# LAGUNA-LBNO: goals

- next generation long baseline experiment → better sensitivity w.r.t. T2K and NOvA
- observe Mass Hierarchy, through matter effect, and CP-Violation
- sign of  $\Delta m^2$  and  $\delta_{CP}$  to be measured directly from the oscillation analysis
  - large detectors + intense  $\nu$  beam → high statistics
  - very long baseline → break Mass Hierarchy- $\delta_{CP}$  degeneracy, measure 1<sup>st</sup> and 2<sup>nd</sup> oscill. maxima
- extended nucleon decay search: probe BSM physics up to GUT scale
- sound atmospheric and astrophysical neutrino program

A new massive deep underground neutrino observatory for long baseline neutrino studies, capable of proton decay searches, atmospheric and astrophysical neutrino detection

# LBNO goals

Better sensitivity w.r.t. T2K+NOvA:

## Beam

Fully exploit long baseline neutrino oscillation pattern

perform L/E analysis over large energy range  
(1<sup>st</sup> and 2<sup>nd</sup> maxima)

Wide Band Beam (WBB)

$$E_{\nu}^{2\text{nd max}} > 500 \text{ MeV} \rightarrow L > 1000 \text{ km}$$

## Detector

Better signal efficiency and background rejection  
with a comparable mass

20 kton fine sampling tracking device

$$A_{CP}(\rho) \equiv \text{abs} \left( \frac{P^{\text{mat}}(\nu) - P^{\text{mat}}(\bar{\nu})}{P^{\text{mat}}(\nu) + P^{\text{mat}}(\bar{\nu})} \right)$$

$$A_{CP}^{\text{vac}}(\delta_{CP}) \equiv \text{abs} \left( \frac{P^{\text{vac}}(\nu) - P^{\text{vac}}(\bar{\nu})}{P^{\text{vac}}(\nu) + P^{\text{vac}}(\bar{\nu})} \right)$$

# The LAGUNA consortium

Large Apparatus studying Grand Unification and Neutrino Astrophysics

- ✓ 2008-2011: Design Study
  - EU funding FP7
  - 100 members, 10 countries
  - search for optimal site in Europe
    - detailed investigation of 7 candidate sites
    - **Pyhäsalmi mine, Finland**
- ✓ 2011-2014: LBNO
  - EU funding FP7
  - 300 members, 14 countries
  - extended site investigation

# The Pyhäsalmi mine

- Available for since from 2016
- Efficient infrastructures already present
- Little environmental water
- Deepest mine in Europe: ~1400m, 4000 m.w.e.
- Rock quality suitable for excavation of large volumes
- Lowest reactor neutrino background in Europe
- Distance from CERN (2288km)
- Interesting distance from other potential neutrino sources
  - DESY(1500km), Protvino(1160km), RAL(2300km)
- Distance compatible with NF setups

# The Far underground detectors

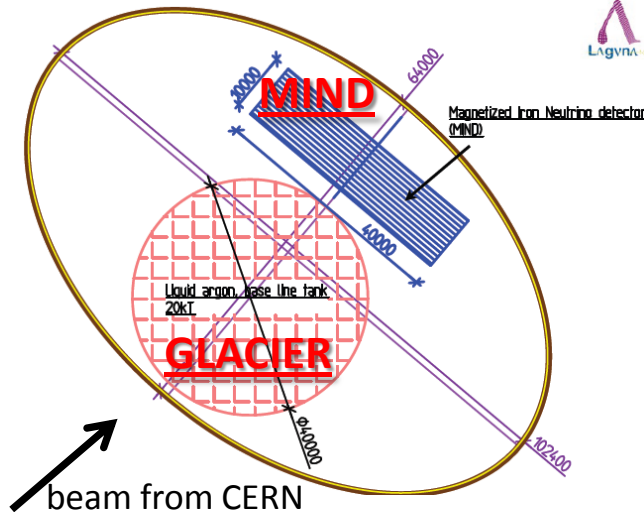

## GLACIER

20 kt Double Phase LAr LEM TPC

- ✓ Low energy threshold: exclusive final states
- ✓ Low systematic error
- ✓ Excellent energy resolution on a wide energy range
- ✓ Excellent  $\pi^0/e$  separation: necessary to suppress NC background, higher for on-axis beam

