

INTERNATIONAL MASTERCLASSES HANDS ON PARTICLE PHYSICS

<http://physicsmasterclasses.org/neu/index.php?cat=press>

Yiota Foka

For IPPOG Masterclass group

IICFP 12.06.2012 Kolymbari, Crete

Outline

IPPOG: aims and activities

IPPOG outreach collection:

recommended tools and materials for formal and informal education settings

How to bring the exciting world of particle physics to students of all ages, teachers and the general public.

How to benefit from the work of IPPOG and join in its activities.

<http://physicsmasterclasses.org/neu/index.php?cat=press>

IPPOG

IPPOG: International Particle Physics Outreach Group

It is a network of particle physicists, researchers, informal science educators, engaged in worldwide outreach and informal science education for particle physics.

IPPOG's aim is to raise awareness, understanding and standards of global outreach efforts in particle physics and general science.

Masterclasses

IPPOG initiated several major worldwide activities, such as the well-established “International Particle Physics Masterclasses”.

The Masterclasses is an educational activity that brings the excitement of cutting-edge particle physics research into the classroom.

Each year, since 2005, thousands of high school students in many countries all over the world come to universities or research centres near to their school for one day in order to be “scientists for a day” and unravel the mysteries of particle physics.

Masterclasses in a nutshell

The International Masterclasses

- provide the opportunity for 15- to 19-year old students to discover particle physics
- are organized every year in March over 4 weeks
- are organized by TU Dresden and an international steering group in the framework of the International Particle Physics Outreach Group (IPPOG)

In 2012, 10000 students from 130 institutions in 31 countries took part in the popular event over 4 weeks

Aims of Masterclasses

The aim is to get insight into topics and methods of basic research

The aim is NOT TO TEACH particle physics

Program of the day

School-children get out of school for one day and come to a university or research centre near to the school

- Attend lectures
- Visit a lab

- Perform measurements on real data from particle physics experiments at CERN
- Discuss results locally, prepare presentation, perform a quiz

- Participate in an international video conference (moderated by CERN or Fermilab) to discuss the results with other groups that did the same measurements

Masterclass methods

- **Tools:** Event display programs, software tools and analysis methods are demonstrated by tutors and quickly mastered by students.
- **Measurement:** Students use the tools to measure various properties of some known particles, such as the weak gauge bosons W and Z and hadrons (Jpsi, Upsilon, Lambda, K-short).
- **Interpretation:**
 - The concept of invariant mass is first used to identify and measure masses and widths of short-lived particles.
 - It is then applied to look for new particles (Higgs) or new state of matter (Quark-Gluon Plasma)
 - The fractions of W^+ and W^- events are interpreted in terms of quark structure of the proton....

Videoconference

- At the end of each day, the participants join in a videoconference moderated by CERN or Fermilab for discussion and combination of their results using tools as in our international research collaborations.
- The combined results are then compared to recent results published by the experiments.

Participation

Masterclasses 2012 in numbers

Period: 28.2. – 24.3.2012 (21 days) (10 in U.S.)

- 143 Masterclasses (30)
 - ALICE: 13 (0)
 - ATLAS W: 42 (0)
 - ATLAS Z: 53 (13)
 - CMS: 35 (18)
- 36 video conferences with CERN (11 with Fermilab)
- 21 moderators (8)
- 117 institutes registered (30)

The same Masterclasses were also performed „locally“
(teacher days)

Participation

■ Participants

■ Institutes ■ US program

■ Countries

Interest expressed for 2013:

- India (Mumbai)
- China
- Australia
- Georgia
- Romania
- Cyprus
- middle east?

How is it organised?

Masterclasses in practise

The steering group contacts the national representatives who contact universities and research institutes of their countries.

The universities invite schools of their area for one day.

Interested school children are selected or whole classroom participates.

Role of Masterclass Steering Group

- The steering group oversees the project and coordinates the activities
- Contacts the national representatives who contact the universities and schools.
- Prepares the exercises and quiz
- Provides material in web pages (translations in different languages)
- Provides CDs with material
- Prepares videoconference
- Prepares tutors
- Prepares moderators
- Feedback and surveys

Masterclass web page and material

Web page

<http://physicsmasterclasses.org/neu/index.php?cat=press>

Several Masterclass packages are on the web together with support material for the tutors (scientists at universities) and moderators

- Explain the physics
- Explain how to set it up (technical)
- Suggestions on the discussion of the results
- Quiz

Hands on Particle Physics Masterclasses ORGANISATION

Welcome in the organisation section of the IPPOG Masterclasses!

