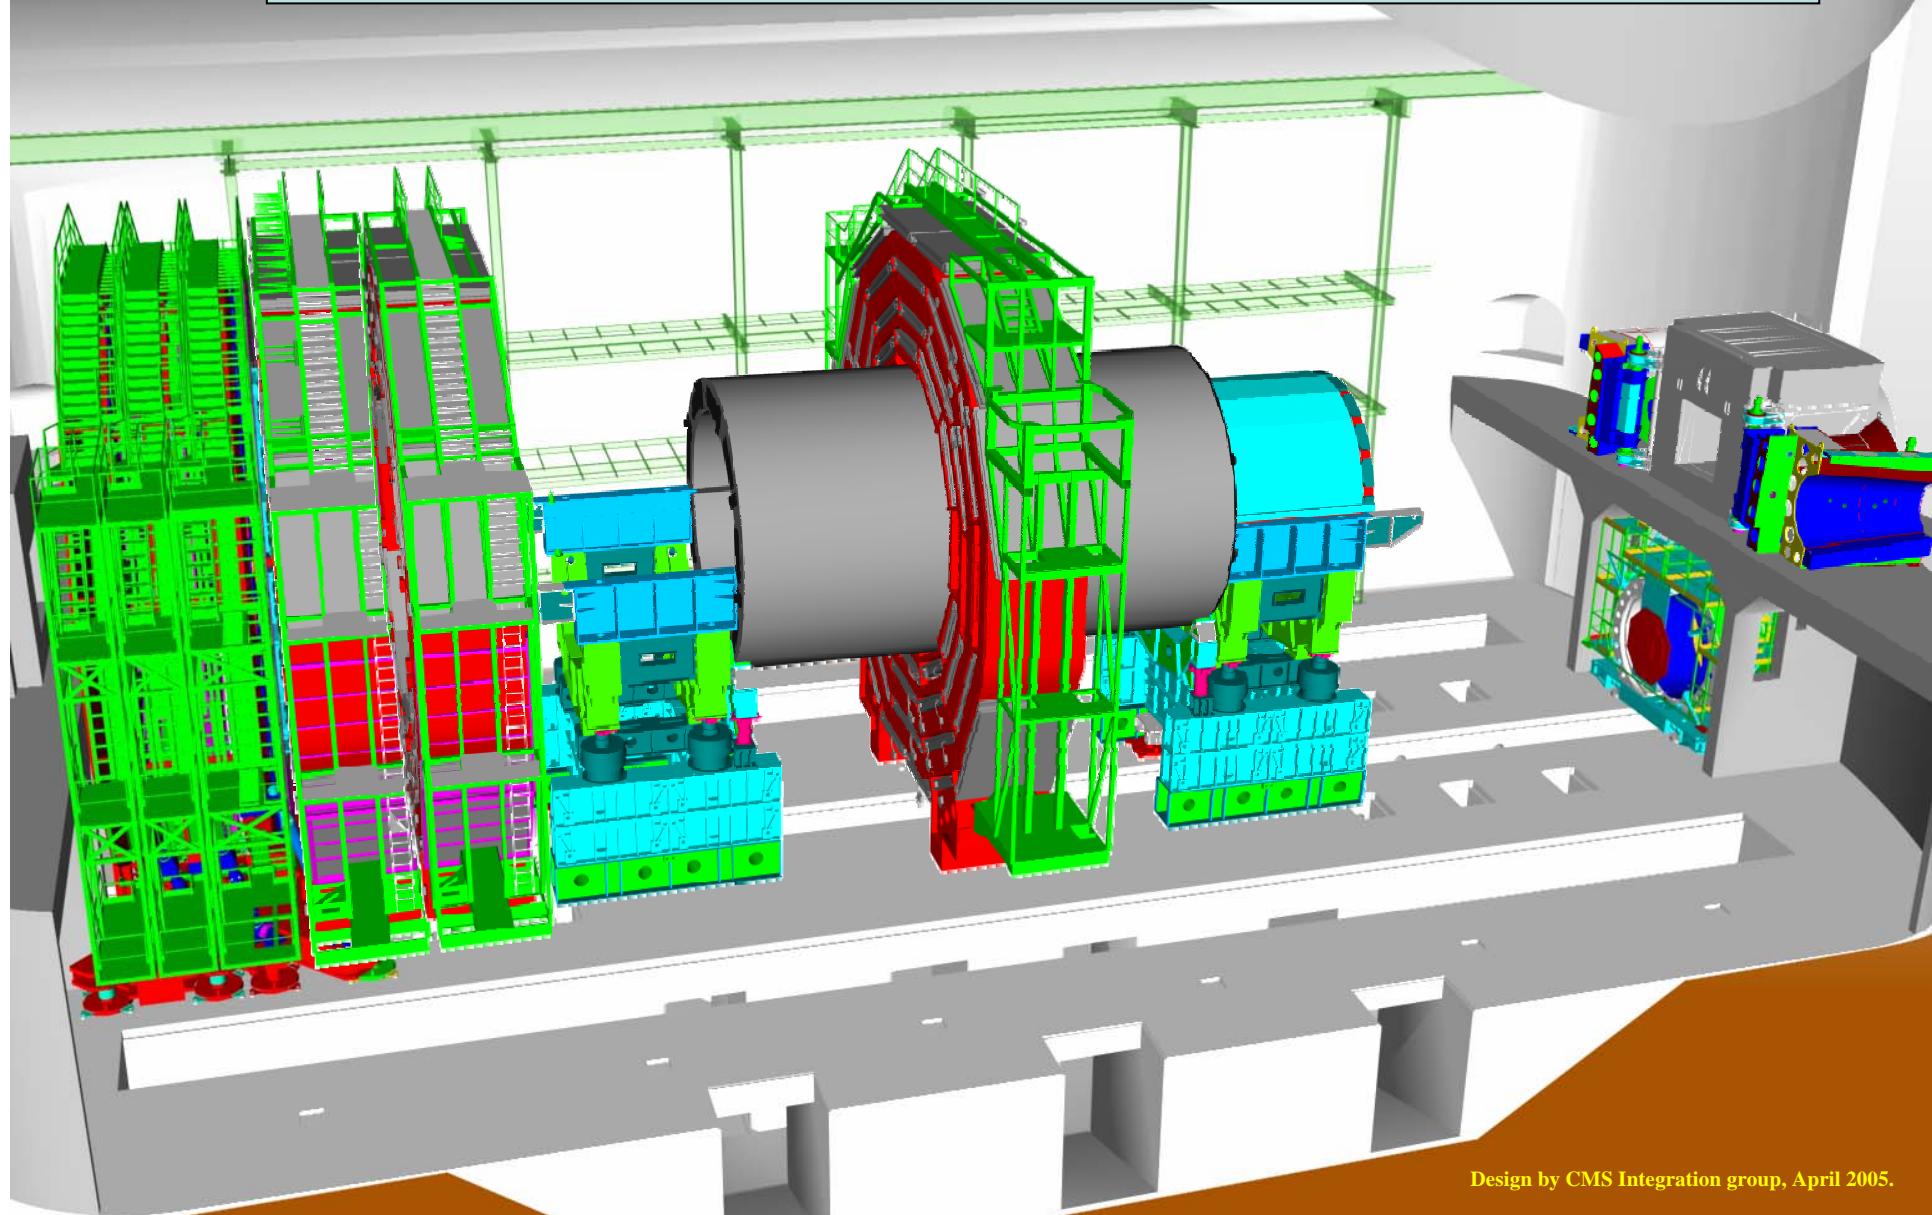

Design by CMS Integration group, April 2005.

