## Calculability

# Walking gauge coupling

- Walking technicolor requires a non-Abelian gauge theory exhibiting nearly-conformal behavior over a certain finite energy range.
- At high energy, the gauge coupling constant exhibits asymptotic freedom.
- As the distance scale increases the coupling enters an approximate scale invariance region of strong coupling where it slows down ("walking" region).
- At still larger distances the gauge coupling begins to grow rapidly until it enters the confinement region where there is no longer any vestige of the scale symmetry.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

# Supergravity background

- Gauge-gravity duality provides an alternative means to calculate the running in non-perturbative regions of coupling constant space.
- Nunez, Papadimitriou and Piai <sup>2</sup> constructed a Type IIB supergravity background dual to a strongly coupled  $\mathcal{N} = 1$  SUSY gauge theory which exhibits the above described running behavior.
- The background is obtained by considering a supergravity limit of a stack of  $N_C$  D5 branes wrapping a 2-cycle resulting in a specific ten-dimensional space-time.
- The invariant interval is further characterized by the integration constant parameters C and T.

# Walking gauge coupling

 $N_{C} = 10$ 

- blue: C = 50,  $T = 10^{-10}$ red: C = 100,  $T = 10^{-12}$
- The running t'Hooft gauge coupling constant  $g^2 N_C / 8\pi^2$ shows walking behavior. The logarithm of the renormalization scale is related to the distance  $\rho$  into the bulk.
- The smaller the value of *C*, the stronger the gauge coupling in the walking region.
- The smaller the value of *T*, the greater the length of the walking region.

## chiral symmetry breaking

- Anguelova, et al.<sup>3</sup> added techni-flavors to the model by embedding  $N_F$  stacks of D7 and  $\overline{D7}$  branes in a U-shaped geometry necessary for  $U(N_F) \times U(N_F) \rightarrow U(N_F)$  symmetry breakdown.
- They employed holographic techniques in order to study the vector and axial vector meson contributions to the electroweak precision parameters.
- The purpose of our work is to determine the stability of such a  $D7-\overline{D7}$  techni-brane embedding.
- A D7 probe brane profile is obtained by solving the field equations obtained from the Dirac-Born-Infeld (DBI) action of the D7 brane with induced metric  $g_{(8)}$ .

<sup>&</sup>lt;sup>3</sup>Nucl. Phys. **B852**, 39-60 (2011)

- The D7 branes were chosen to have complementary coordinates as functions of the  $\rho$  coordinate only,  $\theta = \theta(\rho)$  and  $\varphi = \varphi(\rho)$ .
- The location  $\rho_0$  of the tip of the branes is an integration constant.

	x <sup>0</sup>	$x^1$	<i>x</i> <sup>2</sup>	<i>x</i> <sup>3</sup>	θ	$\varphi$	ρ	$\tilde{ heta}$	$\tilde{\varphi}$	$\psi$
	0	1	2	3	4	5	6	7	8	9
D5	Х	х	Х	х	х	х				
D7- <u>D7</u>	Х	х	Х	х			x	х	х	х

▲□▶ ▲□▶ ▲豆▶ ▲豆▶ = 三 - のへで

#### brane stability

- In order to determine the stability of this probe brane embedding, small oscillations about the D7 brane profile are considered in the  $(x^{\mu}, \rho)$  directions:  $\theta(x, \rho) = \pi/2 + \Delta \theta(x, \rho)$ ,  $\varphi(x, \rho) = \varphi(\rho) + \Delta \varphi(x, \rho)$ .
- Expanding the DBI action for the D7 brane to quadratic order in the fluctuations  $\Delta \theta$  and  $\Delta \varphi$  yields the fluctuation Lagrangian.
- Separating the  $x^{\mu}$  and  $\rho$  variables gives the equations  $\partial^2 \Delta \varphi = M_{\varphi}^2 \Delta \varphi$  and similarly for  $\Delta \theta$  for the 4-dimensional behavior.
- The D7 and  $\overline{D7}$  branes stack separately on each side of the U-shaped embedding profile. In order to distinguish these separate locations a transformation of coordinates from  $\rho$  to  $\zeta$  is introduced with the location of the D7 branes along  $\zeta > 0$  branch while the  $\overline{D7}$  branes are along the  $\zeta < 0$  branch.

- The fluctuation spectrum values of  $M^2$  for the techni-scalar and techni-pseudoscalar meson modes must in general be determined numerically for various values of  $\rho_0$ , C and T.
- Insight into the spectrum can be obtained by considering values of ρ in the walking region where the metric simplifies.
- The Schrödinger equations for the fluctuations in this case become

$$\begin{aligned} -\phi_{\varphi}''(\zeta) + V_{\varphi}(\zeta)\phi_{\varphi}(\zeta) &= E_{\varphi}\phi_{\varphi}(\zeta) \\ -\phi_{\theta}''(\zeta) + V_{\theta}(\zeta)\phi_{\theta}(\zeta) &= E_{\theta}\phi_{\theta}(\zeta). \end{aligned}$$