➤ Electron appearance measurements

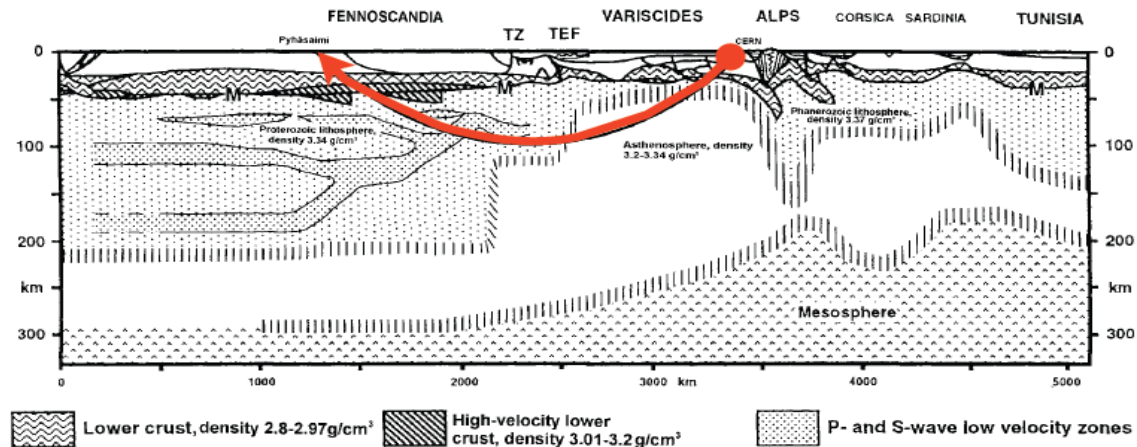

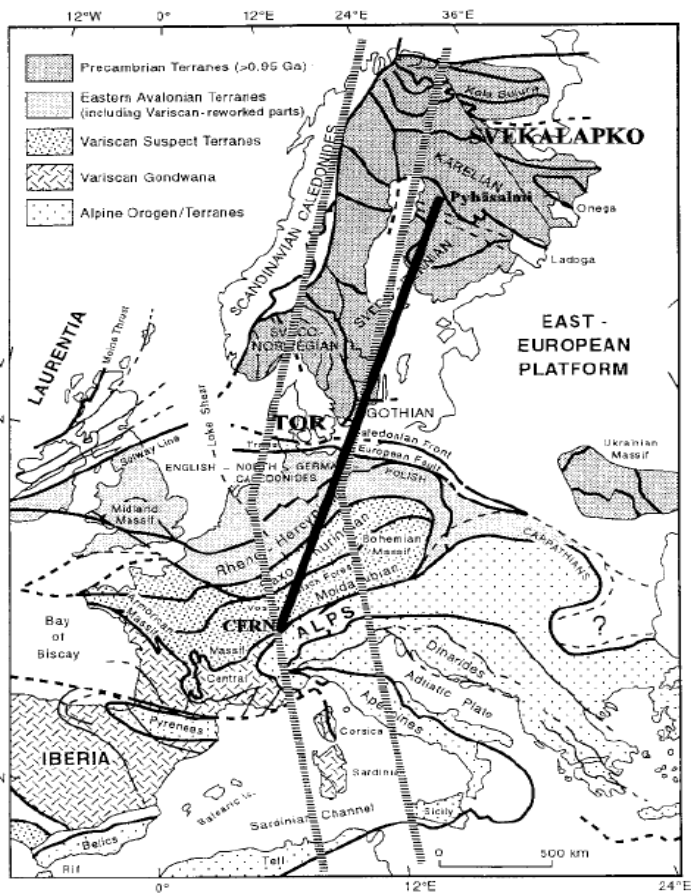

## MIND

35 kt Magnetized Muon Detector  
(3 cm Fe, 1 cm scint. bars, 1.5-2.5 T)

