I. Breaching Unitarity Bounds

Celebration: 5 fb^{-1} @ LHC 7 TeV in 2011 !

Apprehension: No-New-Physics !!

Unfortunately, no hint of New Physics in the LHC data (yet)

1-2-3 of 2011

	Lower Limit (95% C.L.)
SUSY ($m_{\tilde{q}} = m_{\tilde{g}}$)	1 TeV
Gauge bosons (SSM)	2 TeV
Excited quark	3 TeV

Michael Peskin at LP11

Our field seems to be approaching a definite point of reckoning. But will it lead us to *enlightenment*, or to disillusionment and chaos ?

*Confutatis maledictis,
flammis acribus addictis,
voca me cum benedictus.*

*When the accursed are confounded,
and doomed to flames of woe,
Call me among the Blessed.*

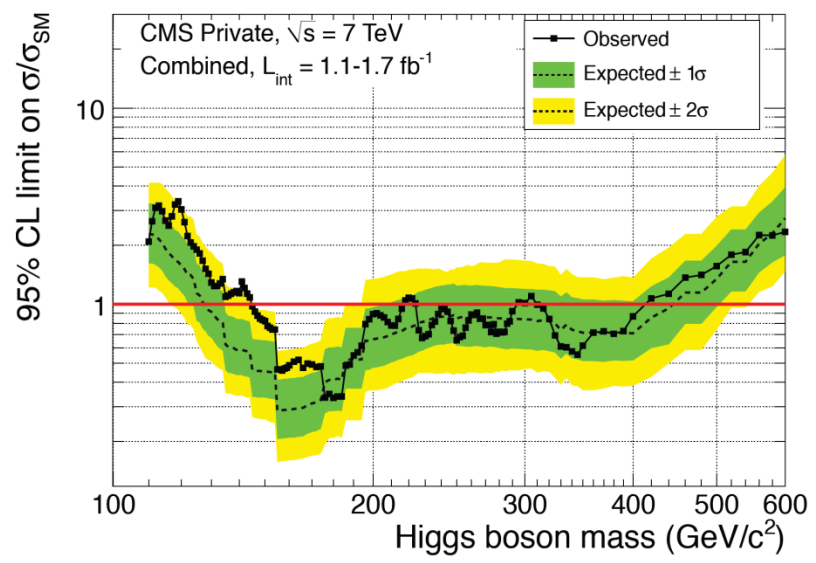

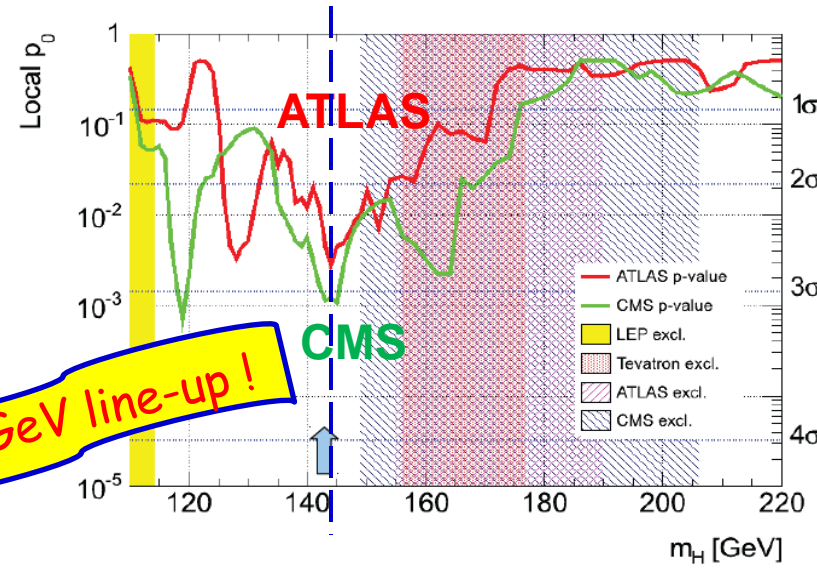

Higgs Saga: July => August

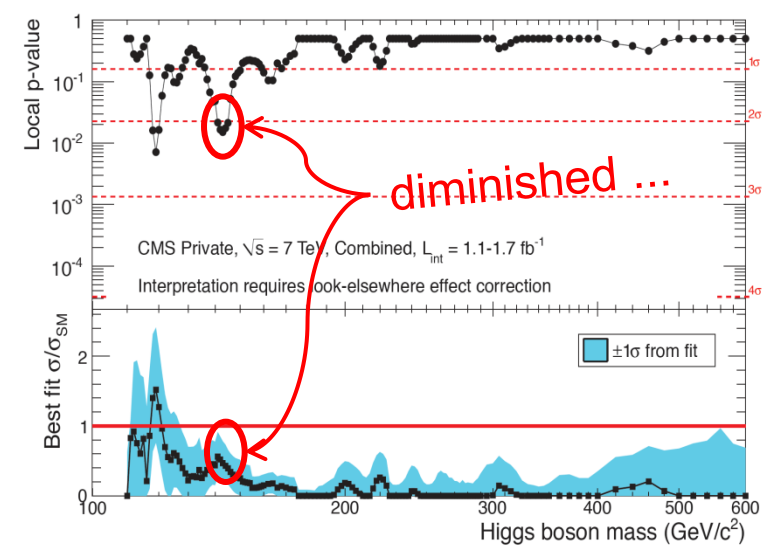

EPS

144 GeV line-up!

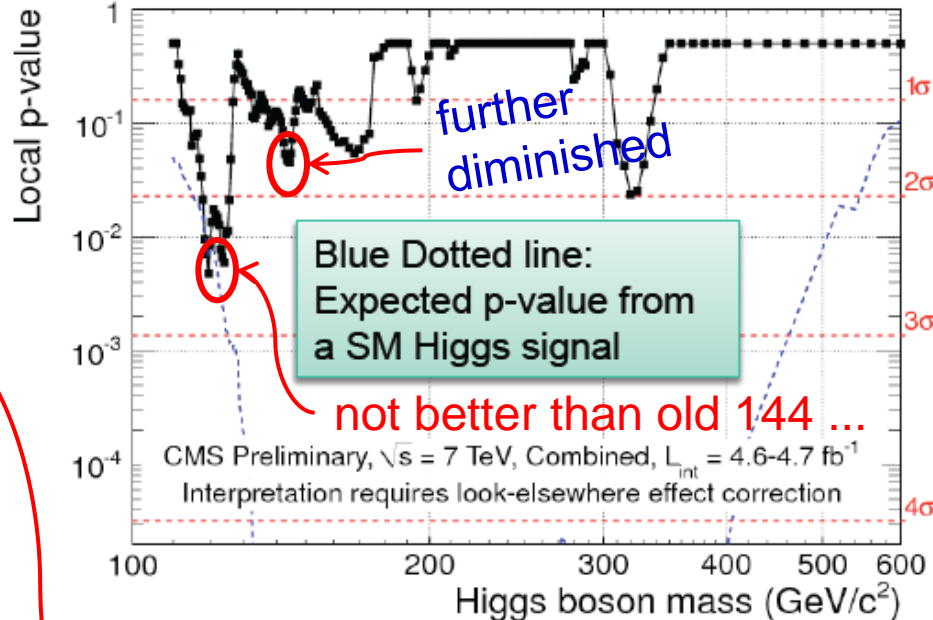

LP

Higgs Saga: December 13, 2011

We do not have any firm experimental knowledge that the Higgs boson even exists.

Will 125 GeV survive ?

$$m_{t'} \cong m_{b'} \equiv m_Q \gtrsim 500 \text{ GeV}$$

CMS '11 prelim.

Correlated?

strong $W_L W_L$ scattering

strong $Q\bar{Q}$ scattering

Theme: Can *Strong Yukawa Coupling* generate EWSB itself ?

II. From Gauge to Yukawa Couplings

Experimental Facts:

- q & ℓ pointlike to 10^{-18} m

Governed by $SU(3)_C \otimes SU(2)_L \otimes U(1)_Y$

- $M_W = \frac{1}{2}gv \implies$ SSB
- All fermions Massive \implies EWSB as well

Elementary Higgs Not yet a Fact

Theoretical Foundation: Renormalizability of Gauge Theories

Proof based on Ward Identities, unaffected by SSB.
't Hooft. 1972

Existence of Yukawa Couplings an Experimental Fact !

Unitary Gauge (no scalar particles)

Higgs Not Mentioned!