The meson masses are related to the energy eigenvalues as

$$E_{\varphi} = CTM_{\varphi}^2 e^{4
ho_0} \qquad,\qquad E_{ heta} = CTM_{ heta}^2 e^{4
ho_0}.$$

$$\begin{split} V_{\varphi}(\zeta) &= -\frac{1}{4} \frac{(\zeta^2 + 6)}{(\zeta^2 + 1)^2} - \frac{\lambda_{\varphi}}{(\zeta^2 + 1)} & V_{\theta}(\zeta) &= -\frac{1}{4} \frac{(\zeta^2 - 2)}{(\zeta^2 + 1)^2} - \frac{\lambda_{\theta}}{(\zeta^2 + 1)} \\ \lambda_{\varphi} &= 0 & \lambda_{\theta} &= Te^{4\rho_0} \\ W_{\varphi}(\zeta) &= \frac{1}{\zeta} - \frac{1}{2} \frac{\zeta}{1 + \zeta^2} & W_{\theta}(\zeta) &= \frac{1}{2} \frac{\zeta}{1 + \zeta^2} \end{split}$$

- The spectra can be understood in terms of approximate supersymmetry and conformal symmetry.
- Since the superpotential W<sub>φ</sub>(ζ) is singular, supersymmetry does not preclude the existence of negative energy states.
- Both models can be regarded as conformal quantum mechanics with regulated singularity.
- The second term in each potential breaks supersymmetry.
- The parameter  $\lambda_{\theta}$  is very small for values of the parameter T that yield a substantial range of walking behavior.

・ロト ・ 同 ト ・ ヨ ト ・ ヨ ・ うへの

• For large  $\zeta$  the potentials asymptote to  $-\frac{1/4+\lambda}{\zeta^2}$ .

#### $\Delta \theta$ fluctuation spectrum

- Ground state (*n* = 1): solid blue curve
- First excited state (*n* = 2): dashed red curve
- There is an infinite number of negative energy states.

- Rescaled energy  $\tilde{E}_n \equiv E_n/e^{-\frac{n\pi}{\sqrt{\lambda}}}$
- Energy spectrum approaches  $E_n = -C_1 e^{-\frac{n\pi}{\sqrt{\lambda}}}$  for small  $\lambda$ .

イロト 不得 トイヨト イヨト

-

• Numerically determined:  $C_1 = 5.02$ 

## $\Delta \theta$ fluctuation spectrum: with cut-off

- large distance cut-off further breaks conformal invariance
- dashed red curve: ground state eigenfunction (n=1)
- cut-off:  $\zeta_{\Lambda} = 10$
- λ = 0.1

- purple dotted curve: ground state energy value in the absence of a cut-off
- red dashed curve: ground state energy of an infinite square well

## $\Delta \phi$ fluctuation spectrum

- Ground state (*n* = 0): solid blue curve
- First excited state (*n* = 1): dashed red curve
- Second excited state (n = 2): dotted black curve
- Infinite number of bound states for  $\lambda > 0$

- one deep lying bound state (n=0) remains even at  $\lambda = 0$ :  $E_0 = -0.56$
- Energy spectrum approaches  $E_n = -C_2 e^{-\frac{n\pi}{\sqrt{\lambda}}}$  for small  $\lambda$  and n > 0.

• Numerically determined:  $C_2 = 0.67$ 

#### $\Delta \phi$ fluctuation spectrum: with cut-off

- dashed red curve: ground state eigenfunction (n=0)
- cut-off:  $\zeta_{\Lambda} = 10$
- cut-off does not affect the ground state energy unless it is as low as the width of the ground state wave-function in the absence of a cut-off.

- λ = 0.0
- purple dotted curve: ground state energy value in the absence of a cut-off
- red dashed curve: ground state energy of an infinite square well

# Summary

- The gravity dual to a  $\mathcal{N}=1$  SUSY gauge theory which exhibits an approximately conformal ("walking") region while strongly interacting was considered.
- Stacks of D7-D7 techni-branes corresponding to the addition of techni-fermions in the gauge theory were embedded in the 10 dimensional space-time.
- Fluctuations of the embedded branes into complementary  $\varphi$  and  $\theta$  space were considered.
- The equations of motion took the form of one-dimensional Schrödinger equations with factorizable Hamiltonians.

- The scalar and pseudoscalar meson mass squared spectrum was obtained by numerically analyzing the Schrödinger equations.
- Both of the  $\Delta \varphi$  and  $\Delta \theta$  pseudoscalar meson fluctuations and the  $\Delta \theta$  scalar meson fluctuations were found to be stable.
- However, the Δφ scalar meson fluctuation was found to be unstable having a negative mass squared value even for low values of the cut-off.
- Whether a more general embedding of the stacks of D7-D7 branes involving the 2-cycle Σ<sub>2</sub> used to wrap the stacked D5 branes of the gauge theory made from the twisting of the S<sup>2</sup> coordinates θ, φ and the S<sup>3</sup> coordinates θ̃, φ̃ and ψ will lead to a stable techni-brane embedding remains to be investigated.