Lower HB- move near YB0

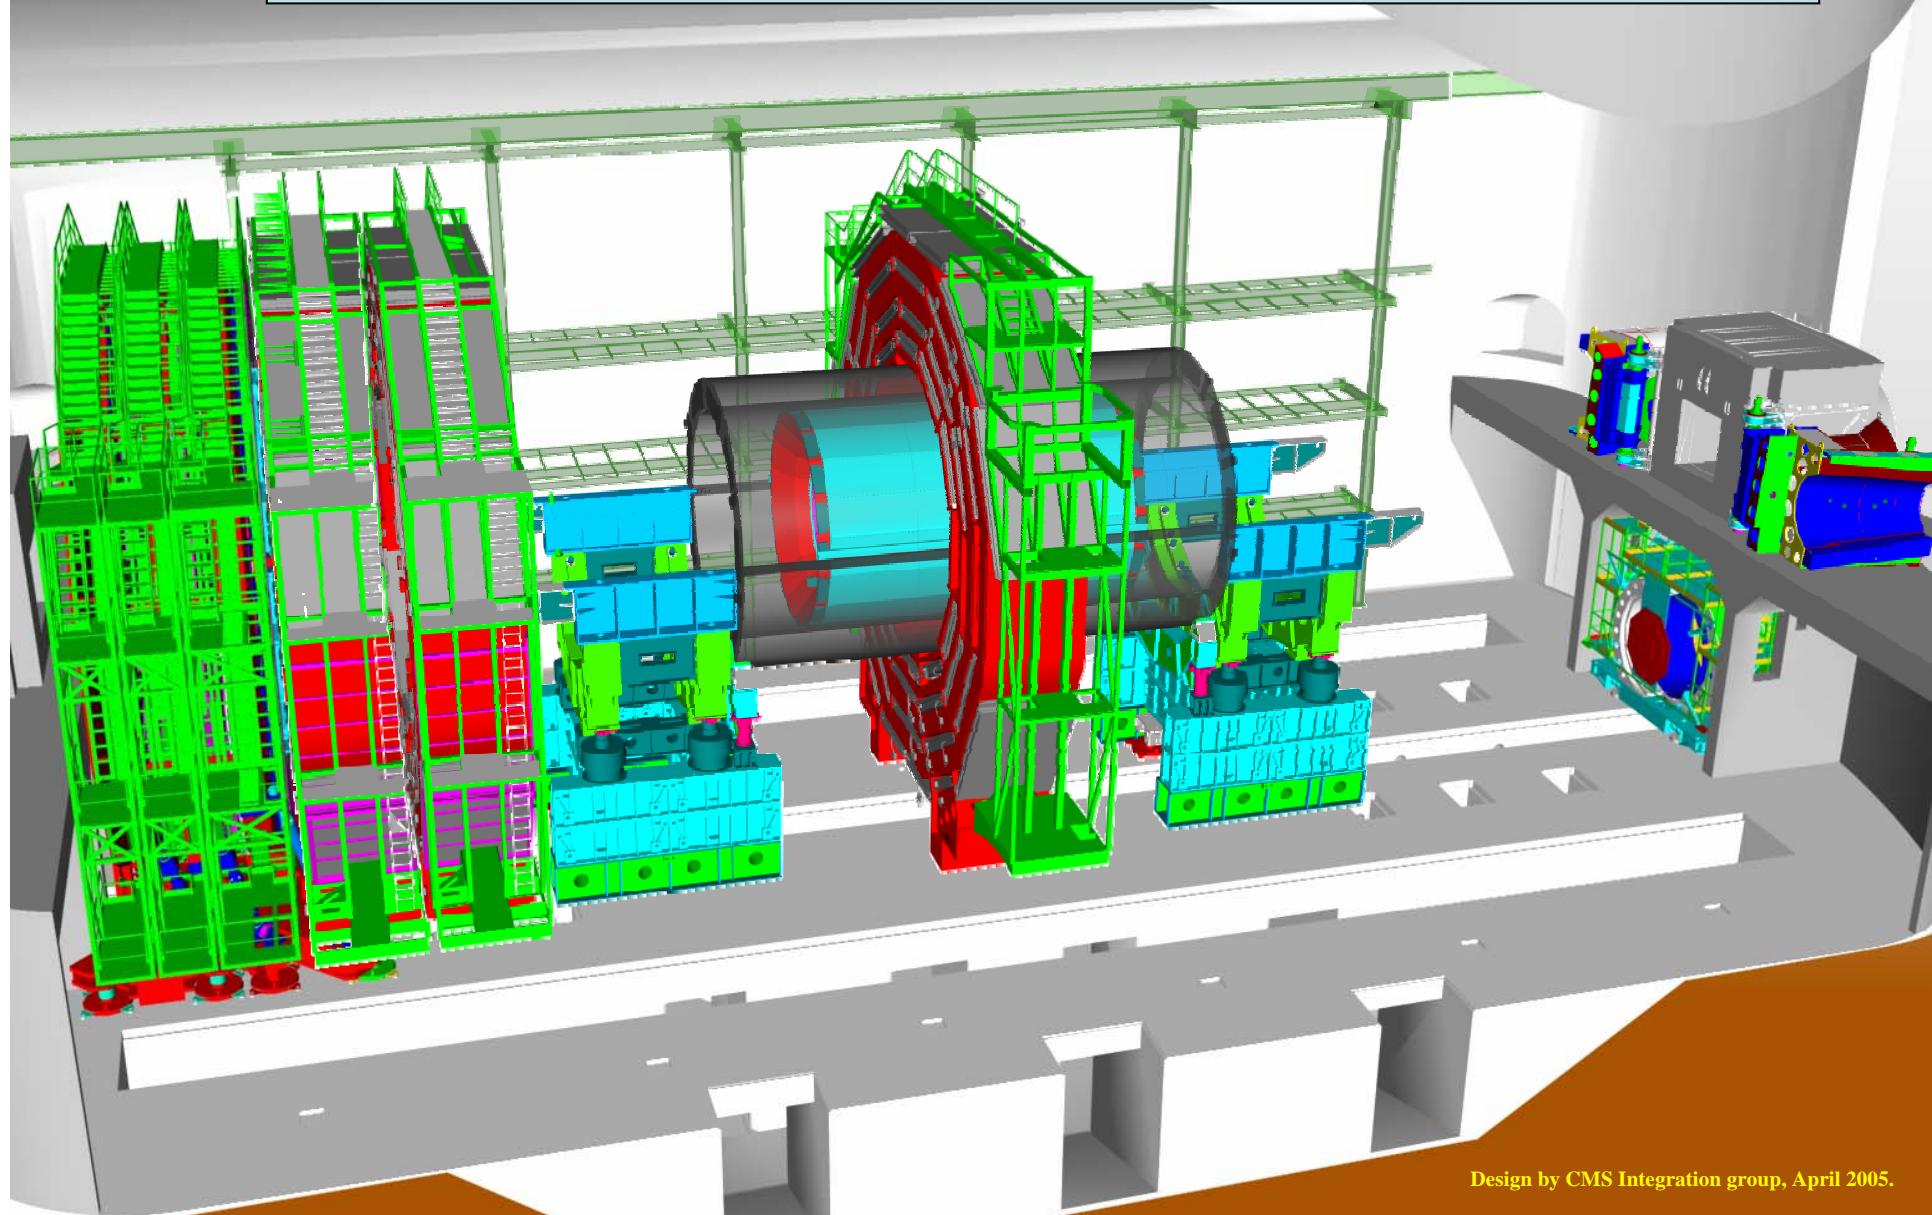

Design by CMS Integration group, April 2005.

