

PHYSICS AT THE AD/PS/SPS

LECTURE 3: FLAVOUR AND NEUTRINOS

Augusto Ceccucci/CERN

CERN Academic Lectures, June 21, 2012

Outline

⊙ Kaon Physics at the SPS (NA48, NA62)

- CP-Violation & Quark Mixing
- Lepton Universality
- Strong Interaction at Low Energy
- Rare Decays

⊙ Neutrino Physics at the SPS

- Long baseline neutrino experiments
 - CNGS1 OPERA
 - CNGS2 ICARUS

CP-VIOLATION AND QUARK MIXING

Baryon Asymmetry of the Universe (BAU)

$$n_{\text{quark}} - n_{\text{antiquark}} / n_{\text{quark}} \text{ (Proto Universe)} \sim n_{\text{baryon}} / n_{\text{photon}} \text{ (Today)} \sim 5 \times 10^{-10}$$

Sakharov Conditions for BAU

Andrei Sakharov (1967)

To allow the development of an asymmetry between matter and anti-matter

- 1. Violation of Baryonic Number**
- 2. Thermodynamic Non-equilibrium**
- 3. Violation of C & CP**

Origin of BAU: Baryogenesis or Leptogenesis?

CP-Violation

P

C

CP

When the top-left and the bottom-right Pictures are not exactly the same, we have CP-Violation

Da Gino Isidori:

<http://scienzapertutti.lnf.infn.it/P1/schedaCP.html>

Types of CP-Violation

$$\begin{aligned} |M_L\rangle &\propto p|M^0\rangle + q|\bar{M}^0\rangle \\ |M_H\rangle &\propto p|M^0\rangle - q|\bar{M}^0\rangle \end{aligned}$$

$$\Delta F = 2$$

$$\begin{aligned} A_f &= \langle f | H | M \rangle, \quad \bar{A}_f = \langle f | H | \bar{M} \rangle \\ A_{\bar{f}} &= \langle \bar{f} | H | M \rangle, \quad \bar{A}_{\bar{f}} = \langle \bar{f} | H | \bar{M} \rangle \end{aligned}$$

$$\Delta F = 1$$

1. CP Violation in mixing $|q/p| \neq 1$ (indirect)
2. CP Violation in decays $|\bar{A}_{\bar{f}}/A_f| \neq 1$ (direct)
3. CP Violation in the interference

$$\text{Im } \lambda_f \neq 0$$

$$\lambda_f \equiv \frac{q}{p} \frac{\bar{A}_f}{A_f}$$

The study of direct CP-violation in the two pion Decays of the neutral kaons (ϵ'/ϵ) was the main motivation to study kaon decays at the SPS

NA48/NA62 at CERN

NA48

1997: ε'/ε : $K_L + K_S$

1998: $K_L + K_S$

1999: $K_L + K_S$ | K_S HI

2000: K_L only | K_S HI

2001: $K_L + K_S$ | K_S HI

NA48/1

2002: K_S /hyperons

NA48/2

2003: K^+/K^-

2004: K^+/K^-

○ **Magnetic spectrometer (4 DCHs):**

- 4 views/DCH
- $\Delta p/p = 0.48\% + 0.009\% \cdot p$ [GeV/c]

○ **Liquid Krypton EM calorimeter (LKr)**

- High granularity, quasi-homogeneous;
- $\sigma_E/E = 3.2\%/E^{1/2} + 9\%/E + 0.42\%$ [GeV]
- $\sigma_x = \sigma_y = 0.42/E^{1/2} + 0.6\text{mm}$ (1.5mm@10GeV)

Old Detector **New**
Collaboration

2008: $K_{e2}^\pm/K_{\mu2}^\pm$ | tests

New Detector
(more on this later...)

