

Summary for the discussion on V+jets

G. Brandt, V. Ciulli, A.-M. Magnan, A. Messina

- Critical items to be addressed in the working group to help experimental to theory comparison and ATLAS/CMS combination
 - Theory/model systematics: from the scale choice to the underlying event tune. Can we agree on a way to estimate the uncertainties? Could it be independent from the specific generator used?
 - NLO calculations:
 - which steps must be considered for parton to hadron corrections?
 - how to deal with inclusive quantities, like HT?
 - Kinematic phase space: can we define a common one and evaluate the corrections to it?
 - cone size
 - jet rapidity range
 - Observables: what else should we consider?
