Measurement of jet spectra with charged particles in Pb-Pb collisions at $\sqrt{s_{NN}}=2.76$ TeV with the ALICE detector at the LHC

Saturday 18 August 2012 10:00 (10 minutes)

We report a measurement of transverse momentum spectra of jets detected with the ALICE detector in Pb-Pb collisions at $\sqrt{s_{NN}}=2.76$ TeV. Jets are reconstructed from charged particles using the anti- k_T jet algorithm. The transverse momentum of tracks is measured down to 150 MeV/c which gives access to the low p_T fragments of the jet. The background from soft particle production is determined for each event and subtracted. The remaining influence of underlying event fluctuations is quantified by embedding different probes into heavy-ion data. The reconstructed transverse momentum spectrum is corrected for background fluctuations by unfolding. We compare the inclusive jet spectra reconstructed with radii between 0.2 and 0.4 for different centrality classes and compare the jet yield in Pb-Pb and pp events.