NA62

2012 Technical Run

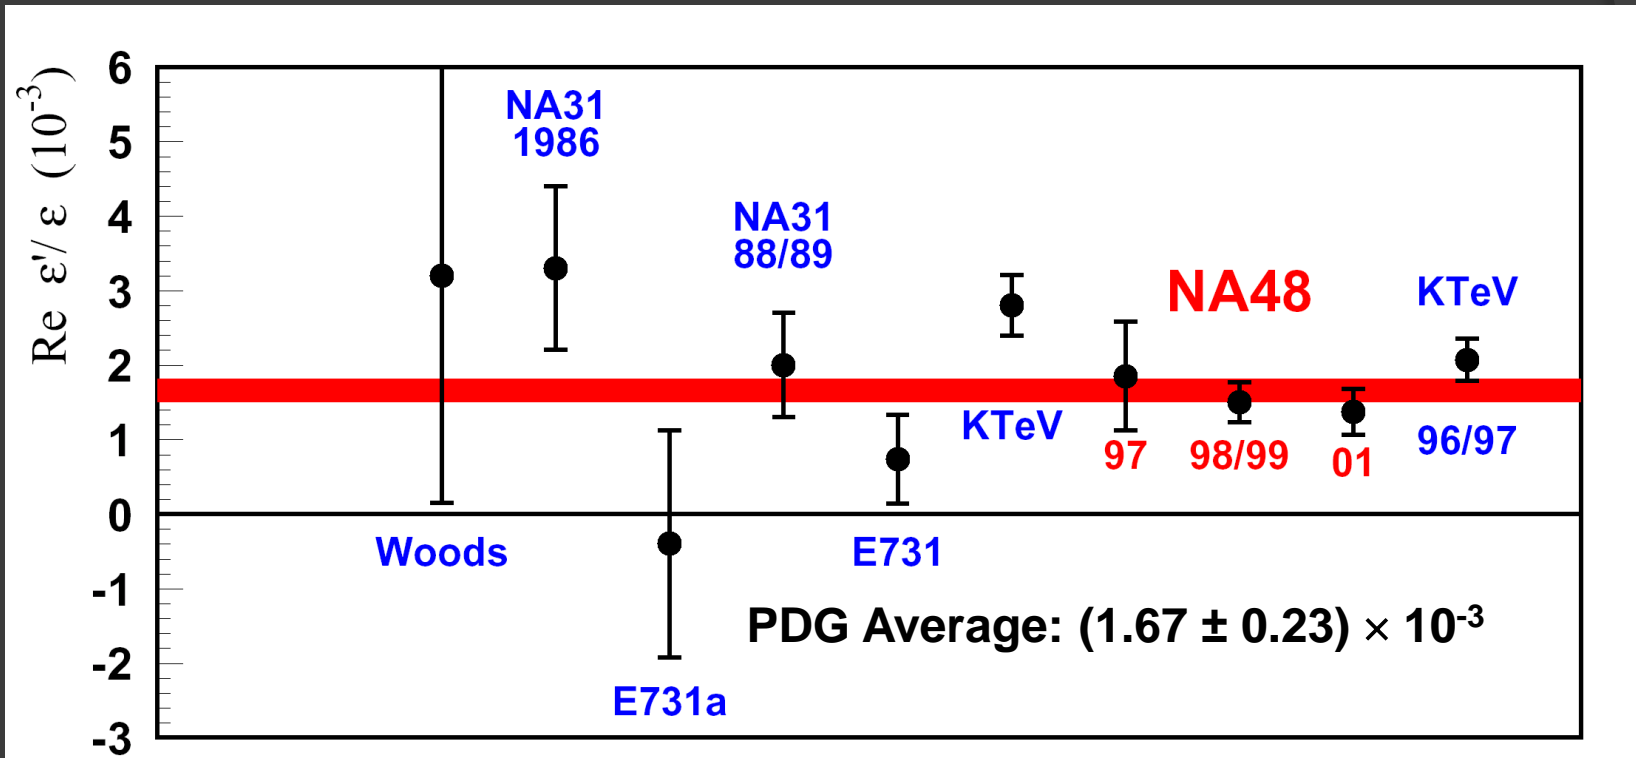

2014-
 $K^+ \rightarrow \pi^+ \nu \bar{\nu}$ Data Taking

Re ε'/ε measurements versus time

$$R = \frac{\Gamma(K_L \rightarrow \pi^0 \pi^0)}{\Gamma(K_S \rightarrow \pi^0 \pi^0)} / \frac{\Gamma(K_L \rightarrow \pi^+ \pi^-)}{\Gamma(K_S \rightarrow \pi^+ \pi^-)} \approx 1 - 6 \operatorname{Re}(\varepsilon'/\varepsilon)$$

Direct CP Violation

$$\Gamma(K^0 \rightarrow \pi^+ \pi^-) \neq \Gamma(\bar{K}^0 \rightarrow \pi^+ \pi^-)$$

Crucial CERN Experiments: **NA31 & NA48**

Cabibbo-Kobayashi-Maskawa (CKM) Quark Mixing Matrix

$$V_{CKM} = \begin{pmatrix} V_{ud} & V_{us} & V_{ub} \\ V_{cd} & V_{cs} & V_{cb} \\ V_{td} & V_{ts} & V_{tb} \end{pmatrix}$$

(PDG 2012)

$$|V_{ud}| = 0.97425 \pm 0.00022$$

$$|V_{us}| = 0.2252 \pm 0.0009$$

$$|V_{cd}| = 0.230 \pm 0.011$$

$$|V_{cs}| = 1.006 \pm 0.023$$

$$|V_{cb}| = (40.9 \pm 1.1) \times 10^{-3}$$

$$|V_{ub}| = (4.15 \pm 0.49) \times 10^{-3}$$

$$|V_{tb}| = 0.89 \pm 0.07$$

With 3 generations CP violation is naturally introduced by an irreducible complex phase in the quark mixing matrix (Kobayashi & Maskawa, 1973)

$$V_{CKM} = \begin{pmatrix} 1 - \lambda^2/2 & \lambda & A\lambda^3(\rho - i\eta) \\ -\lambda & 1 - \lambda^2/2 & A\lambda^2 \\ A\lambda^3(1 - \rho - i\eta) & -A\lambda^2 & 1 \end{pmatrix}$$

$0^+ \rightarrow 0^+$ super-allowed nuclear β decays

Kaon semi-leptonic and leptonic decays

$2\mu/1\mu$ ratio in neutrino/antineutrino interactions

Average of semi-leptonic D and leptonic D_s decays

Combination of exclusive and inclusive B decays

Comb. of exclusive and inclusive charmless B decays

Single top-quark production cross-section

V_{td} & V_{ts} accessible from FCNC processes (loops)

CP-Violation in Kaons and CKM

Neutral Kaon Mixing ($\pi\pi$, semi-leptonic)

$$|\varepsilon| = \frac{G_F^2 f_K^2 m_K m_W^2}{12\sqrt{2}\pi^2 \Delta m_K} \hat{B}_K \left\{ \eta_1 S(x_c) \text{Im}(V_{cs} V_{cd}^*)^2 + \eta_2 S(x_t) \text{Im}(V_{ts} V_{td}^*)^2 \right. \\ \left. + 2\eta_3 S(x_c, x_t) \text{Im}(V_{cs} V_{cd}^* V_{ts} V_{td}^*) \right\}$$

$$|\varepsilon| = (2.233 \pm 0.015) \times 10^{-3}$$

Neutral Kaon Decays into $\pi\pi$

PDG Average

$$\text{Re} \frac{\varepsilon'}{\varepsilon} \propto \text{Im}(V_{td} V_{ts}^*)$$

$$\text{Re} \frac{\varepsilon'}{\varepsilon} = (1.67 \pm 0.23) \times 10^{-3}$$

Direct CP-Violation

V_{us} and universality

$$\frac{g}{\sqrt{2}} W_{\alpha}^{+} \left(\bar{\mathbf{U}}_L \mathbf{V}_{\text{CKM}} \gamma^{\alpha} \mathbf{D}_L + \bar{e}_L \gamma^{\alpha} \nu_{eL} + \bar{\mu}_L \gamma^{\alpha} \nu_{\mu L} + \bar{\tau}_L \gamma^{\alpha} \nu_{\tau L} \right) + \text{h.c.}$$

$$|V_{ud}|^2 + |V_{us}|^2 + |V_{ub}|^2 = 1$$

Standard-model coupling of quarks and leptons to W

Universality: Is G_F from μ decay equal to G_F from π , K , nuclear β decay?

$$G_{\mu}^2 = (g_{\mu} g_e)^2 / M_W^4 \stackrel{?}{=} G_{\text{CKM}}^2 = (g_q g_{\ell})^2 (|V_{ud}|^2 + |V_{us}|^2) / M_W^4$$

Physics beyond the Standard Model can break gauge universality:

V_{us} from semileptonic decays

$$\Gamma(K_{\ell 3}(\gamma)) = \frac{C_K^2 G_F^2 m_K^5}{192\pi^3} S_{EW} |V_{us}|^2 |f_+^{K^0\pi^-}(0)|^2 \times I_{K\ell}(\lambda_{K\ell}) \left(1 + 2\Delta_K^{SU(2)} + 2\Delta_{K\ell}^{EM}\right)$$

with $K \in \{K^+, K^0\}$; $\ell \in \{e, \mu\}$, and:

C_K^2 1/2 for K^+ , 1 for K^0

S_{EW} Universal SD EW correction (1.0232)

Inputs from experiment:

$\Gamma(K_{\ell 3}(\gamma))$ Rates with well-determined treatment of radiative decays:

- Branching ratios
- Kaon lifetimes

$I_{K\ell}(\{\lambda\}_{K\ell})$ Integral of form factor over phase space: λ s parameterize evolution in t