Here, we hope to provide you with all that you'll need in order to organise an event that students, teachers and staff will never forget.

Therefore, you can find:

- an **introduction** to the overall organising scheme
- some example **lectures**

- information on the **measurements**

- a **manual** for the video conference, including information on the new quiz

- corporate material** to prepare e.g. invitation letters or participation certificates

- english press release**
- german press release**

We also provide information how we would like to

- present participating institutes** on our website or how you can
- contribute in translating the exercises.**

SCHEDULE 2012

The central element of International Masterclasses 2012 will be the International Masterclass weeks from 27.02.12 - 24.03.12, where each day up to five out of about 130 institutes participate. In addition, [U.S. institutes](#) have their own Masterclasses, and [separate Institute Masterclasses](#) take place, distributed over the whole year. For details on registration and travel to the institutes see: [Participation](#). Some institutes will also hold a [teachers day](#) (similar program, but without video conference).

	Mon, March 5	Tue, March 6	Wed, March 7	Thu, March 8	Fri, March 9	Sat, March 10
topic		VC 1: ATLAS W	VC 1: ATLAS Z	VC 1: ATLAS Z	VC 1: ATLAS Z	VC 1: ATLAS W

MEASUREMENTS

Measurements are available from the web and from DVDs which will be sent out to all Masterclasses institutes. During the measurements students evaluate event displays from proton-proton collision at LHC. Four different packages with data from one of three experiments at the LHC are available:

- ALICE
- ATLAS
- CMS

ALICE

The measurement with ALICE data can be found [here](#). The ALICE measurement includes:

- Measurement of strange particles based on their decay pattern
- Event animations from real pp data at 900 GeV and 7 TeV
- Event animations from PbPb simulated data (at the moment); soon real data too
- Available in English, French, Italian, German, Czech, and Portuguese.

Supporting material:

- [Instructions for tutors](#), including proposed outline for the day, proposed questions and answers (2011 version; will be updated soon).
- A **spreadsheet** for local combination of results can be found [here](#) (2011 version; will be updated soon)
- Film and presentation on "Heavy Ion Physics and ALICE experiment"
- Animation of the ALICE experiment and detector elements
- Animation of Pb+Pb collision creating QGP from a model (URQMD)

Some moderators

The moderators 2012 are:

Kate Shaw
(ATLAS)

International Masterclass am 19.3.2012

General Idea

Example: CMS W/Z Investigation

- 1900 Events:
 - W and Z
 - Background
 - “Mystery” events 2-12 GeV
- Students sort events by:
 - Lepton flavor (e or μ).
 - Candidacy (W or Z).
 - Charge (W+ or W-).
- Find:
 - W+/W-.
 - e/ μ .
 - Z mass.
 - W/Z (challenge).

UC Riverside physics Professor Bill Gary, standing on left, and San Jacinto High School teacher Mark Bonnard assist San Jacinto High physics students, left to right, Jensine Junus, Anna Sivils, Jesus Mondragon Legorreta and Cristina Millar, analyze particle physics data from the European Center for Nuclear Research.

How did the quiz work?

What about the students?

Nantes

General Feedback from Moderators

It was fun, see you next year!

I liked the structure better every year and it's always much easier to take part!

The masterclasses were great, please get together next year and it's always much easier to take part!

Could you make it easier to take part?

That structure was better every year and it's always much easier to take part!