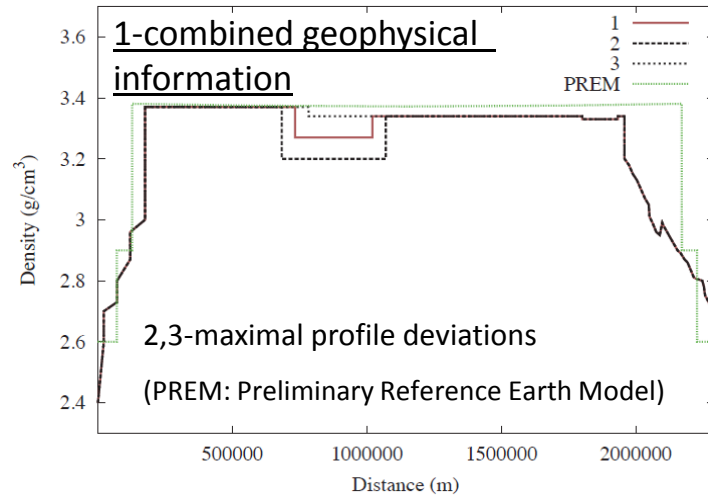

- ✓ Muon momentum and charge
- ✓ Inclusive neutrino energy rec.

➤ Muon CC, NC measurements

# Matter density along the baseline

**Earth Density Profile**  
 Measured by several  
 Geophysical projects  
 $2.4 < \rho < 3.4 \text{ g/cm}^3$

- ❑ The  $v$  line of flight is comprised in a geological section extensively studied in the past
  - mean density variations known with high accuracy
- ❑ Local density variations are estimated to be of about 5%
  - total effect on oscillation probability averages out
  - conservative approach is to assume  $\pm 4\%$  syst. error (global mean shift)

# CERN→Pyhäsalmi: $\nu_\mu \rightarrow \nu_e$ Oscillation Probability

Normal Mass Hierarchy ( $L=2300$  km)

$$\sin^2(2\theta_{13}) = 0.09$$

# CERN→Pyhäsalmi: $\nu_\mu \rightarrow \nu_e$ Oscillation Probability

Inverted Mass Hierarchy ( $L=2300$  km)