- K_{e3} : Only λ_+ (or λ_+', λ_+'')
- $K_{\mu 3}$: Need λ_+ and λ_0

Inputs from theory:

$f_+^{K^0\pi^-}(0)$ Hadronic matrix element (form factor) at zero momentum transfer ($t=0$)

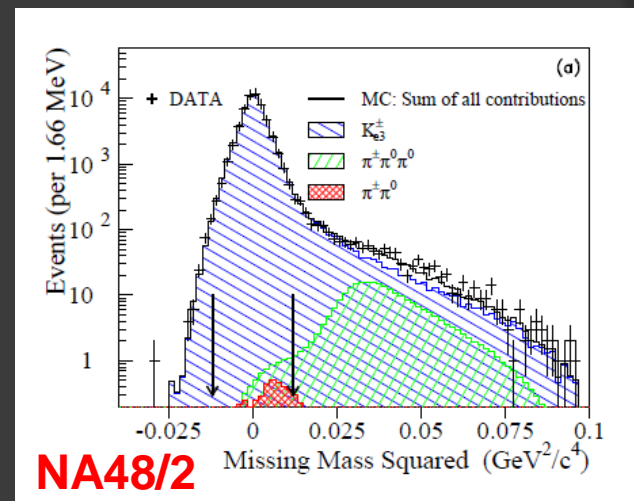

$\Delta_K^{SU(2)}$ Form-factor correction for $SU(2)$ breaking

$\Delta_{K\ell}^{EM}$ Form-factor correction for long-distance EM effects

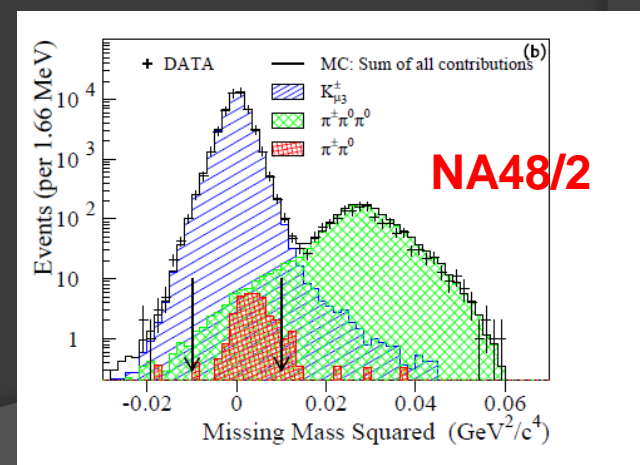

“Modern” V_{us} experimental input

$K^\pm \rightarrow \pi^0 e^\pm \nu$

Experiment	Measurement	Year
BNL865	$BR(K^+ \rightarrow \pi^0_D e^+ \nu) / BR(K^+ \rightarrow \pi^0_D X^+)$	2003
KTeV	$\tau(K_S)$	2003
	$BR(K_{Le3}), BR(K_{L\mu3}), \lambda_+(K_{Le3}), \lambda_{+,0}(K_{L\mu3})$	2004
ISTRA+	$\lambda_+(K_{e3}^-), \lambda_{+,0}(K_{e3}^-)$	2004
KLOE	$\tau(K_L)$	2005
	$BR(K_{Le3}), BR(K_{L\mu3}), BR(K_{Se3}), \lambda_+(K_{Le3})$	2006
	$\lambda_{+,0}(K_{L\mu3})$	2007
	$\tau(K^\pm), BR(K_{Le3}), BR(K_{L\mu3})$	2008
NA48	$\tau(K_S)$	2002
	$BR(K_{Le3}/2 \text{ tracks}), \lambda_+(K_{Le3})$	2004
	$BR(K_{Se3}/K_{Le3}), \lambda_{+,0}(K_{L\mu3})$	2007
NA48/2	$BR(K_{e3}^+/\pi^+\pi^0), BR(K_{\mu3}^+/\pi^+\pi^0)$	2007