Masterclass aims in detail

Aims of Masterclass

- On a basic level: students should (e.g. via lectures)
 - be *informed* (not taught) about
 - the new age of exciting discoveries in particle physics (HEP); big questions/possible discoveries at the Large Hadron Collider and in the “masterclass” experiment
 - central findings of hep research in last ~30 years (standard model, building blocks, forces, charges,...)
 - status of “masterclass” experiment (ATLAS, CMS, ALICE or LHCb)
 - get insight in the way hep research is organized
 - in international collaborations
 - in dialogue/exchange of experiment and theory
 - wrt. methods of discovery of new phenomena (counting methods, mass peaks, etc.)
 - methods or and reasons for calibrating detectors

Aims of Masterclass

- Students should *learn* themselves to
 - identify different particles via their pattern in detectors
 - categorize events of (LEP and) LHC in pre-defined final states
 - do a measurement of a physics observable
(LEP: e.g. Z branching fraction, ratios of branching fractions;
LHC: e.g. ratio of W^+ / W^-)
 - interpret this measurement and get basic insights from it
using theoretical/phenomenological arguments
(lepton universality, number of color charges, proton structure)
 - combine results (different groups, different experiments) to improve results
 - identify events which would be candidates for new physics
and qualitatively understand pre-conditions for claiming a discovery
(e.g. WW or ZZ events as Higgs candidates, 3 lepton events as SUSY candidates)

Aims of Masterclass

- Get the feeling that they:
 - understand the basic principles about how particles are identified
 - are able to perform themselves some of the measurements, which the scientists currently do, on a somewhat simplified level
 - are able to draw conclusions from these measurements
 - understand the way modern particle physics research is organized
- get the impression that
 - topics of fundamental research in natural science are interesting
 - its results are relevant as cultural knowledge of mankind

From U.S. Surveys (not yet complete)

Prelim: How did you like the masterclass you attended today?

Prelim: What did you like *best* about the masterclass?

Prelim: Video link rating

Note "plushy" Higgs boson
(discovery claimed by students)

What are our aims, after all?

- Make students feel like a researcher for one day
 - They do „measurements“ (!), not exercises
 - They feel able to „do it themselves“
 - They understand the basic concepts
- They understand the meaning of their measurement
 - What did they find out?
 - Where does it play a role in our Universe?
- They understand the scientific process
- Not try to teach the whole Standard Model in one day
but just fascinate by sharing authentic fundamental research

Improving: issues to consider

- Stability of measurement tasks
 - Pro: easier organisation
 - Contra: exciting to follow what scientists do
- Severity of measurement tasks .vs. upcoming boredom
 - Work harder in few events or go through many events ?
 - Be as close as possible to scientists ‘ real way of working or just measuring the same quantities differently (by visual inspection)
- How to assure that students understand
 - what questions scientists are after?
 - how scientists solve these in practice?
- How to balance between
 - use of automatic tools (danger: black box)
 - real, but tedious hands-on working (curvature, zooming, counting...)

Improving: issues to consider

- Diversity versus Unification
 - wrt tools for histogramming and combining
- How to assure that 120 institutes can join in?
 - normally by far not all experts, need some stability
- International use .vs. local use
 - One measurement version for both? Or two variants?
 - One website for both (via „metro plan“) or two?
- How to really test the tools before the events?

Funding

- Helmholtz-Alliance (until end of 2012): coordinator
- BMBF (ending 6/2012): upgrade on LHC data, DVDs
- EPS HEP Division: DVDs
- Plus in kind contributions (CERN, moderators, ...)

IPPOG International Masterclasses

Report of New Measurements Working Group

ATLAS W-Path

- „real data“ preselected events ($W \rightarrow \ell n$)
- W charge asymmetry \rightarrow structure of the proton
- 5 *simulated* $H \rightarrow WW$ \rightarrow search for yet undiscovered

For 2012:

- 10 000 *real data* preselected events ($\sim 2000 W \rightarrow \ell n$)
 - different set of data for each institute, can be compared for consistency and combined in the video conference.
 - include 250 *candidates* $WW + 0$ jets at an early stage of the selection, (i.e. including considerable background)
 - too early for 2012? Fallback solution: MC data
- \rightarrow students measure opening angle between 2 leptons and combine their results in histogram for angular distribution

ATLAS Z-Path

- 700 *real data* preselected events ($\sim 300 Z \rightarrow \ell\ell$)
- Find Dilepton events \rightarrow calculate invariant mass
- 300 *simulated* $Z' \rightarrow \ell\ell$ \rightarrow search for yet undiscovered
- Derive mass spectrum

- Discuss importance of invariant mass concept
- Discuss meaning of finite width
- Discuss meaning of new mass peaks (Z' , not shown)

ATLAS Z-Path

Plans for 2012:

- larger data sample
- Also J/Psi and Upsilon
- Identify search for dilepton events
- php tool for mass plots under development

iSpy Online

New Features for W/Z:

- Missing Et vector
 - And slider
- Changes in controls
 - Numbers of objects – gone
 - Electron tracks moved

ALICE measurements

ALICE

“Heavy-ion” experiment at LHC (study Lead-on-Lead collisions)

Investigation of quark-gluon plasma properties

ALICE measurements

Physics Motivation: Looking for Quark-Gluon Plasma

- How to create it? In high energy collisions of Lead-on-Lead
- How to “see it”? Look for its “card-visit” (its signature)

Signatures of QGP: special features in PbPb compared to “normal matter” (pp)

- Huge temperature and density
- Strange particle enhancement
- Energy Loss: Nuclear modification factor RAA

Experimental Observables

- We have no “thermometer”; use particle ratios
- “Count” strange particles (K^0_s , Λ , Ξ^-) in PbPb and pp; compare
- “Count” charged particles in PbPb and pp; compare

ALICE measurements

The tools

- Simplified event display, close to the real one used at the experiment
- Visual analysis of small event sample
- Large statistics analysis including background and “writing code”

The data

- First LHC data (900 GeV proton proton) : develop / run masterclasses 2011
- 7 TeV proton proton data in 2012
- 2.76 TeV Pb-Pb data in 2012

Excercise 1: decay patterns of strange particles
developed 2010-11

Excercise 2: momentum spectra of unidentified particles (RAA)
developed 2012

INTERNATIONAL

MASTERCLASSES

Leticia, Peter	Leticia, Constantin	Guilherme, Pasquale
Oslo 	Prague CTU 	Clermont-Ferrand 
Bergen 	Copenhagen 	Geneva CERN 
Heidelberg 	Nantes 	São Paulo 
Frankfurt 		Nantes 
Darmstadt 		Santiago de Compostela 

Goals

Introduce basic concepts; try to keep number of required physics and analysis concepts to a minimum

Two step analysis approach

- introduce the idea in a visual, hands-on analysis
- large scale analysis close to what we do in real life
- let's write some analysis code together!

Emphasize the importance of collaborative work

- Different groups of students and institutes analyse different sets of events
- Combine, compare at the end

Visual analysis

Proton-proton (pp) event

Introduce concepts and visual analysis tools

ALICE Detector

Exit

The interface displays a large central event visualization showing tracks and clusters in a detector geometry. The tracks are primarily green, radiating from a central vertex. The detector geometry is shown in various colors (blue, purple, pink, yellow, brown) representing different detector components. To the right, there are two smaller inset displays. The top inset shows a zoomed-in view of the central region with tracks and clusters, with axes ranging from -1000 to 1000. The bottom inset shows a zoomed-in view of the detector geometry, with axes ranging from -800 to 800. The bottom inset also shows tracks and clusters within the detector structure.

Visual analysis

Lead-Lead (PbPb) event

Visual impressions: PbPb is different than pp

Visual analysis has limits

The screenshot displays the ALICE event viewer interface. On the left, a control panel includes sections for 'Student Instructions' (with an 'Instructions' button), 'Event Navigation' (with 'Previous', 'Current', and 'Next' buttons, showing '33 / 34' events, and 'Event analysed' and 'Events done: 0' indicators), 'Analysis Tool' (set to 'PbPb, semi-central' with a 'Counter' button), 'Display' (checkboxes for 'Vertex', 'Clusters', and 'Tracks', and buttons for 'Show primary tracks only', 'Geometry', 'Axes', and 'Background'), and 'Encyclopaedia' (with an 'ALICE Detector' button). At the bottom left is the ALICE logo with the tagline 'A JOURNEY OF DISCOVERY'. The main area is divided into three views: a large central 'Viewer 1' showing a 2D event display with a dense green and blue particle distribution; a top-right 'Multi View' showing a top-down view of the detector geometry with a red track; and a bottom-right 'Event Characteristics' view showing a 3D detector geometry with a red track. An 'Exit' button is located at the bottom center.

physics lesson

Pb-Pb collision \neq many independent pp collisions

Comparison of pp events and Pb-Pb collisions with different collision geometries

Collision geometry

cartoon of a Pb-Pb collision

More central (head-on) collisions produce more particles (higher multiplicity)

Peripheral collisions produce small number of particles (proton-like)

Necessary concepts

Geometry of Lead-Lead Collisions (centrality)

Reconstruction of charged particle trajectories from hits in tracking detectors (ALICE TPC in this case)

easily explained in visual analysis

Step 1: Momentum measurement via curvature of tracks in a magnetic field

visual analysis

Momentum Spectra

not needed: particle identification, particle decays, quantum numbers ...