Lower HB- insert in vacuum tank

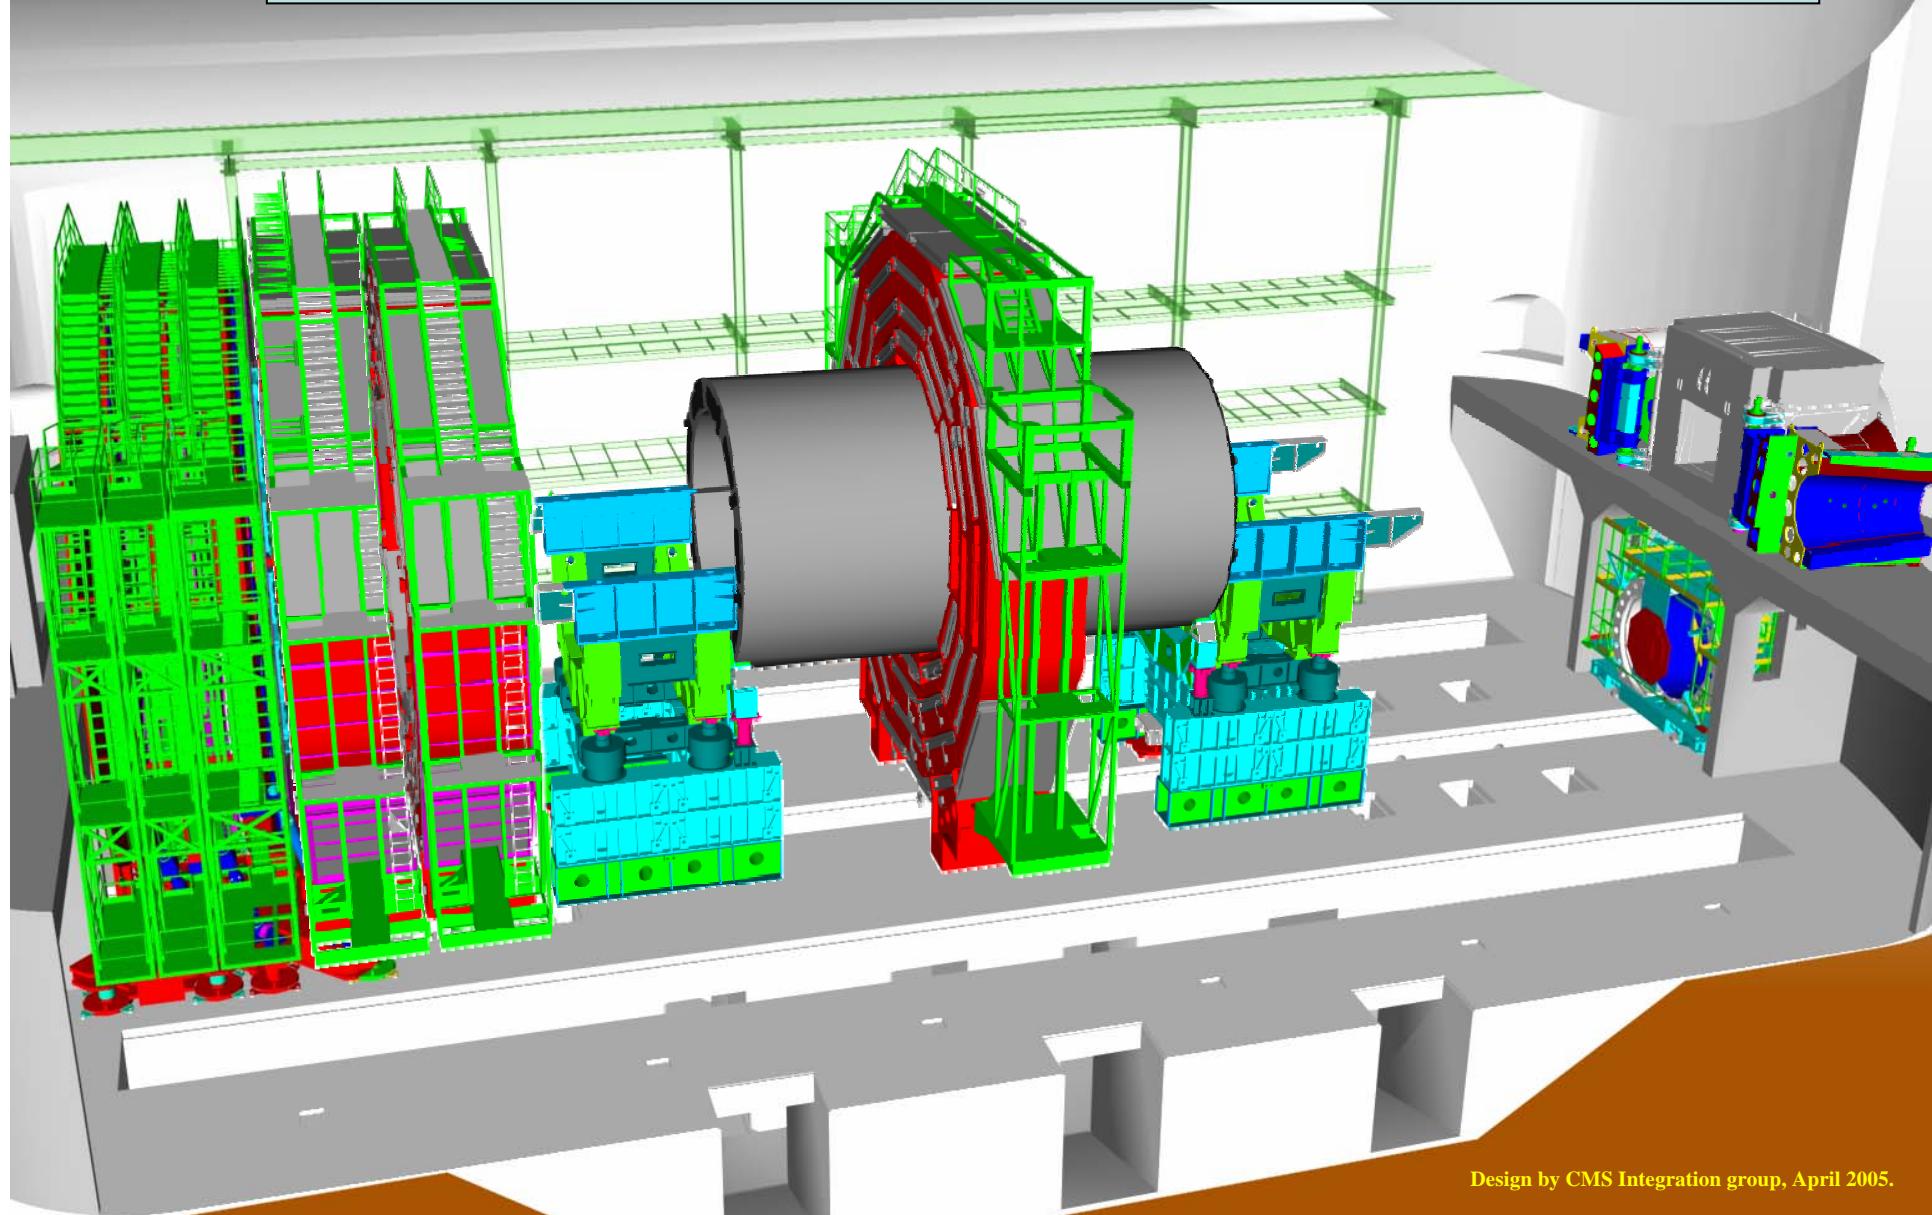

Design by CMS Integration group, April 2005.