$$\sin^2(2\theta_{13}) = 0.09$$

# LAGUNA-LBNO new neutrino beam line

## ✓ *CERN-to-Pyhäsalmi (CN2PY) neutrino beam*

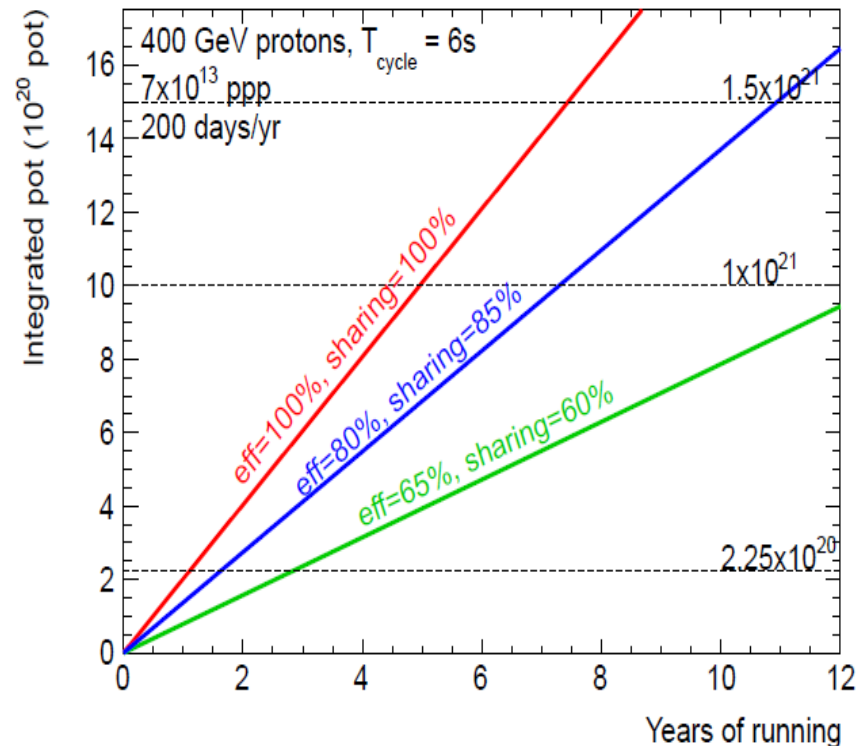

- Design optimized target and focusing systems
- Near detector needed to achieve required systematic
- Consider dedicated set of hadro-production experiment

## ✓ *Benefit from improved SPS+Injectors*

- SPS intensity is upgraded to  $7 \times 10^{13}$  p.p.p. @ 400 GeV (6 s cycle)
- 1 year integrated p.o.t.: 0.8-1.3  $1 \times 10^{20}$
- 12 year integrated p.o.t.: 1-1.5  $10^{21}$
- Corresponding sharing: 60-85%
- Studies ongoing with CERN acc. team

## ✓ *Upgraded path. Options*

- SPS Upgrade (800 GeV) → 2MW
- New HP-PS accelerator (50 GeV) → 2MW
- NeutrinoFactory storage ring

# Neutrino beam tuning

Beam line parameter varied in order to find the configuration which maximize the information extracted from the analysis of the oscillation spectra

Decay Tunnel dimensions  
 Target-Horn position  
 Horn-Reflector Position  
 Horn(Reflector) shape  
 Horn(Reflector) current

.....

# Near detector & hadro-production experiment

Systematic error on the signal and background in the Far detector  $\sim 2\%$

Precise knowledge of fluxes, cross sections...

*Near Detector*

- ✓ Argon TPC (10 bar)
- ✓ Scintillator bar tracker
- ✓ Magnetic Field: 0.5 T
- ✓ 0.2 event/spill @ 700 kW

*NA61/SHINE*

- ✓ Input from hadro-production experiment crucial for precise neutrino experiment (K2K, T2K, MINOS)

