Database access management system

Monday, 23 April 2012 14:50 (20 minutes)

This talk will present the access management system used at CERN Database Services group for allowing intercommunication within the nodes of the various database clusters, used also for granting and maintaining access to database and application servers to administrators and users. Started as a simple SSH keys management tool, the system has evolved together with CERN IT infrastructure, providing now integration with Kerberos, authorization via LDAP groups and so on.