Move HB- inside vacuum tank

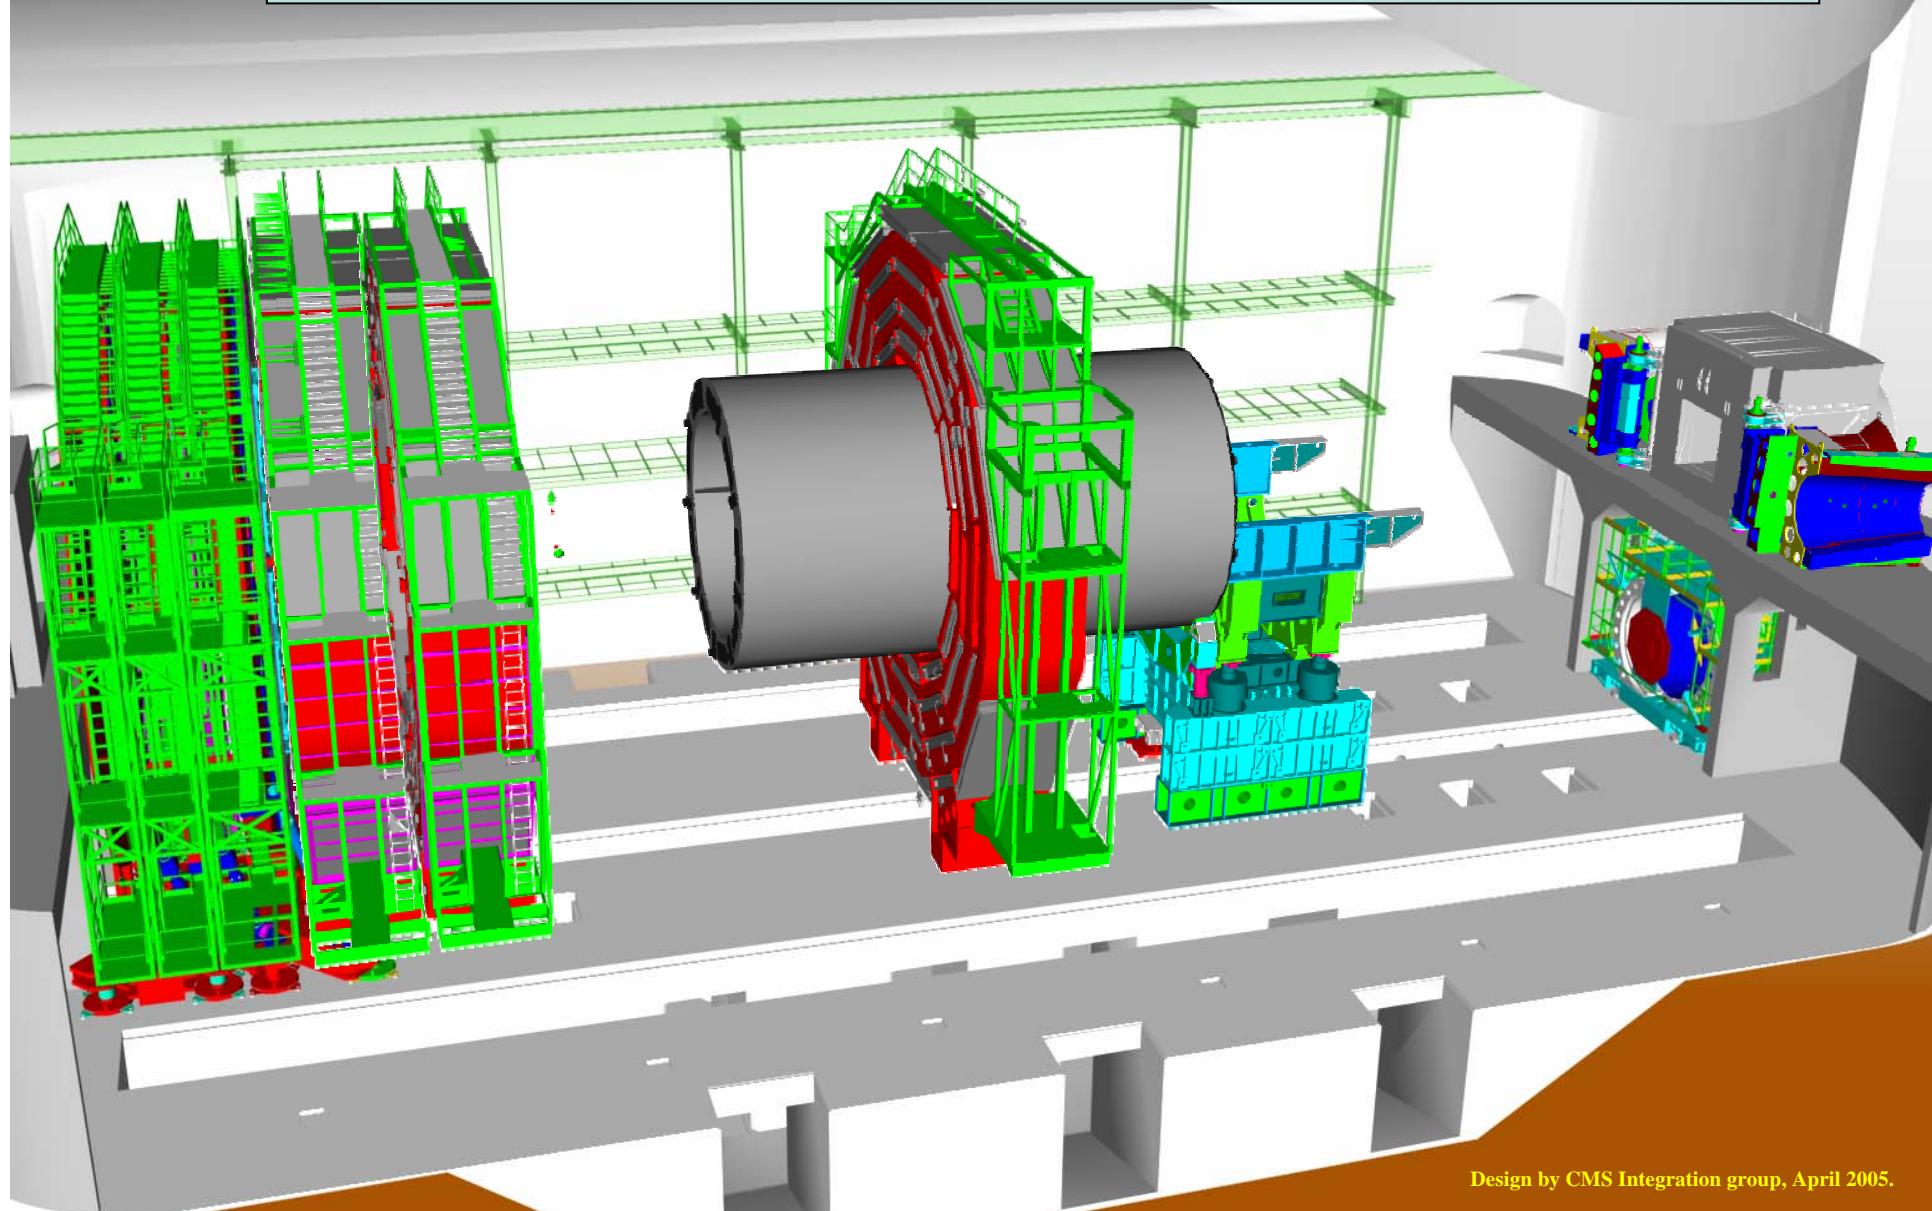

Design by CMS Integration group, April 2005.