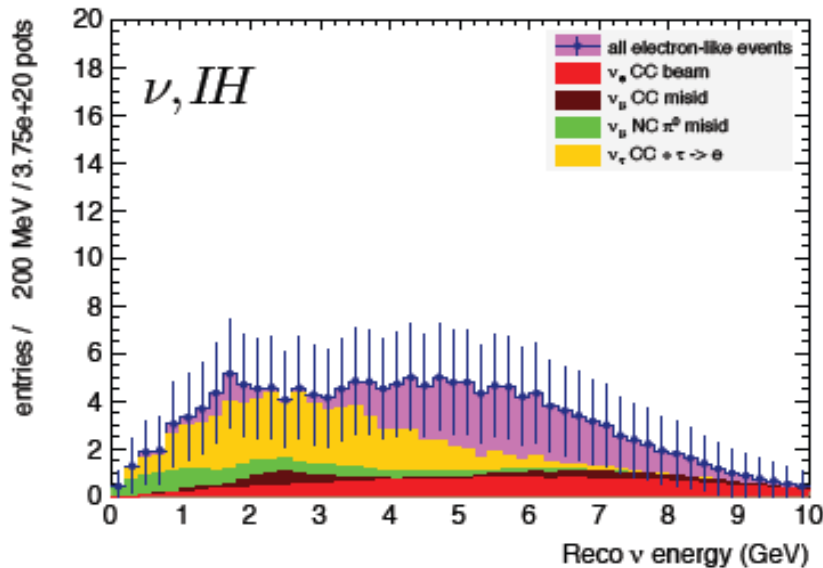

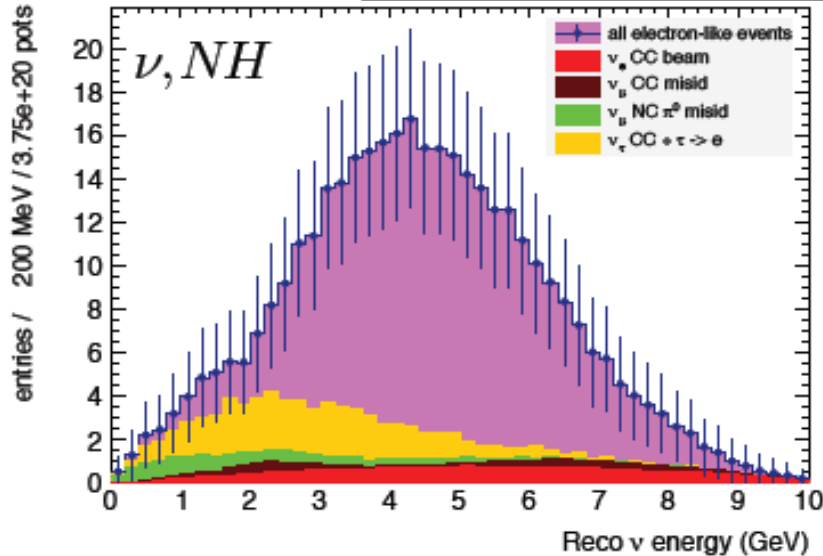

- CERN NA61 acceptance study

# Mass Hierarchy with neutrino/anti-neutrino

Running mode  
 $\nu/\bar{\nu}$ :25%/75%

Detector response and resolution included

# Sensitivity to Mass Hierarchy & CP-Violation

Neutrino energy reconstructed from final state events.

$\nu_\tau$  background treated with kinematical analysis.

Integrated p.o.t.:  $1.5 \times 10^{21}$

Target Mass: 20 kton

Running mode: 25%:75% sharing neutrino:anti-neutrino

Systematic errors

- signal normalizations: 5% ( $\nu_\tau$ :50%)
- horn polarity: 5%
- NC, CC background: 5%
- matter density: 4%