Step 2: Reconstruction of decay patterns (secondary vertices)

visual analysis: identify decay pattern

Strange Particle Decay Patterns

Excercise 1

Strange Particles

Visual identification of patterns of decays of strange particles

$$K_s^0 \rightarrow \pi^+ \pi^-$$

$$\Xi^- \rightarrow \pi^- \Lambda \rightarrow \pi^- p \pi^-$$

Bachelor (single track) and two opposite tracks coming from a secondary vertex

$$\Lambda \rightarrow \pi^- p$$

$$\text{anti } \Lambda \rightarrow p^- \pi^+$$

Two opposite tracks from a secondary vertex

Simulated Pb Pb event

Analysis tools

Simplified ALICE event display

3 views of ALICE – 3D, $r\phi$, rz

Highlights decay patterns

Recognise from decay pattern

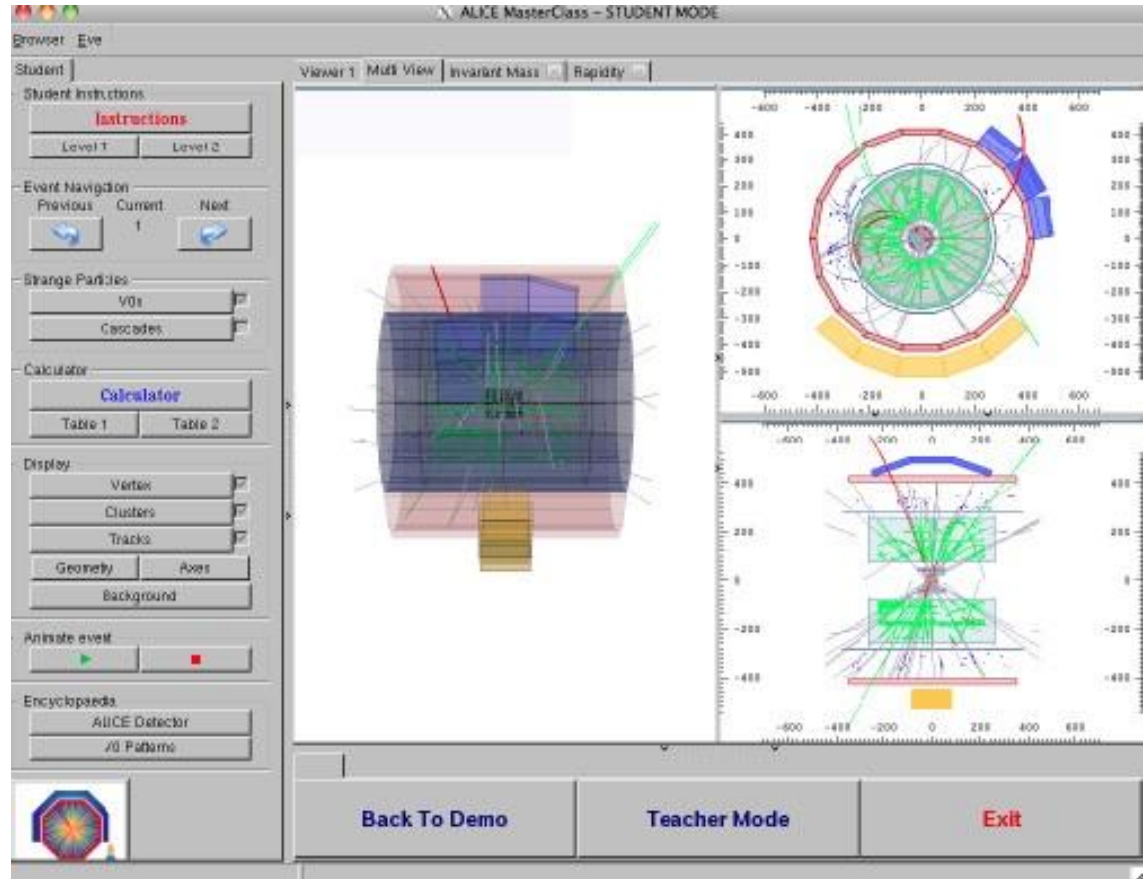

Calculate invariant mass

Classify according to mass

MasterClass Application

The screenshot displays the ALICE MasterClass application interface. The main window is titled "ALICE MasterClass - DEMO MODE" and features a central 3D visualization of a particle detector with tracks. The interface is divided into several panels:

- Calculator:** A panel on the left with a table of particle types and masses, and a calculator interface for calculating invariant mass.
- Particle Table:** A table listing particle types and their masses in GeV/c².
- Navigation:** Buttons for "Previous", "Current", and "Next" to navigate through tracks.
- Particle Data:** Two panels, "(-) Particle" and "(+) Particle", showing momentum components (X, Y, Z) and mass for selected tracks.
- Buttons:** A large "I'm ready! Start Exercise" button at the bottom center, and several identification buttons like "That's a Kaon!", "That's a Lambda!", etc., on the left.

Particle Table:

Particle type	Mass [GeV/c ²]
Electron	0.000511
Pion	0.139
Neutral Kaon	0.497
Proton	0.938
Lambda	1.115
Charged Xi	1.321

Anti-Lambdas

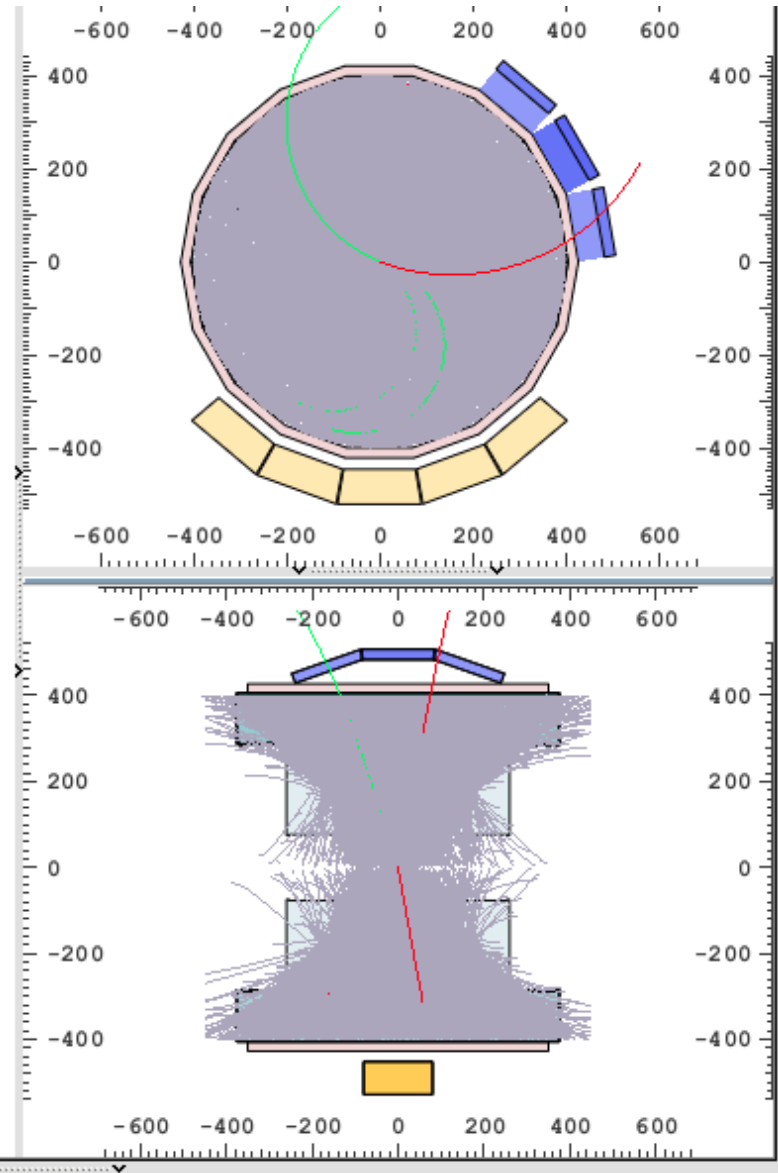

Strange Particles Extended

- New in 2012: 2nd part of exercise, more realistic
- Analyse big event sample (2000 events)
- Invariant mass histograms for Ks, Lambda, anti-Lambda
- Introduce background, background subtraction
- Get number of Ks, Lambda, anti-Lambda after background subtraction