Start HB cradle removal

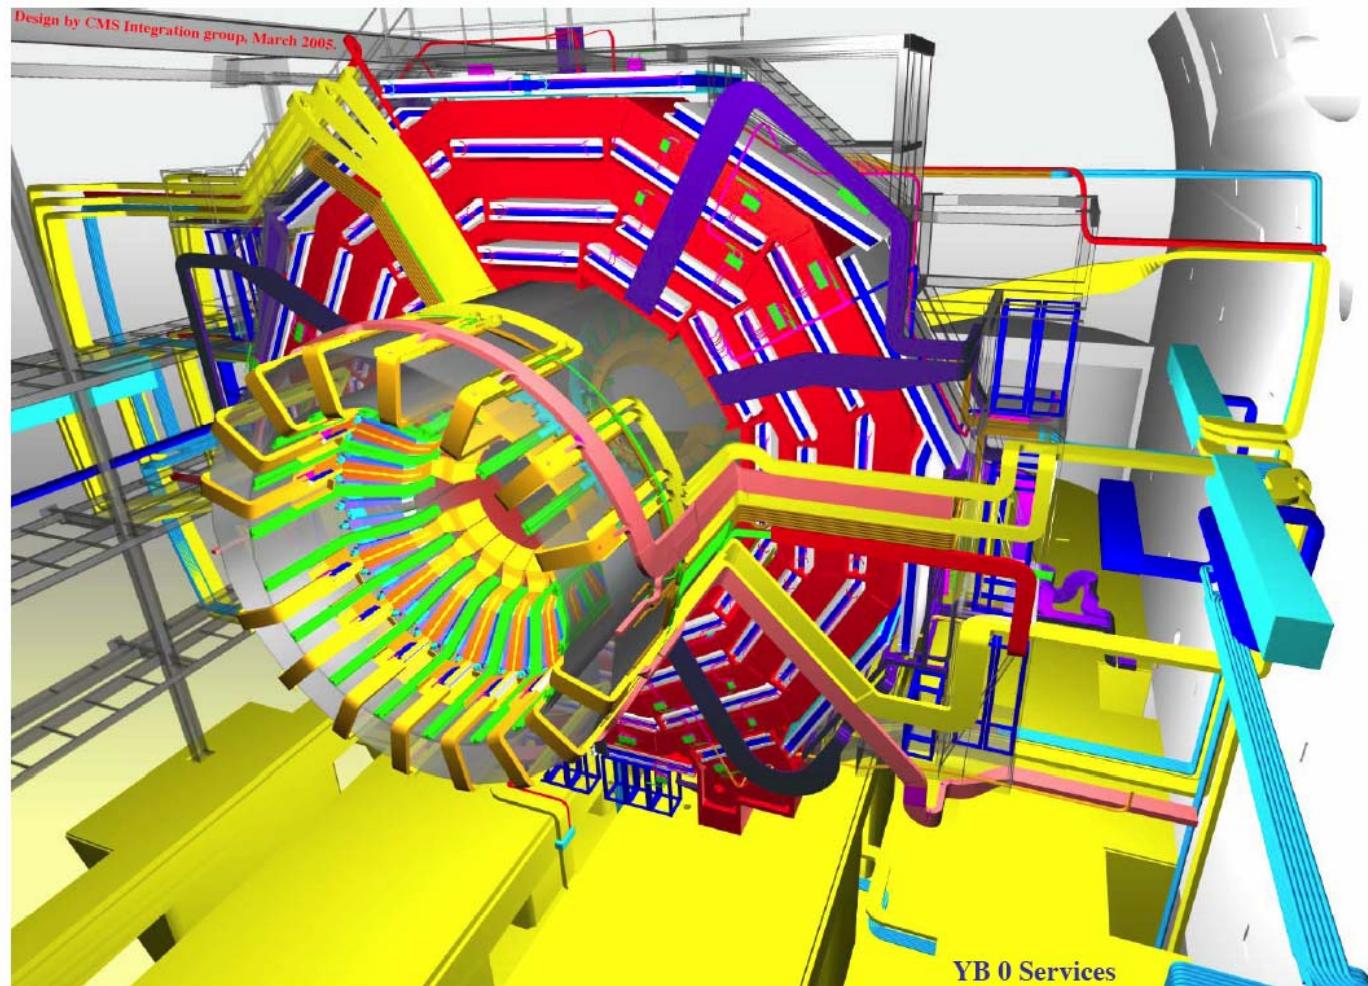

Design by CMS Integration group, April 2005.

Remove HB+ cradle

Design by CMS Integration group, April 2005.

