

Lepton Flavor violation processes in 331 models

Thursday, 14 June 2012 17:20 (40 minutes)

Six lepton flavor violation processes are calculated in the framework of a model based on the gauge symmetry $SU(3) \times SU(3) \times U(1)$ (331) without exotic charges in its fermionic spectra. Parameters involved are constraint using the experimental bounds coming from BABAR. Possible implications in the neutrino sector are discussed.