Eq. of Motion (known massive)

$$\begin{aligned} \frac{g}{\sqrt{2}} \frac{k}{M_W} L &= \frac{g}{\sqrt{2}} \frac{p_i - p_j}{M_W} L = \frac{g}{\sqrt{2}} \frac{m_i L - m_j R}{M_W} \\ &= \sqrt{2} \left(\frac{m_i}{v} L - \frac{m_j}{v} R \right) \\ &\equiv \lambda_i L - \lambda_j R, \end{aligned}$$

$$\lambda_Q \equiv \frac{\sqrt{2} m_Q}{v}$$

Yukawa Coupling from Purely Left-handed Gauge: **Goldstone Coupling**

W_L

N.B. KM and Flavor/CPV Provide further evidence for Yukawa Dynamics, yet again No Higgs

III. Yukawa Bound States: A Postulate

Could there be more chiral generations ? — Already 3 !

Abstract

This summary of the Workshop "Beyond the 3-generation SM in the LHC era" presents a brief discussion of the following four statements about the fourth generation: 1) It is not excluded by EW precision data; 2) It addresses some of the currently open questions; 3) It can accommodate emerging possible hints of new physics; 4) LHC has the potential to discover or fully exclude it.

PACS codes: 12.60.-i; 14.60. Hi; 14.80.-j

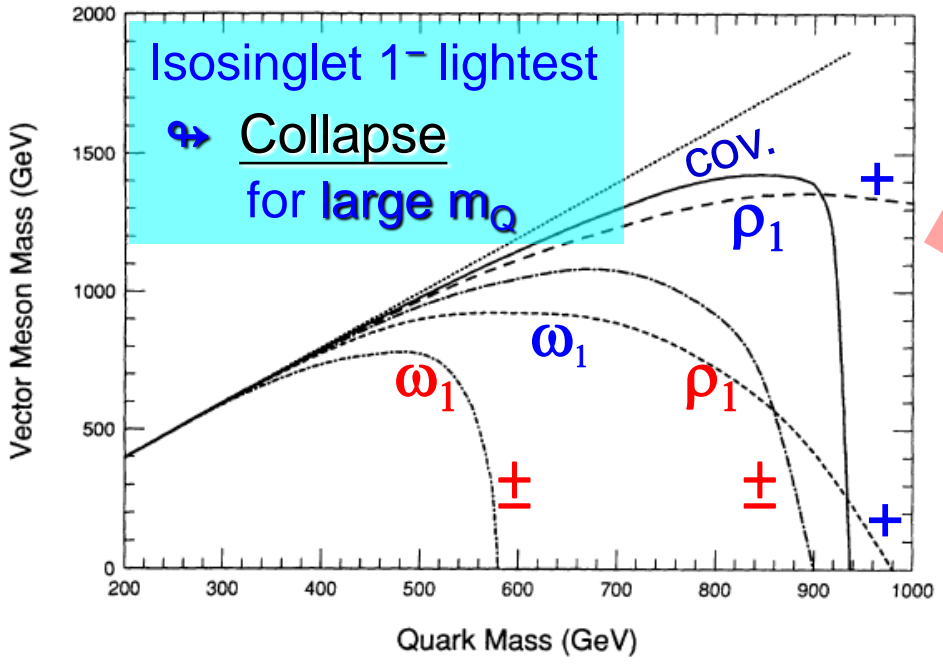

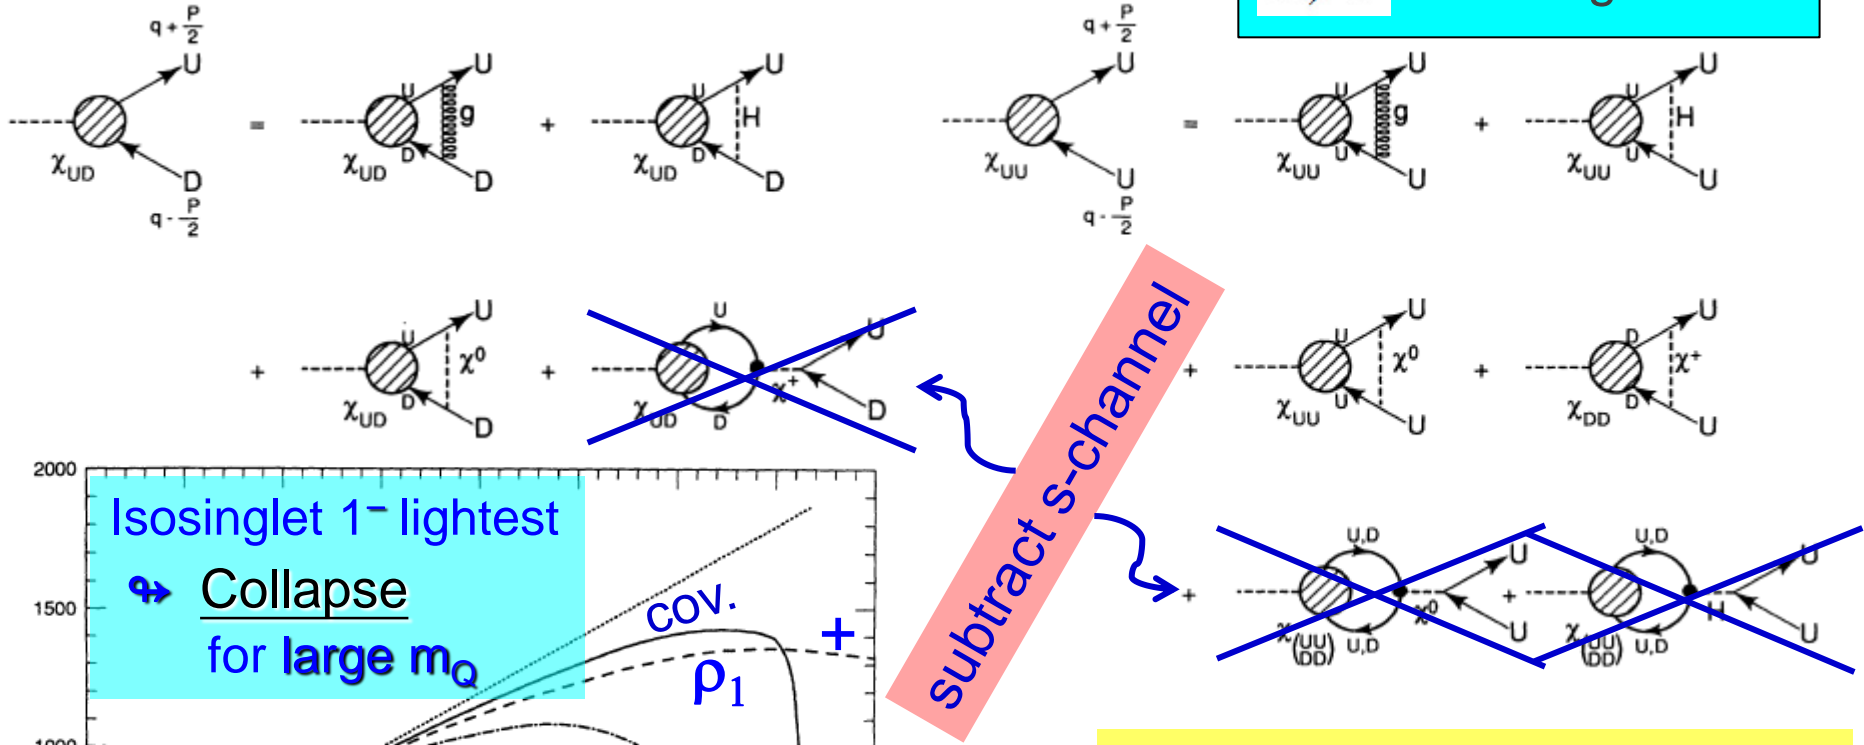

Bethe-Salpeter approach to new Heavy Isospin

b', t' semi-degenerate

Jain et al., PRD 92; 94

π_1 becomes most attractive!

but s-channel is repulsive !

Ishiwata & Wise, PRD 11
relativistic correction study

breaks down ?

Fourth Generation Bound States

relativistic expansion study

(i) a_0/a_{QCD} (color singlet)

breaks down ?

My interpretation:

- QCD-bound for GeV scale binding energy
- Sudden turn-on of Large Yukawa Coupling
 \Rightarrow Sudden drop in radius, jump in binding
- Rel. Expan. fails just when it turns interesting.

(ii) Binding Energy (color singlet)

Binding Energy (color octet)

accidental degeneracy.

(C, I, S)		Lower limit of $m_{q'}$
$(8, 0, 0)$		No bound state
$(8, 0, 1)$	ω_8	534 GeV
$(8, 1, 0)$	π_8	534 GeV
$(8, 1, 1)$	ρ_8	696 GeV