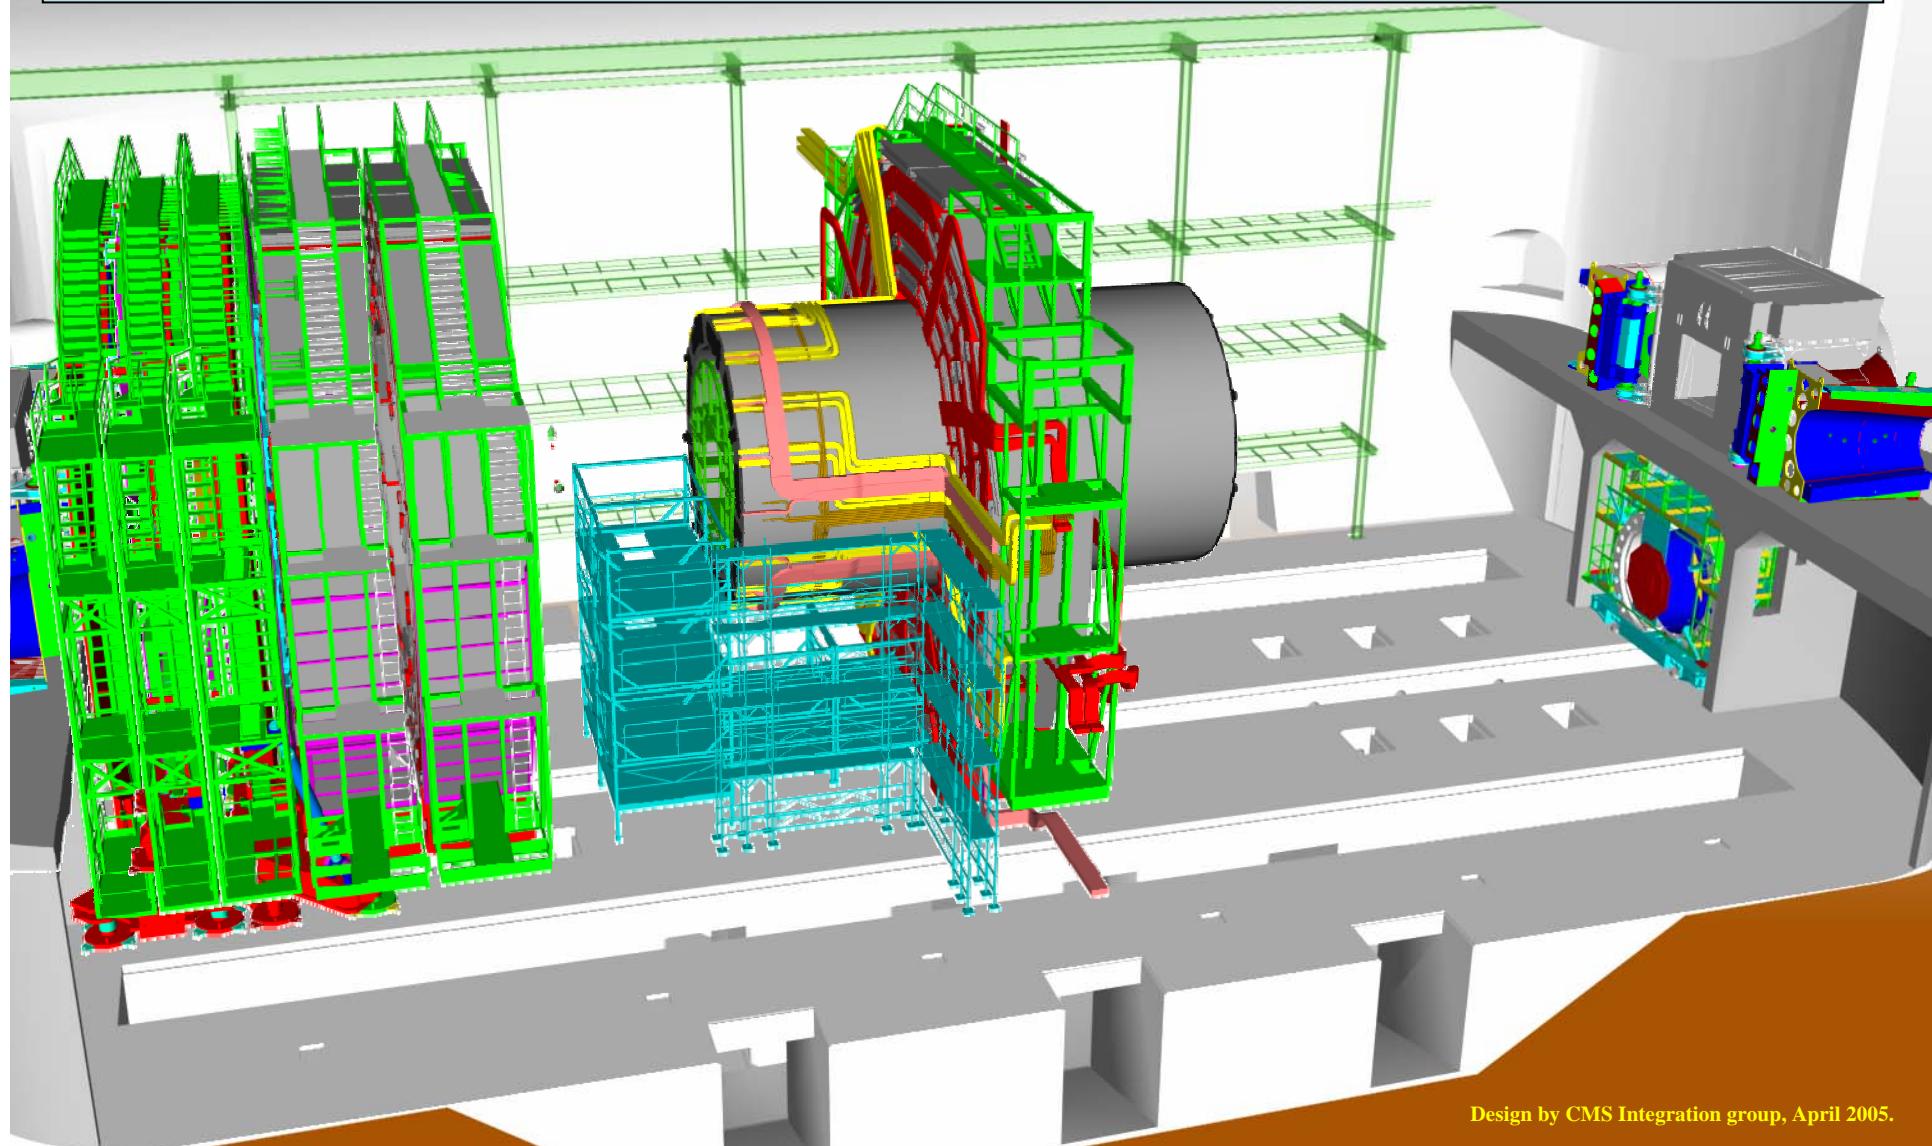

Installation of YB0 services

3D model of the YB0 services to be installed

46

During installation of cables on YB0,
minus side wheels and disks can be completed on the surface

