

DAQ for the AIDA telescope

EUDAQ, general architecture

EUDAQ, AIDA-telescope requirements

- With low size events it's not possible to use full Ethernet bandwidth – need to send a couple events per one bunch
- A trigger time stamp is needed for data reconstruction with high resolution for each trigger
- EUDAQ needs to be modified to receive different numbers of events from each producer
- Data should be written in separate file (each producer has own data file)
- Time-stamp read-out from TLU should be done as quickly as possible