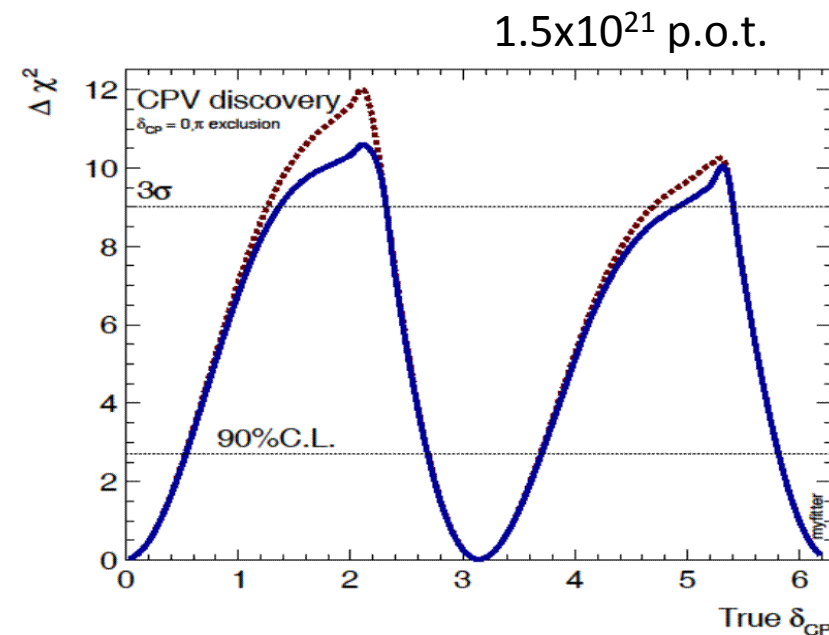

• Mass Hierarchy determination at  $5\sigma$  in few years

• CPV  $\sim 60\%$  coverage 90% C.L. end evidence for maximal  $\delta_{CP}$  ( $\pi/2, 3/2\pi$ ) in 10 years

➤ CPV sensitive to systematic effects

➤ In case of negative result

With a factor of 3 higher exposure (beam power  $\times$  far detector mass) CPV evidence achievable for 75% of the  $\delta_{CP}$  parameter space.

# Conclusions

- ❑ Long Baseline Neutrino Oscillation experiment between Pyhäsalmi and CERN (2300 km):
  - all transitions (e,  $\mu$ ,  $\tau$ ) measurable in neutrino/antineutrino in the same experiment
  - conclusive Mass Hierarchy determination
  - Very good chance to find CPV from spectral information.  
With 10 years at 700kW SPS and 20kton LAr: 60% coverage 90% CL  
Three-fold exposure lead to 75% coverage at  $3\sigma$
  - > 10 times better sensitivity on several nucleon decay channel
  - detection capability of several astrophysical sources
  
- ❑ EoI submitted to CERN-SPSC in June 2012

backup

# Layout of the LAGUNA-LBNO observatory at Pyhäsalmi (-1400m)

Necessary space for  
2x50 kton LAr + 50 kton LSc  
500'000 m<sup>3</sup> excavation  
Design to be finalized within  
LAGUNA-LBNO by ≈2014

# Why the neutrino mass hierarchy ?

- **CP-violation:** necessary input to solve CPV problem. For example, for the HyperK LOI arxiv:1109.3262 (which considers a 540kton FV and hence has the highest statistical power):
  - 3 MW×years (note: >10 years at present JPARC MR power) MH known: 65% coverage → MH unknown: 35% coverage
  - 10 MW×years needed to reach 65% coverage if MH unknown! rather unlikely within present JPARC projections.
- **$0\nu\beta\beta$  searches:** necessary input to interpret both negative and positive isotope lifetime results, in terms of neutrinos (as opposed to some other source of lepton number violation).
- **BSM/GUT theories:** important ingredient for model building. An inverted hierarchy would have interesting implications.
- **We need a definitive & conclusive determination of the MH !**

# Real cosmic rays in LAr LEM-TPC

*Cosmic track in double phase 80x40cm<sup>2</sup> LAr-LEM TPC with adjustable gain :  $S/N > 100$  for m.i.p !!*

# Neutrino energy reconstruction

- nue CC events generated with GENIE and CN2PY fluxes
- GEANT4
- CCNuE resolution: **8.7% RMS for vertex in center of detector**
- Preliminary result:  **$(E_{\text{dep}} - E_{\text{reco}})/E_{\text{dep}} \approx 0.7\%$  RMS**