$K^\pm \rightarrow \pi^0 \mu^\pm \nu$

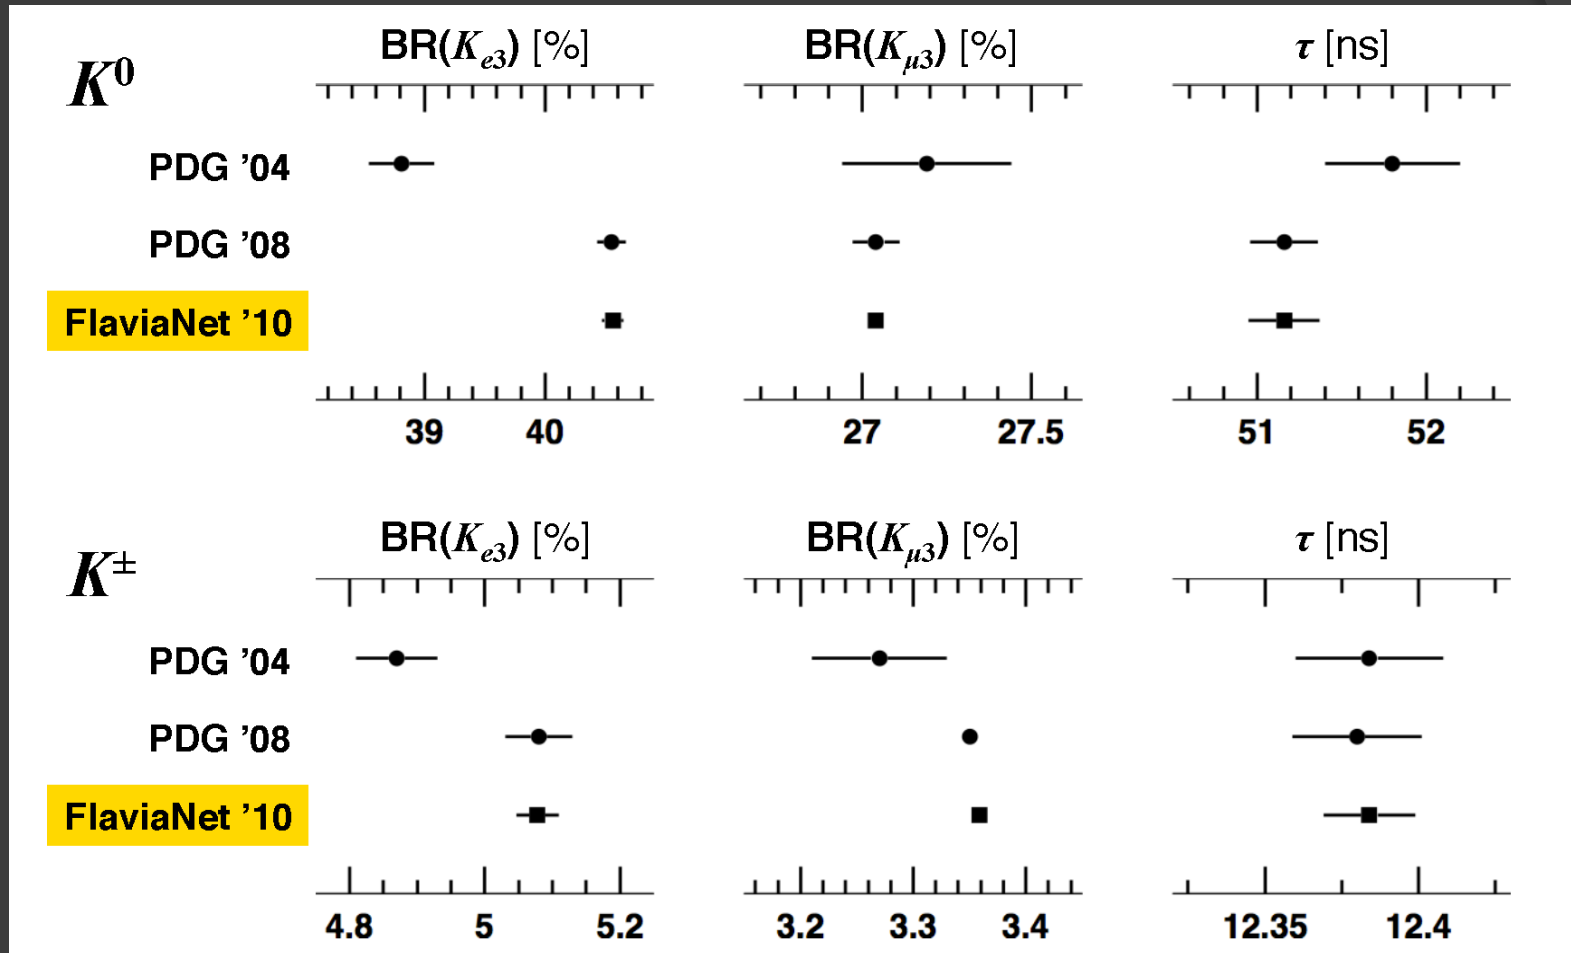

The experiments determine the product of

$V_{us} f_+(0)$ and $V_{us} f_K$

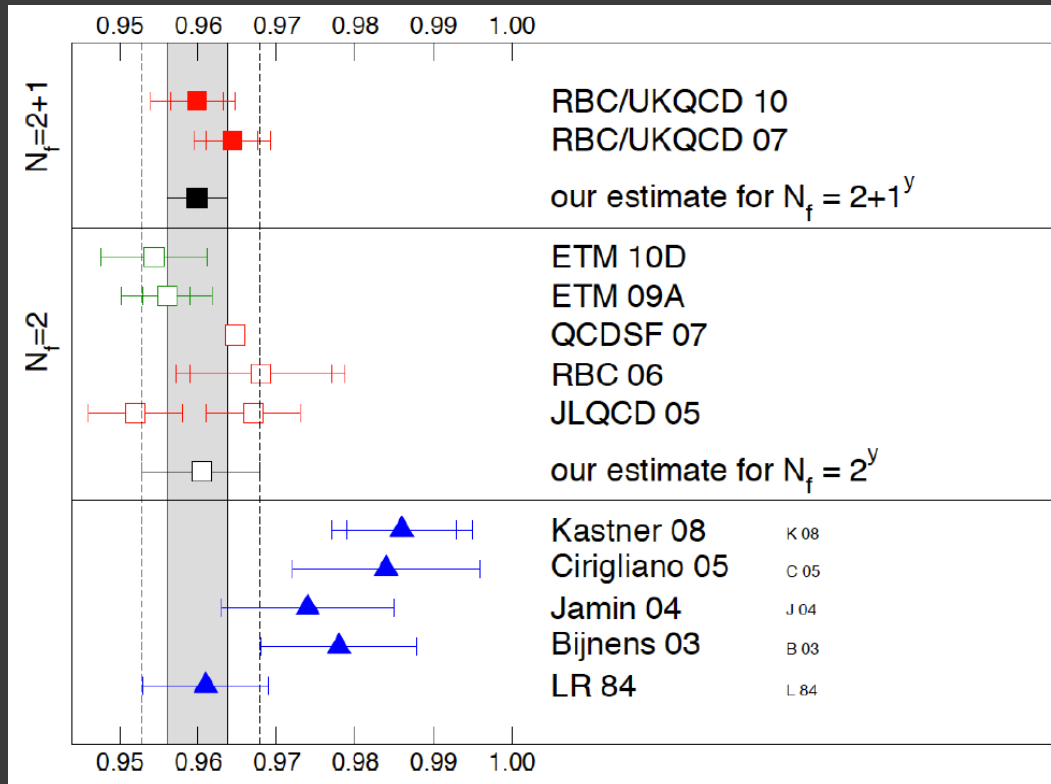

Precise theoretical calculations (lattice QCD and chiral perturbation theory) allow one to perform stringent tests. The theory works very well for kaons.

Evolution of Experimental Input...

“ V_{us} Revolution” with experimental input changing $\sim 5\%$ in some cases.....”

...and of the theoretical one $f_+(0)$

The LQCD calculations are Improving, for instance they go beyond “quenched” approximations ($N_f = 2$)

The **Cabibbo** angle can be precisely determined (**$\sim 0.4\%$**)!

Unitarity test of CKM the first row (PDG 2012):

$$|V_{ud}|^2 + |V_{us}|^2 + |V_{ub}|^2 = 0.9999 \pm 0.0006$$

LEPTON UNIVERSALITY

$$R_K = K_{e2}/K_{\mu2}$$

SM

$$R_K = \frac{\Gamma(K^\pm \rightarrow e^\pm \nu)}{\Gamma(K^\pm \rightarrow \mu^\pm \nu)} = \frac{m_e^2}{m_\mu^2} \cdot \left(\frac{m_K^2 - m_e^2}{m_K^2 - m_\mu^2} \right)^2 \cdot (1 + \delta R_K^{\text{rad. corr.}})$$

$$R_K^{\text{SM}} = (2.477 \pm 0.001) \times 10^{-5}$$

Cirigliano & Rosell PRL 99 (2007) 231801

BSM,
LFV

e.g. Masiero, Paradisi Petronzio
PRD 74 (2006) 011701,
JHEP 0811 (2008) 042

$$R_K^{\text{LFV}} \approx R_K^{\text{SM}} \left[1 + \left(\frac{m_K^4}{M_{H^\pm}^4} \right) \left(\frac{m_\tau^2}{M_e^2} \right) |\Delta_{13}|^2 \tan^6 \beta \right]$$

Example:

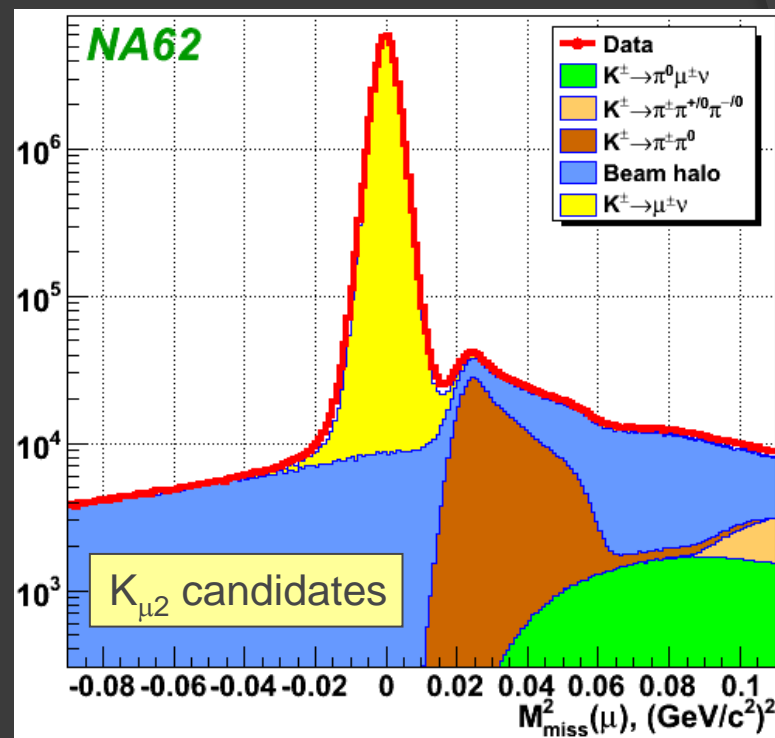

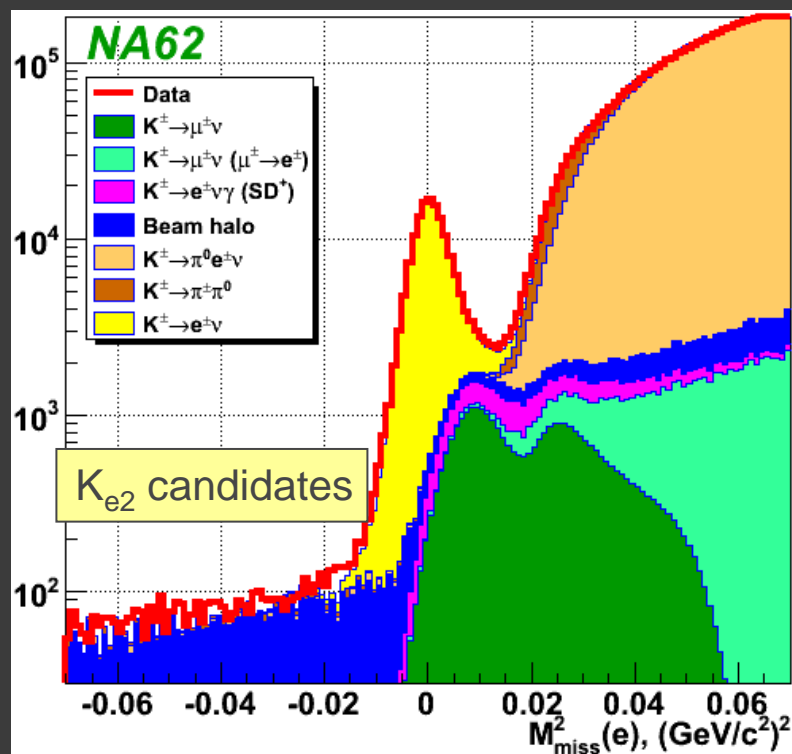

$$(\Delta_{13} = 5 \times 10^{-4}, \tan \beta = 40, M_H = 500 \text{ GeV}/c^2)$$

$$R_K^{\text{MSSM}} = R_K^{\text{SM}} (1 + 0.013).$$

Leptonic decays

STRONG INTERACTION AT LOW ENERGY

Strong Interaction at low energy

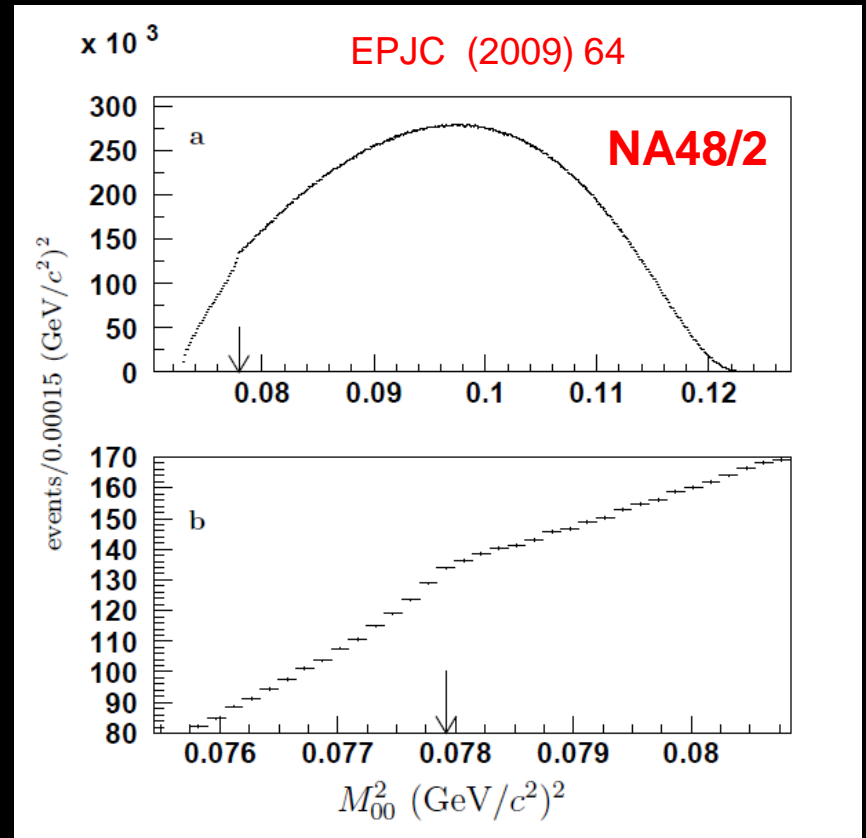

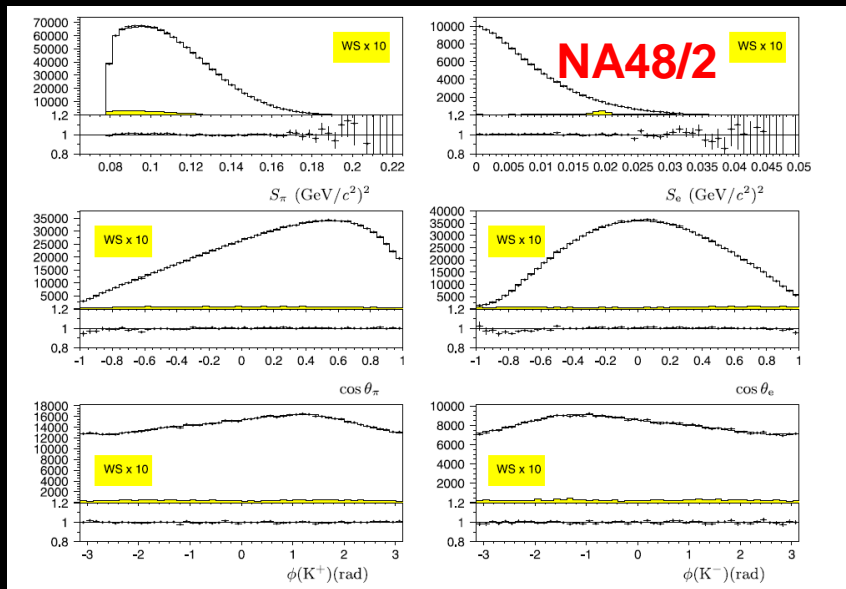

- ◉ At high energy the strong interactions are described by Quantum Chromo Dynamics (QCD)
- ◉ Below ~ 1 GeV, the strong coupling becomes large and the perturbative description is not possible
- ◉ An effective theory, Chiral Perturbation Theory (ChPT) allows to study the strong interaction at low energy in terms of momenta and light meson masses
- ◉ Kaons are a good laboratory to study the strong interactions at low energy ($\pi\pi$ scattering, radiative decays,...)

NA48/2: $K^\pm \rightarrow \pi^+\pi^-\ell^\pm\nu$ & cusp in $K^\pm \rightarrow \pi^\pm\pi^0\pi^0$ cusp