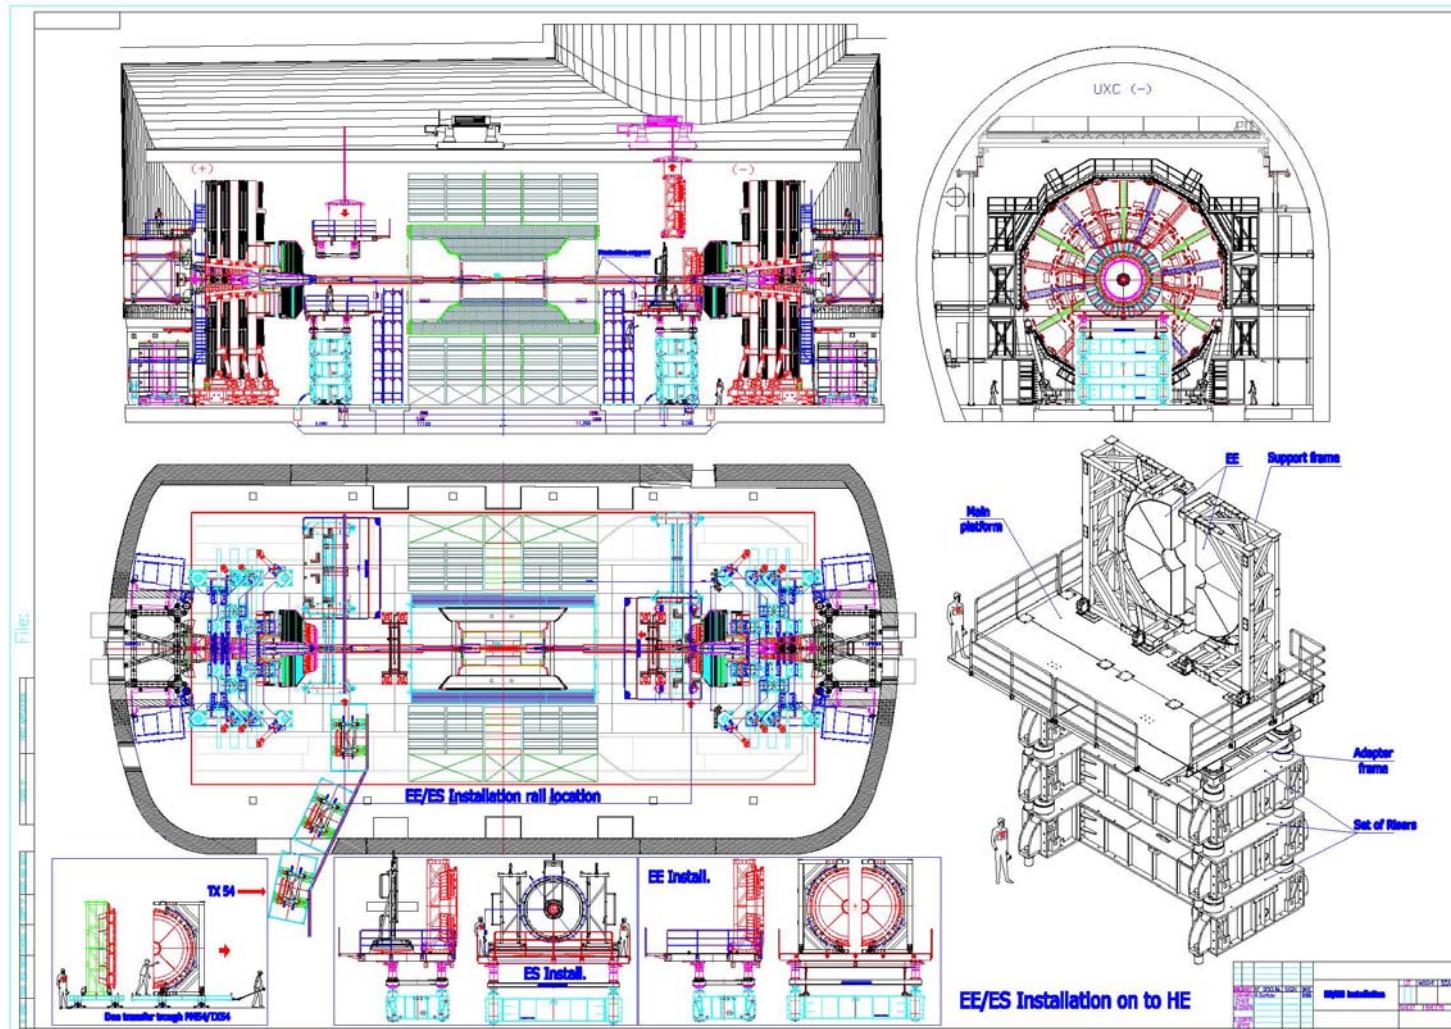

Design by CMS Integration group, April 2005.

Situation Underground during Shut-downs

Installation of EE during the first Shut-down

Typical 2D installation assembly drawing

Ecal End-cap installation inside UXC55.

ILC Engineering Forum 13 October 2006

Provisional Conclusions

50

Conclusions

- We have been able to maintain the principles adopted in 1991/1992 without any compromising do date.
- The scenario of constructing on the surface followed by transfer underground looks still to us the best solution for a detector like CMS.
- However, principles and logistics definitions are not sufficient for a successful project, many other actors are needed in particular the implementation, very early in the game, of a powerful “Integration Project”.

The “BIG CMS puzzle” to solve

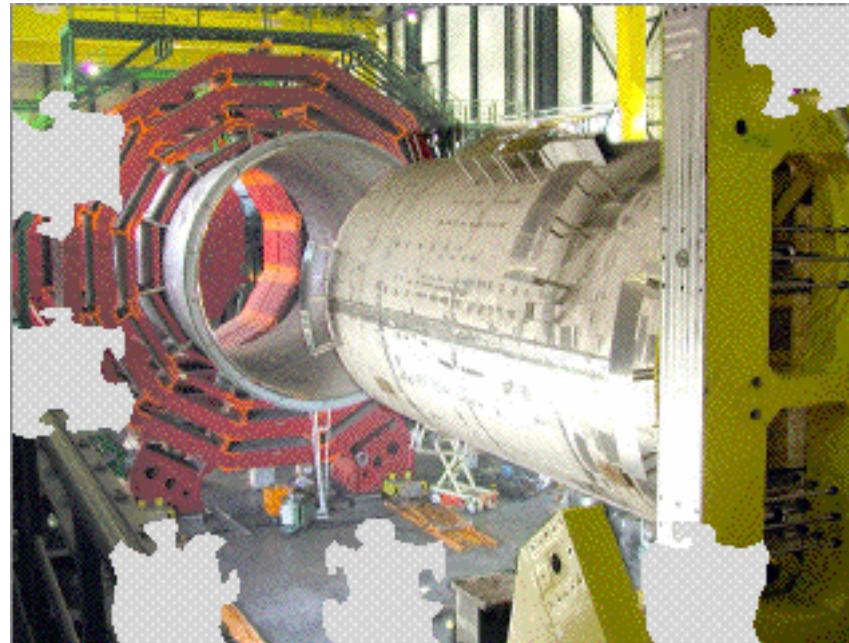

CMS Engineering & Integration

Safety & Quality Management

Sub-detectors
Parameters,
Envelopes
Installation
Configuration Management
Engineering data Management

Cables, Services
Gas & Cooling

Civil Engineering
Infrastructure

Beam pipe &
Vacuum systems

to be continued...