top view of detector

deposited energy in fiducial volume

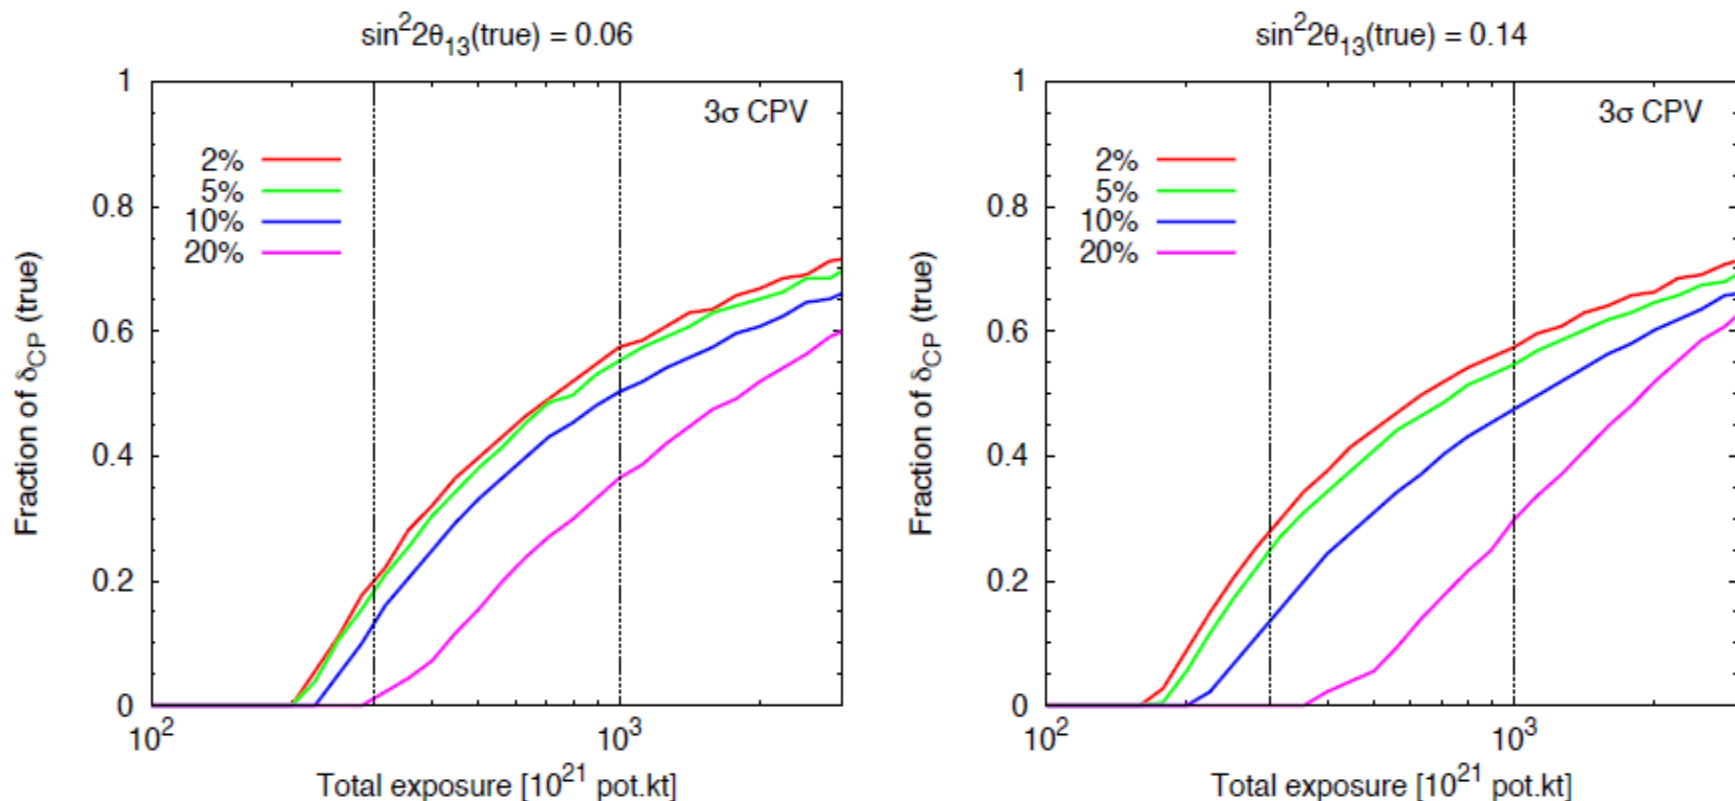

neutrino energy

**CCNuE resolution**  
(vertex in center of detector): **8.7% RMS**

# Matter uncertainty and CPV discovery

Assuming 5% systematic errors on signal and background:

If we start from 2% systematic error on matter density:

- Going to 5% we lose  $\sim 2\%$  CPV coverage, for all exposures.
- Going to 10% we lose  $\sim 5\%$  CPV coverage.
- Going to 20% (unrealistic) we lose  $\sim 20\%$  CPV coverage.