$K^\pm \rightarrow \pi^+\pi^-\ell^\pm\nu$ (Ke4)

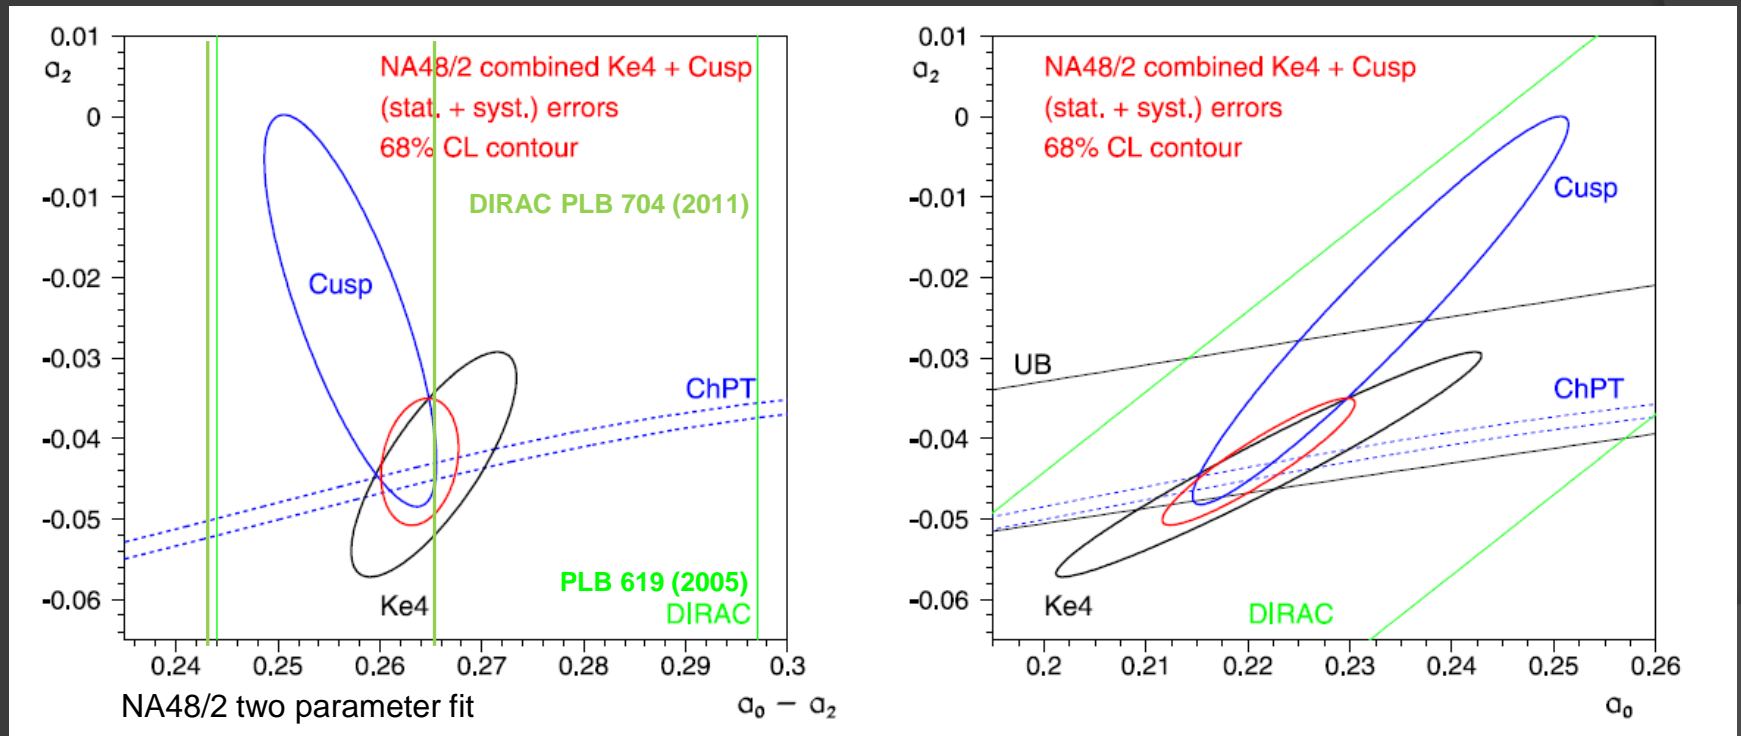

Cusp in $K^\pm \rightarrow \pi^\pm\pi^0\pi^0$ decays

Cusp-like structure at the $\pi^+\pi^-$ invariant mass threshold

$\pi\pi$ scattering length

NA48/2: EPJC (2010) 70

Consistent results on the scattering lengths obtained with completely independent techniques

RARE DECAYS

Looking for physics beyond the SM

- ◎ Direct searches: LHC energy frontier
- ◎ Indirect searches:
 1. Improve measurement precision of CKM elements
 - Compare measurements of the same quantities which may or may not be sensitive to new physics
 - Extract all CKM angles and sides in many different ways → **inconsistencies would signal new physics**
 2. Study Flavour Changing Neutral Currents (FCNC) processes where the SM contributions are suppressed and precisely predictable → **Rare Decays**

