

Charm mixing and CPV in LHCb

Tuesday, 12 June 2012 09:25 (25 minutes)

LHCb has collected the world's largest sample of charmed hadrons. The $\sim 1 \text{ fb}^{-1}$ sample collected in 2011 is used to search for direct and indirect CP violation in charm, and to measure D^0 mixing parameters. Preliminary measurements from several decay modes are presented, with complementary time-dependent and time-integrated analyses. Together, these results significantly improve upon existing measurements.