# Matter uncertainty and CPV precision

- 2% and 5% similar.
- Lose a little going to 10%.
- Large difference for 20% (unrealistic).

# LBNO Expression of Interest

- ★ 20 kton double phase LAr LEM TPC (GLACIER) and magnetized muon detector (MIND design)
- ★ Conventional neutrino beam line with a baseline of 2300 km towards Pyhäsalmi, Finland (CN2PY) with protons from CERN SPS 700kW upgrade
- ★ Initial (Phase 1) physics goals:
  - Measure all transitions ( $e/\mu/\tau$ ) and determine precisely oscillation parameters
  - Achieve a  $>5\sigma$  C.L. determination of the neutrino mass hierarchy in a few years
  - Explores a significant part of the CPV parameter space, namely 60% CPV coverage at 90% C.L. in about 10 years running
  - Proton decay, atmospheric and astrophysics neutrinos:
    - 5'600 atm events/yr  $Br(p \rightarrow \bar{\nu}K) > 2 \times 10^{34}y(90\%C.L.)$
    - relic SN, WIMP flux, ...  $Br(n \rightarrow e^-K^+) > 2 \times 10^{34}y(90\%C.L.)$
    - $>10'000$ 's nu-int. @ SN explosion@10kpc
- ★ Phase 2 (>2025): Pyhäsalmi situation and distance allow upgrade into larger detector(s) and a more powerful beams (e.g HP-PS 2MW or NF) and thus, offers a long term vision.
  - For example, with a three-fold increase in exposure, it reaches 75% CPV coverage at  $3\sigma$  C.L.
- ★ Expression of Interest for CERN scientific committee in preparation (submission 20/6/2012)

# GLACIER detector design

- ★ Concept unchanged since 2003: Simple, scalable detector design, from one up to 100 kton (hep-ph/0402110)
- ★ Single module non-evacuatable cryo-tank based on industrial LNG technology
  - industrial conceptual design (Technodyne, AAE, Ryhal engineering, TGE, GTT)
  - two tank options: 9% Ni-steel or membrane (detailed comparison up to costing of assembly in underground cavern)
  - three volumes: 20, 50 and 100 kton
- ★ Liquid filling, purification, and boiloff recondensation
  - industrial conceptual design for liquid argon process (Sofregaz), 70kW total cooling power @ 87 K
  - purity < 10 ppt O<sub>2</sub> equivalent
- ★ Charge readout (e.g. 20 kton fid.)
  - 23'072 kton active, 824 m<sup>2</sup> active area
  - 844 readout planes, 277'056 channels total
  - 20 m drift
- ★ Light readout (trigger)
  - 804 8" PMT (e.g. Hamamatsu R5912-02MOD) WLS coated placed below cathode
- ★ The concept and the designs are reaching the required level of maturity for submission to SPSC.

# GLACIER charge readout

- A. Badertscher, et al., NIM A 641 (2011) 48-57

- See also arXiv:1204.3530 [physics.ins-det]

★ Novel double phase LAr LEM-TPC readout:

- ionization electrons are drifted to the liquid-gas interface
- if the E-field is high enough ( $\approx 3$  kV/cm) they can efficiently be extracted to the gas phase
- in the holes of the LEM the E-field is high enough to trigger an electron avalanche
- the multiplied charge is collected on a 2D readout
- gain allows **sharing charge in collection mode for both views!!**

Design of a compact, robust and scalable readout cassette (“sandwich”)