Remarkable stopped kaon experiment

- Must bridge the existing gap between theory and experiment
- A measurement of $\text{BR}(K^+ \rightarrow \pi^+ \nu \nu)$ to 10 % determines V_{td} without input from Lattice QCD
- The strong suppression of the SM component ($< 10^{-10}$) offers good sensitivity to NP

$K^+ \rightarrow \pi^+ \nu \nu$ in SM

$$\delta |V_{td}| / |V_{td}| \approx 0.4 \delta P_c / P_c \oplus 0.7 \delta BR / BR \oplus \delta |V_{cb}| / |V_{cb}|$$

NA62 Vetoes

- Photon vetoes to reject $K^+ \rightarrow \pi^+ \pi^0$

$$P(K^+) = 75 \text{ GeV}/c$$

$$\text{Requiring } P(\pi^+) < 35 \text{ GeV}/c$$

$P(\pi^0) > 40 \text{ GeV}/c$  It can hardly be missed in the calorimeters

8 orders of magnitude π^0 suppression required

Signature:

- Incoming **high momentum** K^+
- Outgoing **low momentum** π^+

- Muon Veto to reject $K^+ \rightarrow \mu^+ \nu$

The NA62 A1-A8 LAV Stations
all installed in ECN3

NA62 photon vetoes: expected π^0 rejection $\sim 5 \times 10^{-8}$

Expected background from $K^+ \rightarrow \pi^+ \pi^0$ as fraction of the $K^+ \rightarrow \pi^+ \nu \nu$ (SM) signal as a function of the kaon decay vertex

Straw Tracker in NA62

- There are two main performance requirements for secondary particles:

From this follow the main requirements on the straw detector:

- ◆ Spatial resolution $\leq 130 \mu\text{m}$ per coordinate and $\leq 80 \mu\text{m}$ per space / point
- ◆ $\leq 0.5\%$ of a radiation length (X_0) for each chamber
- ◆ Installation inside the vacuum tank ($P < 10^{-5}$ mbar) with minimum gas load for the vacuum system ($\sim 10^{-1} \text{ mbar} \cdot \text{l/s}$)
- ◆ For straws near the beam, operation in a high rate environment (up to 500kHz/Straw)
- ◆ Possible multiplicity veto for triggering

Straw production

Straws are handled and transported under pressure

- PET 36 micron thick
- 9.9 mm diameter
- 50 nm copper
- 20 nm gold
- Ultrasound weld

Module assembly – straw insertion

Giuseppe Ruggiero

Missing Mass Resolution

Kinematic Rejection

- × **The simulation includes:**
- × Multiple and Single large angle Coulomb scattering
- × δ -rays
- × Elastic and inelastic nuclear interactions
- × Errors in the straw spectrometer pattern recognition

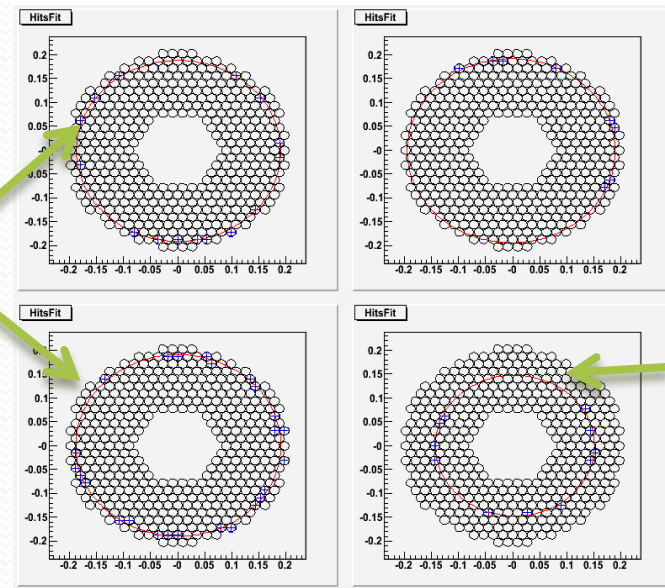

NA62 RICH

- $K_{\mu 2}$:largest BR: 63.4%
- Need $\sim 10^{-12}$ rejection factor
- Kinematics (GTK +STRAW) : $\sim 10^{-5}$
- Muon Veto: $\sim 10^{-5}$
- Particle ID (RICH): $\sim 10^{-2}$

20 GeV/c

positrons

Rings in NA62 RICH prototype

- Essential to match the pion track seen by the straw with track (kaon) seen by the beam spectrometer (rate: 800 MHz)
- To avoid a wrong match which spoils the kinematic suppression, the RICH must measure the pion time to 100 ps or better to connect to the kaon measured in the GTK
- Radiator: 17 m neon atmospheric pressure; spherical glass mirrors (17m focal length; ~ 2000 Hamamatsu PMT R7400U-03)

RICH400: performance

NA62 Sensitivity

Decay Mode	Events
Signal: $K^+ \rightarrow \pi^+ \nu \nu$ [flux = 4.8×10^{12} decay/year]	55 evt/year
$K^+ \rightarrow \pi^+ \pi^0$ [$\eta_{\pi^0} = 2 \times 10^{-8}$ (3.5×10^{-8})]	4.3% (7.5%)
$K^+ \rightarrow \mu^+ \nu$	2.2%
$K^+ \rightarrow e^+ \pi^+ \pi^- \nu$	$\leq 3\%$
Other 3 – track decays	$\leq 1.5\%$
$K^+ \rightarrow \pi^+ \pi^0 \gamma$	$\sim 2\%$
$K^+ \rightarrow \mu^+ \nu \gamma$	$\sim 0.7\%$
$K^+ \rightarrow e^+ (\mu^+) \pi^0 \nu$, others	negligible
Expected background	$\leq 13.5\%$ ($\leq 17\%$)

The **ORKA** proposal at FNAL plans to extend significantly the sensitivity of the BNL stopped kaon technique (4th generation experiment), while the **KOTO** experiment at J-PARC addresses $K_L^0 \rightarrow \pi^0 \nu \bar{\nu}$ with a pencil beam

NEUTRINOS: CNGS1 OPERA

OPERA Experiment

- **O**scillation **P**roject with **E**mulSION-**t**Racking **A**pparatus
- Designed to make the first detection of neutrino oscillation in direct **appearance mode** through the study of $\nu_\mu \rightarrow \nu_\tau$.
- OPERA is a hybrid detector consisting of emulsion/lead target complemented by electronic detectors
- It is placed in the high energy long-baseline CERN to LNGS beam (CNGS) 730 km away from the neutrino source
- The CNGS beam has enough energy to be above the τ threshold
- First ν_τ candidate event: Phys. Lett. B 691 (2010)