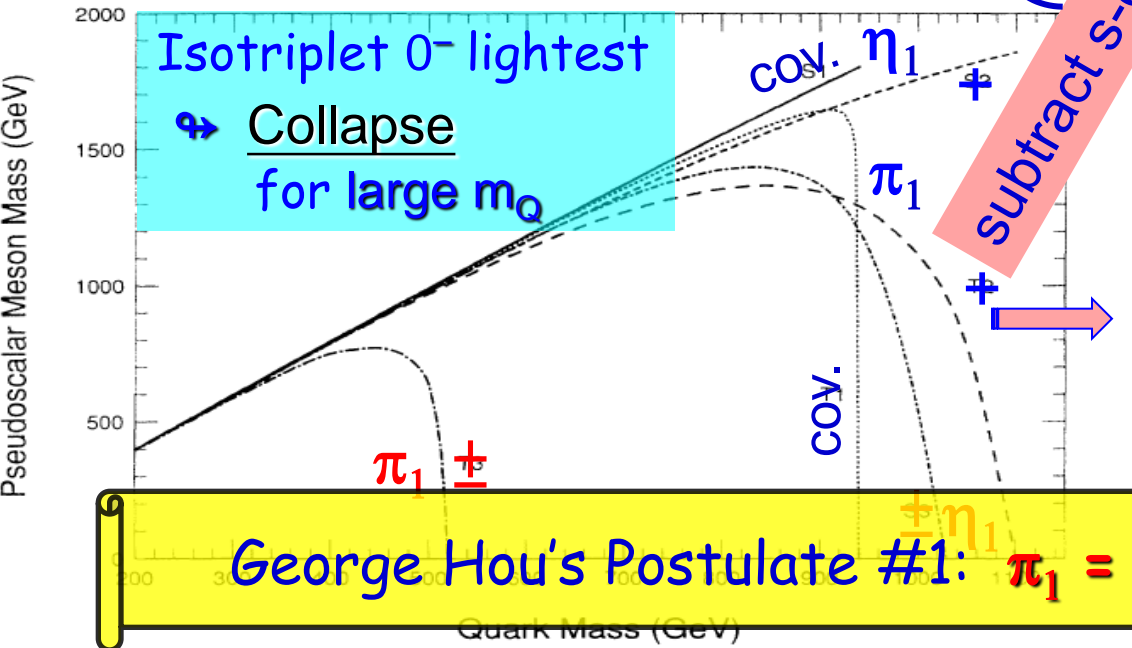

less bound

Bethe-Salpeter approach to new Heavy Isospin

b', t' semi-degenerate

Jain et al., PRD 92; 94

subtract s-channel

π_1 becomes MAC !

but s-channel is repulsive !

Goldstone as Collapsed $\bar{Q}Q$

IV. Gap Equation without Higgs

Disc. w/ Enkhbat and Yokoya, 1/2011

Self Energy !

Can one form Gap Eq.?

Tight and Tiny

“Empirical”

- Got Mimura interested (since 4/2011)
- Asked Kohyama to check vs NJL (since 1/2011)
- Literature:
 - Maskawa et al. '70s
 - Higashijima '84
 - Fukuda & Kugo '76
- Bingo: finally read Hung & Xiong '11, recently
 - Almost same Eq., with G replaced by massless H-doublet
 - Follow Fukuda-Kugo/Leung-Love-Bardeen “Strongly-coupled Scale-Inv. QED”
==> Dynamical Chiral Symmetry Breaking
 - Idiosyncrasy on UV fixed-point
- Integral Eq. ==> DEq. + B.C.

$$G = \pi_1$$

up to almost $2m_Q$

ad hoc

Numerical Guess:

$$\lambda_Q \sim \sqrt{2}\pi$$

Goldstone

critical $m_Q \sim 800 \text{ GeV}$

Collapsed QQ

Will study with Mimura and Kohyama (maybe Kohda?)

V. Discussion and Conclusion

- We adhered to Empirical/Heuristic Approach
- Yukawa-bound “mesons” might collapse
==> Postulate that Goldstone is MAC
- Simple Gap Eq. \sim Strong Scale-inv. QED
 - vs. NJL: No 4Q-operator assumed
Instead, tightly bound Goldstone
 - vs. QCD/TC: Q is Not Confined!
Pion of QCD a Stringy state;
here, yet unknown — Theory of Yukawa —
- Experimental View:
From 3-2-1/No-New-Physics, no objects @ v.e.v.
 - Gap Eq. seem to sum up all dominant effect
 - $V_L = G$ may be the only “portal” to New Physics,
other than direct production of heavy Q pair.

$$\pi_1 = G$$

Look mom, ~~no hands!~~
Higgs

Origin of EWSB: $\bar{Q}Q$ condensation
 ==> Strongly Coupled Higgs Sector
 \oplus spectrum of heavy $\bar{Q}Q$ states

In essence, we suggest a “bootstrap” picture where both the Goldstone boson, and the heavy quark mass, are generated by a strongly coupled gap equation.
