[Current tests](#page-10-0)

[Future work](#page-15-0)

<span id="page-10-0"></span>**[Figures](#page-17-0)** 

### Prototype instrument:

- Requires vacuum for particle propagation
- Perfect Binary Array mask of tungsten-copper pseudo-alloy (470  $\mu$ m)
- Back-illuminated CCD64 from e2v (nitrogen cooling)

### Test setup:

- $\circ$  Radioactive  $\beta$  sources: Samarium-151, Carbon-14
- X-Y table for control of source position

**[Figures](#page-17-0)** 

### Prototype analysis currently acquiring data

- Preliminary results visually match simulations
- Need longer times to match trapped particle fluxes Differences between space and lab analysis
	- Mask pattern needs to be scaled
	- Lab electronics allow 100 s integration times
	- Noise levels require individual particle identification and summing

### Future work

## $\blacksquare$ UCI

### Arrow Lee

- [Space particle](#page-1-0)
- [Research aims](#page-4-0)
- 
- aperture
- 
- [Current tests](#page-10-0)
- [Future work](#page-15-0)
- <span id="page-15-0"></span>[Figures](#page-17-0)
- Use of the concept with other suitable detectors, for example Medipix
- Further simulations of designs in realistic space-like environments
- Use of other particle sources