Opera first τ Candidate

Variable	Cut-off	Value
Missing P_T at primary vertex (GeV/c)	<1.0	$0.57^{+0.32}_{-0.17}$
Angle between parent track and primary hadronic shower in the transverse plane (rad)	$> \pi/2$	3.01 ± 0.03
Kink angle (mrad)	>20	41 ± 2
Daughter momentum (GeV/c)	>2	12^{+6}_{-3}
Daughter P_T when γ -ray at the decay vertex (GeV/c)	>0.3	$0.47^{+0.24}_{-0.12}$
Decay length (μm)	<2 lead plates	1335 ± 35

Phys. Lett. B 691 (2010)

Opera second τ Candidate

Years	Status	# of events for Decay search	Expected ν_τ (Preliminary)	Observed ν_τ Candidate Events	Expected BG for ν_τ (Preliminary)
2008-2009	Finished	2783		1	
2010-2011	In analysis	1343		1	
2012	Started				
Total		4126	2.1	2	0.2

@ Neutrino-2012, Kyoto

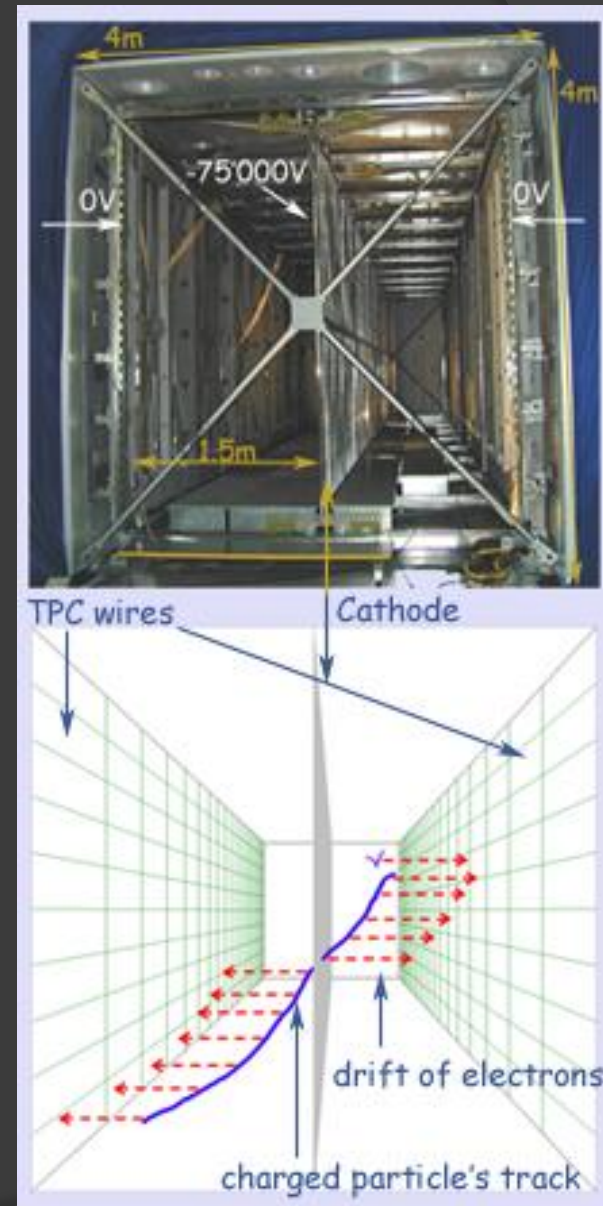

Charm Data/MC comparison

NEUTRINOS: CNGS2 ICARUS

ICARUS Concept

- The Liquid Argon Time Projection Chamber: A New Concept For Neutrino Detector
C. Rubbia, CERN-EP/77-07 (1977)
- Innovative liquid argon time projection chamber, suitable for large volumes applications
- Spatial resolution comparable to that of bubble chambers but fully electronic

ICARUS T600 Detector

Taking data in LNGS hall B

Two identical modules

- $3.6 \times 3.9 \times 19.6 \sim 275 \text{ m}^3$ each
- Liquid Ar active mass: $\sim 476 \text{ t}$
- Drift length = 1.5 m (1 ms)
- HV = -75 kV $E = 0.5 \text{ kV/cm}$
- $v\text{-drift} = 1.55 \text{ mm}/\mu\text{s}$

•4 wire chambers:

- 2 chambers per module
- 3 readout wire planes per chamber, wires at $0, \pm 60^\circ$
- ~ 54000 wires, 3 mm pitch, 3!mm plane spacing
- **20+54 PMTs , 8" Ø, for scintillation light detection:**
 - VUV sensitive (128nm) with wave shifter (TPB)

ICARUS T600 physics potential

- For 10^{20} pot:

- ~2800 CC events
- ~900 NC events
- $\nu_\mu \rightarrow \nu_\tau$
- $\nu_\mu \rightarrow \nu_e$
- Sterile neutrinos
- ...

- Self-triggered events

- atmospheric ν CC interactions
- Proton decay $3 \cdot 10^{32}$ nucleons
- ...

T600 is a milestone towards the realization of multikton Lar detectors

ICARUS Energy Reconstruction

M. Antonello et al. Phys.Lett. B711 (2012) 270-275

ICARUS: Electronic Bubble Chamber

Shown at NEUTRINO-2012
In Kyoto by F. Pietropaolo

Track	E_{dep} [MeV]	range [cm]
1(p)	185 ± 16	15
5(p)	192 ± 16	20
7(p)	142 ± 12	17
8(π)	94 ± 8	12
9(p)	26 ± 2	4
10(p)	141 ± 12	23
11(p)	123 ± 10	6

Flavour & Neutrinos at SPS: Summary

- Possible longer term evolution of this of the CERN programme:

- Flavour: test the SM relation

$$(\sin 2\beta)_{K \rightarrow \pi \nu \bar{\nu}} = (\sin 2\beta)_{B \rightarrow J/\psi K_s}$$

by studying very rare decays of both charged and neutral kaons

- Neutrinos:
 - Long baseline experiments to address the neutrino **mass hierarchy** and **CP violation in the leptonic sector**
 - Short baseline experiments (e.g. P347) to clarify the situation of **sterile neutrinos**

Acknowledgements

- ⦿ I have adapted material taken from the presentations of many of my colleagues in NA48/NA62 and public presentations made by the OPERA and ICARUS Collaborations
- ⦿ These Collaborations deserve the credit
- ⦿ I hope I succeeded to entice interest for the research programme that can be performed at the SPS
- ⦿ The SPS is not just an injector: it has a unique physics programme with kaons, neutrinos, muons, ions and hadron beams
- ⦿ I think that the overall CERN scientific programme is worth more than the sum of its single parts
- ⦿ Thank you
