Microcanonical Tsallis statistics in jet fragmentation at LHC and LEP

Thursday 16 August 2012 16:00 (2 hours)

For the description of hadronic spectra in high-energy nuclear reactions, it is essential to understand the process of hadronisation. However, hadron creation is still an unsettled matter from the theoretical point of view.

In the talk, I show that hadron distributions inside jets (fragmentation functions) created in $\sqrt{s} = 7$ TeV (LHC) proton-proton [1] and also in high-energy electron-positron [2] collisions can be described by a statistical jet-fragmentation model. This model combines microcanonical statistics and super-statistics induced by multiplicity fluctuations. The resulting scale dependence of the parameters of the model turns out to be similar to what was observed in electron-positron annihilations in Ref. [2].