The problem with Lead-Lead events

Outline of exercise

- **Students (each group):** Visual analysis of 30 events – tables + invariant mass histograms
- **Institute (all groups):** Add up numbers / merge histograms
 - 30-event samples for visual analysis, 7 TeV proton-proton (6)
 - 5-event sample Pb-Pb (1)

- **Students (each group):** Analysis of 2000 events - invariant mass histograms
- **Students (each group):** Try to fit background / peak / subtract -> find number of particles
- **Institute (all groups):** Merge histograms
- **Institute (all groups):** Fit background / peak / subtract -> find number of particles
 - 2000 event samples 7 TeV proton-proton (7)
 - 1500 event sample lead-lead

- Calculate yields of each particle type
 - (assumptions on initial number of events from which the sample has been extracted
 - correction factors for efficiency)

Excercise 2

Transverse momentum spectra

Transverse momentum spectra

transverse momentum spectra of unidentified, primary charged particles

- yield increases from pp to Pb-Pb collisions
- yield increases from peripheral to central Pb collisions
- spectral shape seems change as well

how can this be quantified?

Nuclear modification factor RAA

- divide spectrum measured in Pb-Pb by spectrum from pp scaled with the number of equivalent pp collisions, $\langle N_{\text{coll}} \rangle$

- nuclear modification factor

$$R_{AA} = \text{yield}(Pb-Pb) / \langle N_{\text{coll}} \rangle \text{yield}(pp)$$

- $R_{AA} = 1$ if a Pb-Pb collision is equivalent to $\langle N_{\text{coll}} \rangle$ independent pp collisions

- ALICE: $R_{AA} < 1$ with a strong centrality and p_T dependence!

Large scale analysis: result

IPPOG Masterclass Held At Heidelberg

by Rainer Schicker. Published: 16 March 2012
 Masterclasses IPPOG Heidelberg ALICE

Each year the International Particle Physics Outreach Group (IPPOG) organises a student Masterclass programme with high energy physics institutes. Kirchoff-Institute at Heidelberg University, Germany, an ALICE member, held their Masterclass in early March. The classes allow students of 17 - 18 in age to visit a research institute and to analyse real physics data. Contributing institutes then connect with each other via videoconference, allowing the students to discuss their results, methods, and experience. The aim of the classes is to encourage enthusiasm for and increase knowledge of high energy physics in potential young scientists.

Rainer Schicker, of the Physikalisches Institute, Heidelberg, summarises their Masterclass:

Rainer Schicker

The Masterclass Students Heidelberg University

The Heidelberg ALICE Masterclass took place on March 6th at the Kirchoff-Institute. About 30 students participated in this Masterclass, in which the main theme was the creation of the universe. The programme started in the morning with an overview of astrophysical measurements of cosmological significance, such as the Hubble constant, microwave background, and the rotational

2012 ALICE Masterclasses

by Polly Bennett. Published: 30 March 2012
 IPPOG ALICE Masterclasses

The ALICE Masterclasses took place on March 22nd as part of the 'International Masterclasses: Hands on Particle Physics' programme run by IPPOG, the International Particle Physics Outreach Group. In a visit to CERN, high school students from the Lycée International de Ferney were provided with an introduction to CERN and the ALICE experiment before carrying out an exercise analysing real ALICE data. The day finished with a light-hearted quiz in the style of the game show 'Who Wants To Be A Millionaire?'

The analysis session took place at the CERN Training Centre. Working in pairs, and by using a simplified version of the ALICE event display, the pupils analysed data from proton and lead ion collisions recorded by ALICE last year. The aim of the exercise was to hunt for strange hadrons by identifying cascade and Λ decays.

Polly Bennett

The students during the analysis session

IPPOG aims to increase knowledge, understanding and enthusiasm for particle physics through outreach activities, of which the Masterclasses are the flagship event. The cornerstone of the Masterclass events is a videoconference, with other participating school
