Studies of exotic charmonium and bottomonium states with the CMS experiment

Thursday, 5 July 2012 12:00 (15 minutes)

CMS has searched for exotic charmonium states in the data sample collected in proton-proton collisions at 7 TeV in 2011. The $X(3872)$ state is reconstructed in the $J/\psi \pi^+ \pi^-$ decay channel and the production cross-section is computed by determining the ratio to $\psi(2S)$ production in the same decay channel. For the first time, prompt and non-prompt contributions to the $X(3872)$ cross section are disentangled by looking at secondary vertices. Furthermore, we also report on searches for other exotic quarkonium states.

Primary author: YI, Kai (University of Iowa (US))

Presenter: ULMER, Keith (University of Colorado at Boulder (US))

Session Classification: TR5 & TR7 - Room 220 - B Physics and CP Violation, etc.

Track Classification: Track 7. CP Violation, CKM, Rare Decays, Meson Spectroscopy
