

Lepton Universality Tests in Kaon Decays at NA62

Wednesday, 13 June 2012 09:30 (30 minutes)

A precision measurement of the helicity-suppressed ratio R_K of the $K^{+-} \rightarrow e^{+-} \nu$ and $K^{+-} \rightarrow \mu^{+-} \nu$ decay rates has been performed using the full data set collected by the NA62 experiment in 2007–2008. The result is in agreement with the Standard Model expectation, and constrains two-Higgs-doublets extension of the Standard Model.

Summary

A precision measurement of the helicity-suppressed ratio R_K of the $K^{+-} \rightarrow e^{+-} \nu$ and $K^{+-} \rightarrow \mu^{+-} \nu$ decay rates has been performed using the full data set collected by the NA62 experiment in 2007–2008. The result is in agreement with the Standard Model expectation, and constrains two-Higgs-doublets extension of the Standard Model.
